HAY PRESSES!

THE HURRICANE—Size A.

A mounted, horizontal double-ender. Size of bale, when in the press, 17x22x40 inches. Average weight of bale, 220 pounds. Capacity, from 16 to 25 tons per day. Uses 4 men and works with 2 horses. Requires no TRAMPING. Puts 10 tons or over in a box car.

Price.....\$1000.

THE HURRICANE—Size B.

Size of bale in press, 22x24x46 inches. Average weight of bale, 260 pounds. Capacity, from 20 to 35 tons per day. Uses 5 men and works with 1 or 2 horses, at option of baler. Requires no TRAMPING. Uses rope or wire. Puts from 7 to 8 tons in a box car.

Price.....\$1000.

The SELF-TRAMPING JUNIOR MONARCH

Size of bale in press, 22x24x46 inches. Average weight of bales, 260 pounds. Capacity, from 15 to 25 tons per day. Uses 3 or 4 men, at option of baler. Works with 1 or 2 horses. Uses rope or wire. Does its own TRAMPING. Puts from 7 to 8 tons in a box car.

Price.....\$500.

THE MONARCH.

Same principle as Junior Monarch, only smaller and heavier. Size of bale, when in press, 17x20x40 inches. Average weight of bale, 220 pounds. Capacity, from 12 to 20 tons per day. Requires 3 men and 2 horses. Uses wire only—rope will not hold. Does its own TRAMPING. Puts 10 tons or over in a box car.

Price.....\$600

THE GENUINE PRICE PETALUMA.

Size of bale in press, 24x24x50 inches. Average weight of bale, 250 pounds. Capacity, from 10 to 18 tons per day. Requires 4 men and 2 horses. Uses rope or wire. Hay has to be tramped into the press. Puts from 5 to 6 tons in a box car.

Price.....\$350.

THE IMPROVED EAGLE.

Size of bale in press, 26x26x60 inches. Average weight of bale, 235 pounds. Capacity, from 10 to 15 tons per day. Requires 4 men and 2 horses. Uses rope or wire. Hay must be tramped in the press. Puts from 4 1/2 to 5 1/2 tons in a box car.

Price.....\$250.

The above is the finest line of Baling Presses in the United States. They are nearly double the capacity of those of other makers.

Government Land Surveys.

There is no doubt that settlement is restricted and settlers who have the courage to go forward are much embarrassed by the impossibility of obtaining authoritative surveys of the land to which they desire to secure title. This matter has been frequently discussed, and Pacific Coast representatives have endeavored to secure further surveys, but so far without avail. Even the proposition for the settler to advance cost of surveying does not work, because, it is alleged, the rates allowed by the Government are too small to compensate a surveyor for dragging his chain.

This matter has recently been the occasion of renewed correspondence between our local land offices and the Washington office, and last week a letter was received in this city in which it was stated that applications for public surveys could be received, and on approval of such applications by the Washington office, the local office can make estimates for deposits; but "all estimates must be based upon the existing legal rates of mileage, namely, \$9, \$7 and \$5 for standard and meander, exterior and subdivisional lines."

It is said that no surveyor will accept these rates, so the application becomes of no avail. Formerly, the department allowed special and augmented rates, but these have been forbidden by recent instructions, and the deputies are not permitted to receive any extra pay from settlers whose land they survey. Much settled land in this State will remain unsurveyed until the work of surveying is made reasonably profitable.

An interesting question as to whether a single woman who takes up land may marry without forfeiting her contract with the Government has lately been under consideration. There seems to be a doubt whether she can hold a pre-emption under these circumstances. It is now the law that when a single woman, claiming land by homestead right, marries, such marriage does not disqualify her from perfecting her right, if she continues to live on the land. It is a matter of great interest to the single women in the West who are holding land under the pre-emption law, whether the Commissioner will make any distinction between a pre-emption and a homestead claimant. This is the first time this question has ever been raised in the San Francisco Land Office.

Grain Bags.

The price of bags is not nearly so interesting a matter as it was a few weeks ago, for the unfavorable turn of the season has dissolved all bag corners and combinations. They are water-proof concerns and flourish when the floods are high, but crack all to pieces in a drouth. It is interesting, however, to know that the State's prison factory has gone along with its work, unaffected by rain or shine.

think it is advisable to contract for 1500 bales to be brought by way of Hongkong. I have secured 100 bales more than our shipment by the Falls of Clyde at the most reasonable rates, which gives 6600 bales for our new stock.

This is good news, for if we get a short grain crop this year, we shall expect a long one next year, and it will be well for the State factory to go on piling up the stock, subject to farmers' orders and not for sale to corners. The prison supply thus will act as a safety guard against extortion and at the same time will relieve the

A Fine Clyde.

We have had a number of fine portraits of Clydesdale horses, but has there been any more handsome than the one which adorns this page? It is indeed a moving representation of a grand animal, full of life and grace and force. It is in fact such an animal as we would expect to see from a review of his record.

Gilderoy (1438) 2826 was foaled in April, 1878. He was bred by Mr. Duncan, Kirkton,

Deskford, Banffshire, Scotland, and owned for several years by Mr. McRobbie, Sunnyside, Aberdeen. He was imported in 1886 by Galbraith Bros., of Janesville, Wis. He is bay with white mark on face and hind legs white over pasterns.

Gilderoy began his notable work as a prize-winner as a three-year-old. He won the £50 prize given by the Nairnshire Farmers' Club, first prize and silver medal at the Royal Northern Agricultural Society's Spring Show at Aberdeen and first prize at the same society's Summer Show in 1881. In 1882 he won the £100 prize given by the Buteshire Farmers' Society. In 1883 he gained the Highland and Agricultural Society's premium of £115 at Glasgow. In 1884 he was awarded the Glenkens, Balmaghie and Parton Horse-Breeding Society's

CLYDESDALE STALLION GILDEROY, IMPORTED IN 1886 BY GALBRAITH BROTHERS.

Warden McComb in his report to the directors May 12th says:

I have the honor to report that the bag factory has been operated to the full capacity of the looms, with relays of operatives, until two days ago, when all the raw jute in our possession was converted into burlaps. The demand for grain bags was very brisk while the crop prospects were good, and our product was sold as fast as it could be manufactured. During the long-continued dry spell the demand has been very light, and I have accumulated enough to fill orders promptly as soon as the farmers decide how many bags will be needed for their respective crops. The farmers will have the advantage of lower prices for grain bags for the remainder of the season, as it is quite evident that the combination has not succeeded in the attempt to control the market by pooling their stocks to withdraw a portion of them from sale. The farmers are now fully aware that they can write to the warden of the prison and buy their sacks at the lowest current prices.

The 6500 bales of raw jute purchased for the bag factory will keep the mill employed for about 10 months, and will consequently leave a gap of two months next year unless we secure enough by steamer freight to last until the arrival of the sailing fleet from Calcutta, and I

people from taxes to support the convicts. The bag factory at the prison seems to be working well for the public benefit, so far, at least.

A FLORAL FREAK.—Mr. N. C. Whyte lately left with us three roses, grown on two adjacent bushes at his place in Oakland, which afforded an interesting example of cross fertilization. One was a handsome specimen of the green rose; another, a symmetrical pink rose—variety uncertain; and the third, which grew upon the same bush with the second, on the side toward the other bush, appeared to be a mixture of the two varieties, having a number of its petals smooth and rosy-hued, while others were greenish and crinkly. It was quite a curiosity in the hybrid line.

THE San Francisco sub-treasury now contains between \$56,000,000 and \$57,000,000 in coin. A count of the money is now in progress.

IN the cattle ranges south of Elko, Nevada, the feed is said to be more abundant than for six years past.

premium of £100. In 1885 he won the Dalbeattie Horse-Breeding Society's premium of £100 and fourth prize at the Highland and Agricultural Society's show at Aberdeen. In 1886 he was awarded the Kirriemuir Horse-Breeding Society's premium. He has been in the short list at the Glasgow Stallion Show for the last five years.

After his victory at home in 1886, Gilderoy was purchased by Galbraith Bros., the well-known importers and breeders of Janesville, Wisconsin. Within a few weeks of landing in America he was exhibited at the Interstate Fair at Madison, Wis., where he won first premium, also first premium the following week at the Wisconsin State Fair, held at Milwaukee, Wis., and 3d prize in a strong class at Chicago Fair. We have not at hand his later records.

Galbraith Bros. have long been liberal purchasers of the best British stock, and the *Mark Lane Express* recently alluded to them as owning "perhaps the largest, if not also the best, collection of British horses in America."

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Travels in Tulare.

EDITORS PRESS:—In traveling eastward from the head of Tulare lake on the north to the foot of the Sierra Nevada mountains, the writer has taken a few notes, some of which he submits for the consideration of your readers.

The grain crops about Lemoore, which is situated in the western part of Lucerne valley, are less promising than they have been for many years. Up to about March 1st they looked well, but the entire absence of spring rains has caused the grain to dry up in many instances before it had become sufficiently matured to be worth cutting for hay.

Alfalfa, however, looks well, and there will be considerable fruit, although the late frosts cut off most of the apricots and a few of the early peaches.

We pass out from Lemoore into the Grangeville country, where the rich soil so well irrigated from numerous ditches will yield very fair crops of all kinds.

In the vicinity of Hanford many fields of good grain can be seen where water from irrigation ditches has been used unsparingly, but some of the farmers having used little or no water, will harvest very poor crops of grain.

One and a half miles east of Hanford is situated the very productive and well-kept farm of Mr. Vincent E. Hill. This gentleman is an Englishman by birth and education, and having had some experience in butter and cheese-making in that country, he is preparing to engage somewhat extensively in the same business here.

Mr. Hill prefers the Shorthorns to either the Holsteins or Jerseys for dairy purposes, and has been for four years breeding his cattle into that stock. Last fall he purchased from Robert Ashburner of San Mateo a thoroughbred bull calf at a cost of \$175, besides freight charges. The writer thinks this young animal is as fine a specimen of the bovine species as he ever looked upon.

Six miles northeast of Hanford lies the farm of Mr. Elias Gallup, who is one of the best-known fine stock-breeders in the Upper San Joaquin. The many premiums that he has received on his fine hogs at different fairs for many years past have given him a reputation of high rank in that line, but of recent years he has also given much attention to breeding fine cattle to sell to breeders and to dairymen. Unlike Mr. Hill, he gives preference to the Holsteins for dairy purposes, and has not long since purchased a thoroughbred bull of that stock from H. W. Meek of San Lorenzo, at a cost of \$300. He is a two-year-old bull, by name Golden Gate, sired by Minstrel, dam Alameda Maid. Mr. Gallup expects soon to be able to compete with any cattle-breeders in the State.

In the extreme eastern part of the valley of Lucerne, ten miles northeast of Hanford, the writer had the pleasure of passing one night under the hospitable roof of Mr. D. C. Hayward, who resides on his fine stock farm of 800 acres. Prior to the construction of the numerous irrigation ditches taking water out of King's river, this farm was overflooded each winter, which circumstance has rendered the soil very rich and productive, and now very valuable since it no longer overflows. Mr. Hayward has about 300 head of cattle, many of which are choice dairy cows. He, like Mr. Gallup, prefers the Holsteins for dairy purposes, and is breeding his whole herd into Holsteins as rapidly as possible. Looking to this end, he purchased for his own use, two months ago, a thoroughbred bull of this breed two years old from Senator Stanford's herd, at a cost of \$300. Mr. H. is now building a cheese factory, and intends to engage in the business of cheese-making quite extensively in the near future. This gentleman is also making a fine showing in the breeding of horses for draft and for road purposes.

He now owns and keeps on his place two stallions six years old, imported two years ago from France by Theodore Skillman of Petaluma.

One is a coach horse whose registered name is Elector. He is 16 hands high and weighs 1400 pounds, in color a bright bay; the other is a Norman, whose registered name is Cheri, a coal-black, weighing 1680 pounds. Both are splendid specimens of their kind, and are very valuable for breeding purposes.

Mr. H. has a field of fine young horses which it is really a pleasure to see, and most certainly they are a credit to their owners and to Lucerne.

The gentlemen thus far named by me are all subscribers and close readers of the RURAL, and do not hesitate to speak in the highest terms of your paper, and to extend a cordial welcome to your representative. Soon after leaving Mr. Hayward's farm, in an easterly direction, one passes out from the beautiful and most fertile valley of Lucerne on to an alkali plain, which seems to be worthless for all other purposes than to furnish pasturage for jack-rabbits.

Over this apparent desert you continue for eight miles, and until you enter the town of Traver. Leaving Traver, you enter into the '76 country, which takes its name from an irrigating canal that brings water out of King's river 30 miles above, in Fresno county.

The '76 is a wheat country exclusively, and I presume what may be called half a crop will be harvested there this year, at least no more.

Near the town of Traver, in a northeasterly

direction, are three separate colonies in which fruit-growing is the principal industry, but the business is in its infancy, scarcely any of the trees or vines being yet in a bearing condition.

At the eastern boundary of the '76 country lies the new town of Sibly, situated on the eastern branch of the S. P. R. R. now in process of building, and which skirts the foothills from King's river to Porterville. Sibly is in a beautiful location, and a thriving town will probably be built there soon. We then pass out of the irrigated district, and after traveling eastward four miles enter Stokes valley, which has a national reputation for its early fruits.

The grain crops throughout all the country east of Sibly are just about good enough to pay for harvesting, save a few spots where nothing will be gathered.

Stokes Valley

Is a beautiful nook running back among the foothills of the Sierras 20 or more miles from Visalia. It is about eight miles long and four miles wide, high hills covered with timber and which rise abruptly from the plain surrounding it on three sides.

Near the head of this valley on the northern side in a sheltered cove is the home of Horace Whitaker, a most beautiful spot, where he produces some of the earliest and finest fruits grown in the State. At the head of the valley on the north side is situated the fine farm of Mr. W. C. Courtner, an excellent farmer and most hospitable gentleman. Mr. Courtner has several hundred acres of fine grain land; he is also engaged in stock-raising, and last year produced the earliest figs grown in the State.

In the northeast corner, at the very head of the valley, is the famous Thomas & Boyd orchard, which was planted and cultivated by I. H. Thomas of Visalia, and from which, for many years, he has gathered the earliest peaches and apricots found in the San Francisco markets. Oranges are also successfully grown here, and with proper facilities for irrigation, which will probably be had soon, the whole valley will blossom with the orange, the vine, and the fig tree, and become one of the most beautiful as well as most healthful spots on earth.

A. F. JEWETT.

Stokes Valley, May 6, 1888.

Yolo County Notes.

EDITORS PRESS:—As it has been some time since our county has been reported, I take pleasure in so doing now. I can say that grain and fruit prospects are good. It is true that there are some "spots" where grain sown in winter will be light, but the summer-fallow is good everywhere, even in the "hills" on the west of the county. A gentleman who has grain in Hungry hollow (our dry part of the county) told me last evening that the prospect up there was never better. But of all places, the river ranchers will harvest the crop this year. There have been no floods to interfere and the grain never looked finer, including even volunteer. Haying is pretty well under way. As to amount of acreage being out, am not able to say, but as regards quality, can say that it is good, not a superabundance of straw, but just right.

As it is generally known that our rainfall has been a little over 12 inches for the season, it might have been interred that we were having a drouth, but such is happily not the case. As the rain came gently, it all stayed in the soil, thoroughly moistening it and bringing about the best results possible with the amount that was precipitated. Too much rain at a time is worse than not enough in our locality, as it settles the soil very hard and firm, destroying the tilth and increasing evaporation, causing the grain to lack kernels at the top of the head.

Fruits.

Peaches are plenty as far as I can learn, but apricots are rather below an average. The Moorpark bloomed in time to be caught by a late frost. After the frost a few blooms came out and a few apricots were the result, but most of them have fallen off. I must award the prize to the Routier or New Peach apricot again this year for productiveness. It is a constant bearer, and there is no better for drying and for general purposes. The fruit is not so sweet as the Moorpark, and it is not so juicy, which makes it a better shipper.

What Are They?

We have several varieties of apricots in this section that we do not know any name for. I will try and describe three of them, and if any one can give us any light on the subject, we would be thankful. It has been told me that the buds came from Mr. W. N. Smith's orchard at Vacaville. Perhaps if that is so he may know the names. The first variety ripens next after the Pringle. The tree looks very much like the Routier, only it is more of an upright grower, very vigorous; leaf, same shape and a shade lighter green; bears young and constantly; fruit resembles the Routier in shape, only about two-thirds as large, with a blush on the side exposed to the sun; free at the pit; flesh, a shade lighter. It is the first variety that comes in of any consequence among us. I regard it to be good for drying, and canners took it last year with others and did not demur. There is one thing against it—its lack of sweetness that the Moorpark and Royal have.

Another variety is a vigorous and upright grower, will grow very thick in the top, if al-

lowed to; leaf round (2½ inches in diameter), very dark green; fruit ripens same time as the Routier, and is one-third larger than any Royal I ever saw; blush on side exposed to sun; if not exposed a cream-colored flesh the same (creamy).

Another kind has nearly the same description as regards fruit, only a little larger, but the tree is the reverse in habit. It grows scattering limber twigs, has a tendency to shoot branches horizontally from every side; leaf pointed, and is inclined to partly close up; is also dark green.

The last two varieties described ripen the same time but do not bear young. They do not amount to much before they are five years old, but after that bear regularly as far as we know. Trees over that age have done so with us.

Prunes, as far as I can ascertain, are a good crop, and one gentleman told me he sold his last year's crop for 10 cents per pound, and had been off-red the same for this.

The grape looks exceedingly well, there having been no late frosts to interfere, and the warm weather we have had has caused the vine to do its best by way of foliage and bloom. Taken altogether, the prospects for this year's harvest are good, equal to, if not above, an average.

J. R. SPRINGER.

Woodland, Cal.

West Side Notes.

EDITORS PRESS:—Writing agricultural notes from the West Side, especially if one ventures into the realm of prediction, I have concluded is very unsatisfactory.

Two characters could easily be sustained while honestly describing things as seen at time of writing. For instance, there has been a heavy rain, and under the influence of a warm sun the grain comes on rapidly. Every one is confident, and "Hopeful" takes the pen to jot down a few time-worn phrases: "Farmers' faces wreathed in smiles, all nature jubilant, crops now well assured," etc.

But alas! week after week goes by and the hoped-for later rains do not come. The north wind blows unrelentingly, the blades of grain begin to turn yellow, and that strange process called going back also begins. A field that had been covered with a rank, waving growth of grain, a foot or more tall, is soon shrunken to scattered bunches several inches shorter—the wheat really seems to have gone "back into the ground," as they say. The discouraged farmers are remarking: "How like '77 or '87," or some other dry year.

Very likely now "Croaker" takes up the pen to write of gloomy prospects and hard times.

So it goes a constant alternation of hope and fear, until no wonder a young friend who invested here one year (and by the way did very well in the end) said he would not try it again, as he couldn't afford to be scared so often.

Hearing reports from other parts of the State, I am convinced the west side compares more favorably than usual. Farmers are now cutting hay, of which there will be considerable of excellent quality, and some grain will be thrashed. Coming after the complete failure of last year, farmers will feel somewhat pinched, but we have reason to be thankful it is no worse, and all are hopeful for next season.

We have here an annual demonstration of the benefits of winter irrigation, as Corral Hollow creek, spreading out on the plains in ever-shifting channels, always yields several hundred acres of good grain even in dry years, but the few attempts to control it have not met with much success so far, its great fall causing it to rush with such force after heavy rains that costly works would be needed to restrain it.

For the sake of pasture for our stock we have been spending the spring months at our long deserted Corral Hollow farm, in the shadow of the foothills, six miles from Tracy. Here we were forced to see a roaring torrent of water rushing through in its well-worn channel, powerless to apply it to the thirsty land. Rich soil, fine climate, grand and extensive views—the single drawback lack of water. Now in May the gravelly creek-bed has long been dry; even the well on the lower flat has but a few inches of water, and the stock must be driven a mile or more to water.

After reading in the RURAL PRESS some time ago of rivers whose waters ran beneath, while the sand and stones were on the surface, a pick was applied in several places, but the water was not there. We feel financially unable to sink a well this year. Judging from wells in the region, it would require a depth of 150 to 200 feet; and for such a well, all complete, we would gladly deed 40 acres of land. Who wants a chance for a home in one of the finest climates, etc.?

Some time ago, while out star-gazing, I was much puzzled to notice a long line of brilliant lights along the northeastern horizon. I puzzled in vain. They did not look in the least like tulle fires, and even my slender stock of astronomical knowledge refused to believe there was so magnificent a constellation in the sky. Later we learned they were the electric lights of Stockton, some 25 miles away. How the world moves on while we rest in this quiet place! I have always regarded the

Dehorning of Cattle

As a cruel and generally unnecessary practice. Reading lately of great mortality and suffering among recently dehorned stock in Illinois, I

hoped it would discourage the practice. If we must have hornless stock, why not try the milder plan of burning when young? A calf whose horns, soon after their first appearance, were so slightly burned as apparently to cause no pain, has now, at a year old, mere knobs that hardly show where the horns should be, and doubtless, if desirable, a little deeper burning would have been more thorough.

Tracy, May 13th.

Mrs. J. M. K.

THE STOCK YARD.

The Low Hall Shorthorns.

We find in the London *Live-Stock Journal* an account of the Low Hall Shorthorns, which is of general interest for its historical and practical data, and of particular interest because it describes the upbuilding of the herd by the late R. W. Ashburner, father of Robert Ashburner of Baden Farm, San Mateo county, as well as of his brother, the present owner of the Low Hall herd. We quote from the *Stock Journal* as follows:

The Low Hall Shorthorn herd, principally composed of Bates Shorthorns, must ever be closely identified with the introduction of the breed into the northern counties of England, and, by parity of reasoning, also with that of the improved breeds of sheep—Leicesters, Shropshires and Hampshires—for the one followed the successful acclimation of the other. Shorthorn cattle, Leicester and Shropshire sheep, with their crosses, are now found on every farm in these counties, and on several the Hampshire sheep are becoming favorites as giving a greater proportion of lean meat in the lambs. The work of introduction had for one of its pioneers the late Mr. R. W. Ashburner, the father of Mr. George Ashburner, the owner of the present Low Hall herd. From the year 1830 to 1835 the father of the present tenant of Low Hall (which is one of the numerous farms of the Duke of Devonshire), and the late Mr. Cranke of Hawkfield, near Ulverston, each introduced a few Shorthorns on their farms. The latter farm enjoys a much more suitable situation, the farm at Low Hall being partly on the slope of Kirkby Moor, which rises to an elevation of, we should say, about 1000 feet above sea level. A portion of the inclosed land is on the side of the hill; the house and buildings and other portions of the land at the bottom. It is situated not far from the estuary of the Duddon, and the air, combining the sea and mountain, will no doubt be healthy. There are 250 acres of inclosed land, 70 acres high-lying, and 204 acres of inclosed moorland, of which latter the tenant of recent years has made considerable improvement. These latter are devoted to Herdwick sheep. Here, on the somewhat unpromising site, the late Mr. Ashburner began to build up a herd, and the Roughmold herd of Mr. Caddy was, we believe, contemporaneous. From these sources may be said to have sprung all the herds of the district except that of Holker. The Hawkfield herd did not make rapid progress, no record being kept of the pedigree; but Mr. Ashburner, having once resolved on his course, did not allow the grass to grow under his feet. His neighbors characterized the plan as Utopian, and freely prophesied that it would never succeed. There is nothing, however, succeeds so well as success, and by degrees they began to avail themselves of his stock. Lady, the dam of Favourite 3772 (a portrait of which latter hangs in the hall at Low Hall, and which, if we are to believe the artist, must have been a phenomenal bull), was Mr. Ashburner's original purchase from Mr. Hodgkin of Drigg, Cumberland, for a sum under £20. The first entry in the late Mr. Ashburner's herd-book is Favourite, from Lady, by Young Western Comet 1575. There are still descendants at Low Hall, but perhaps the most distinguished was Duchess of Kirkby, by Grand Duke 10th 21,849. She was a beautiful roan, a good breeder, a heavy milker, and her symmetry of form was such that she won her owner upward of 100 prizes at royal, county, and local shows, retaining her form until advanced years. Shortly after the purchase of Lady, Fairy was added from the same place, and at about a similar price, a daughter of Mr. Booth's Bloom, by Pilot 496. Jasmine was next added to the herd for 25 gs., a high price half a century ago. From Lady's descendants Messrs. Gaitkell, in the year 1840, founded the Hall Sinton herd, in the purchase of Cherry from Low Hall, a daughter of Punch 4849, and from her were descended some of the best stock in the Hall Sinton herd. In 1860 Mr. R. W. Ashburner caused a commotion in the district by the sale of a selection from his herd, and when the animals went at prices varying from 20 gr. upward, a strong stimulus was given to Shorthorn breeding in the northern counties. The herd has kept pace with the times, and in the hands of the present owner it has not only done much to provide the farmers of the neighboring counties with improving sires, but animals from it have gone all over the United Kingdom and abroad, and are still regularly going, for Mr. Ashburner is a regular exhibitor in the prize rings, and doubtless he finds such a course proves a good advertisement for the herd. He still goes largely to the old strains for his prize animals, and as the exhibiting does not appear to affect the breeding, we suppose there must be good constitution underlying, and that

this hardy constitution has not been affected by the succession of sires from fashionable families is likewise no less a tribute to the latter.

The treatment of the cattle at Low Hall is of a natural kind. They are bred with excellent coats of hair, essential in a district so elevated in some of its pasture land. With the exception of the youngest calves and the bulls (the bulls are not allowed to run out in the district), we found, at the end of October, all the cattle in the fields. In the high-lying pastures were the dry cows, keeping up condition in their elevated lookout; descending the hill, we found the in-calf heifers, and so on, in rotation, until in a snug paddock close to the house we found the successful show animals of last year. In the lower lands were the milch stock, and this is essentially a milking herd of Short horns, some of the recently calved cows milking up to 12 quarts. A proportion of the milk is fed to calves, and the remainder made into butter. About 50 acres is annually under the plow, oats, swedes, mangolds, potatoes, carrots, etc., being grown, and this year Mr. Ashburner had been very successful in getting a catch-crop of three acres of a mixture of wheat, rape and mustard sown after the oats were harvested, and on which he was fattening sheep at the time of our visit. The season had been an exceptional one, and it is the first crop of the kind that we have ever known in the district. The remainder of the farm is in grass, pasture and hay meadows. There are about 70 animals in the herd—we say about, for it is difficult to speak definitely of the herd where the animals are ever coming and going. A few young cross-bred animals are annually brought in to fat, and the sheep flock varies from 200 to 300 in lambing time. Some 14 to 20 Shropshire ewes are kept, the remainder are Herdwicks and their crosses—half and three parts bred sheep, to suit the different altitudes of the farm. There are eight horses on the farm, five of which are classed as work horses, two mares being of Clydesdale type and one Shire mare; a remarkably fine action cob, clever either for driving or riding, and two young animals. The horses are all of a capital type, strong and active. Mr. Ashburner is his own farm bailiff, and everything on the farm—horses, cattle, sheep, pigs, turkeys, geese, ducks, poultry, no less than the cleanliness and excellent crops on the land—betoken excellent judgment and the constant supervision of the master mind. The farm, as well as the animals, has frequently been successful at royal, county and local exhibitions; the sideboard is well stocked with prize plate, and the prize cards, won in the course of half a century's regular competition, would go far to paper the walls of Low Hall. The herd consists of several families, Mr. Ashburner having paid liberal prices for the original animals of such, and afterward using bulls of excellent pedigree from the Holker and other first-class herds.

THE VINEYARD.

Brush Mulching of Vines.

EDITORS PRESS:—I have had some experience in successfully making grapevines grow in this dry, warm foothill climate without irrigation, and I believe that my method of taking care of them may, if known, be a benefit to others who are similarly situated. I was told by all the old settlers around here that vines could not be started without water, and that my efforts to do so would be a foolish waste of time and money. I had seen it done in other localities and stubbornly persevered to accomplish the same thing at this place. I am rewarded for my persistency in seeing fine two-year-old vines growing luxuriantly and coming into bearing in a small way the present year. When I first planted the cuttings I was very much troubled with the rabbit pest, and had recourse to a rabbit-proof fence which I began building soon after planting, but the hungry, long-eared thieves began cropping off the young foliage of the vines before my fence was completed, and I was at a loss to know what to do. In order to save the vines in the outside rows which were most exposed, I concluded to place a covering of brush over them for a protection. I did so, and the experiment opened to me an idea which I have since acted upon with uniform success. In a short time after covering, as described, a remarkably hot wave passed over the land and cooked quite a per cent of my uncovered vines, while those covered stood the heated term bravely and came out green and vigorous. I thus, by an accident, as it were, made the discovery of the great benefit of brush mulching, and coming into that knowledge by a haphazard venture which resulted favorably, I persevered in the method of lightly covering them with brush to mollify to a certain extent the burning rays of a summer sun. I covered my small vineyard with the brush mulching and found that those which had appeared to be cooked renewed their growth with vigor. In treating my vines in this manner, I saved a large per cent of them and did the same thing last year with the same good results.

It is much trouble to do this mulching, and it makes a place look ungainly; but if tried, I am quite sure the labor and patience will be rewarded with success.

The benefits of mulching I quite well understood before this trial, but I had only seen straw used for the purpose, and as no straw could be obtained, and as there was a bountiful

supply of brush near by, I made use of what nature had placed within reach. The brush breaks the direct rays of the sun and keeps within a portion of the winter's moisture. All who have observed closely the workings of nature will call to mind how luxuriantly grass will grow underneath a dead brush lying in a field or wood. Brush mulching need have no stronger argument in its favor than this one fact, patent to all thinkers. In operating on this plan the brush should be placed lightly around the vines during the month of May. Sooner or later, as the season may be more or less favorable, the finer the quality of the brush the better the material will be for the purpose.

The season of the year is now at hand when the struggle for life begins with the young vines, and for those persons situated away from irrigating facilities, I would say by all means try this method and you will not have cause to regret it. I do not wish to be understood as affirming that vines can be saved by this plan alone. Thorough and persistent cultivation is necessary, and by putting your soil in proper tilth the brush mulching will be an auxiliary which will carry it through the long dry period of a California summer and fall.

Valley Spring, Calaveras Co.

Vine Pests and Diseases.

The following are recommendations by the Chief Executive Officer of the Board of State Viticultural Commissioners for the destruction of animal and vegetable parasites of the vine, being a resume of rules and remedies adapted to the present season:

The present being the season of greatest activity in the operations of combating vineyard pests and diseases, many of which appear so suddenly in some of our vineyards as to leave no time for the proprietor to waste in looking up the results of former experiments or remedies described in some lost paper or publication, it has seemed a fitting time to publish a brief abstract or summary of the principal enemies abroad at the present moment, together with the best known means of destroying them.

Cut Worms

May, if few in number, be found at night with the aid of a lantern when they are preying on the leaves or young shoots. Another method is to dig them out of their hiding-places near the roots of the infested plant in the daytime, as they retreat with the appearance of daylight to just below the surface of the ground. If in sufficient numbers to warrant, spray the vine with a solution of Paris green (which must be agitated continuously while using to prevent settling) 1 pound to 150 gallons of water. This will not harm the fruit or plant, even though the grapes have attained half the size of a pea. If it is feared that live-stock may get to the foliage and thereby become poisoned, apply the same solution to cabbage leaves, which, if placed near the troubled vines, will attract the cut worms and destroy them. Afterward the cabbage leaves may be picked up and destroyed or left to wither without danger.

To apply the Paris green solution, use any good spray pump, or even a syringe will answer for operations on a small scale.

Sphinx Moth Worm,

(Or army worm, as sometimes improperly called) spray with Paris green as above, using 1 pound to 150 gallons of water. Treat particularly well the outside rows of the vineyard and they will never get farther than these. If only a few infest the vines they may be hunted on the foliage and destroyed by hand.

Grasshoppers.

This plague has been successfully met by the use of arsenic and bran remedy prepared as follows:

Forty pounds of bran, 15 pounds middlings, 2 gallons of cheap syrup, 20 pounds arsenic, mixed soft with water; a tablespoonful thrown by the side of each vine or tree. Cost per acre for trees, 25 cents; for vines, 50 cents. If placed on shingles about the vineyard, much of the poison not eaten may be afterward gathered up and saved. Complete success has resulted from the use of this remedy, as the grasshoppers eat it readily and die in their tracks. For this remedy may be substituted with equal effect the Paris green spray applied as for cut worms.

Thrips

Are best trapped by means of two semi-cylinders framed with band iron and covered with window gauze; these hinged together on one side should be provided each with a semi-circular pan for a bottom so arranged that the whole may be closed about the vine. Rub the gauze over with a rag saturated with coal oil and place a little also in the pan at the bottom. Then, when the whole is closed about the vine, kick the stump of the vine, or disturb the foliage by introducing the hand or a stick from the top, and the insects fly to the gauze, where contact with the oil destroys them. For full particulars regarding the construction of and method of operating this trap, see Second Appendix to Report of Chief Executive Officer for 1888, or RURAL PRESS, April 21st and 28th. Thrips cannot be poisoned on the vine, as they subsist on the sap alone which is sucked from the leaves, thus causing them to wither and dry up.

The Flea Beetle

And others of this class which consume the foliage of the plant, giving to the leaves a rid-

dled appearance, may be trapped also with the above-named contrivance, for commonly, any slight disturbance causes them to drop to the ground, where they secrete themselves. A better method, however, where circumstances will permit, is to spray the vines with the Paris green solution described above.

The False Chinch Bug

Is of a grayish-brown color with pupa of about the same color; both are, when fully grown, about one-eighth of an inch in length. They appear occasionally in spots in the vineyard infesting such vines in great numbers and consuming the leaves. They fall to the ground when the vine is disturbed where they are scarcely visible. They have caused our vineyardists no serious damage, as they disappear after a short season and have not at any time in the past become general. They may be easily caught with the gauze trap and coal oil, or may be poisoned by the Paris green spray.

Hares, Rabbits and Squirrels

Have been a constant menace to young plantations made in new districts. A tight fence affords the most perfect immunity from their attacks. Squirrels may be kept out by making a tight fence along the side of their approach, for they will not travel far to go around this unless the place is very much isolated, because of their fear of dogs, hawks and other natural enemies.

Hares, which come a long distance to devour the vines, will be noticed to confine their attacks to a few vines at different places in the vineyard which they eat down as regularly as the new growth appears. A weak solution of asafetida prepared by dissolving in alcohol and then adding water, has been applied to the afflicted vines with good success. These animals will also be destroyed by the Paris green solution if applied frequently during the early growing season.

Vegetable Parasites — Oidium (Powdery Mildew)

May be best prevented or removed by using sulphur, which should be applied first when the vine is in full bloom, being careful to dust or blow it well over the flowers. Repeat the dose about the middle of June and later again if any sign of the disease appears. If for table grapes, the sulphuring may be continued monthly till they begin to change color. Sulphuring should, however, never be done to wine grapes after the berry has attained two-thirds its full growth, as by so doing it reaches the wine and gives it a bad odor. Let it be remembered that the disease begins its development where the average of day and night runs up to 53° F. It spreads rapidly at 70°, and is checked in its growth where the thermometer indicates near 100° F. Above 100° its damage is rapidly diminished, and at 112°, a temperature quite common throughout the interior vineyard districts of California, the germs lose their vitality and the effects of the disease entirely cease.

The sulphur used may be either finely ground or sublimed. The former is most commonly employed, as it is cheaper and answers the purpose equally well. It should be applied so as to lodge as much as possible on and near the growing parts of the vine. This secures a dense sulphur vapor in direct contact with the diseased organs. Sulphur on the old stump, or even on the surface of the ground, will destroy the oidium, but a larger quantity would be required.

Coulure.

Though not in itself a direct disease, results from other evils. It is in a measure prevented by sulphuring at the time of blossoming, when oidium, which would otherwise interfere with the fertilization of the flower, is removed. This is not always a cure, however, as other causes exist for the evil, principally sudden changes in weather, either hot and dry or cool.

The most successful treatment for the trouble, when so occasioned, results in *pinching*, the process of pinching off the ends of the fruit-bearing shoots when flowering begins. Also the annular incision may be adopted, which consists in ringing out with an appropriate tool, a band of the outer bark on the fruit-bearing cane or shoot just below the point where the bunch stem joins the shoot. Nipping off the end of the long bunches will also aid in keeping the remaining fruit on, and cause it to ripen large and fine.

The foregoing disposes of those enemies most common to our vineyards in the past, with the exception of the phylloxera, which, though most formidable of all, has been discussed on at sufficient length before.

J. H. WHEELER,
Chief Executive Viticultural Officer.

CASTOR-OIL AS A LUBRICANT.—A correspondent of the *English Mechanic* writes as follows in a recent issue: "The Asiatic wire-drawers have very long ago used this oil in preference to any other kind. Their dexterity is surprising, the wire for the Trichinopoly chains of gold and silver being like hair, and every good workman draws his own. A man made me a plate for the fine gauges from a flat rasp of English steel, which I still possess. He drew copper, zinc and brass equally well. This oil, being one of the cheapest in India, is used to soften harsh leather shoes and ropes. The fresh leaves of the castor-oil tree, too, are gathered, bruised and rubbed in the hand, then stuffed tightly into stiff European boots, male or female, and so remain all night; the leather then becomes quite supple. For feeding large drills I like this oil mixed with a soft soap."

SHEEP AND WOOL.

The Wool Industry.

We are on the eve of another wool season, and naturally the probable character of the market becomes important not only to growers, but also to manufacturers and dealers in woolen products. The statistical situation of wool the world over favors high prices, but then the sentiment is against a higher range of values; and as the latter has been instilled into bull operators by bitter experiences, statistics go to the wall and sentiment controls. But then wool is not the only article of production that time has cheapened, for, without an exception, everything from the metals, everything dug from the bowels of the earth to the products of the soil, is selling throughout the world at a very much lower range of values than obtained from one to two decades ago. View it in any light we may, discuss it from any standpoint chosen, and still the conviction is forced upon the unbiased close observer of passing events in the commercial world that the changed relations have been brought about by the more general introduction of steam on land and on water in transporting goods at lower rates. The cheapening of the telegraphic service, with lines reaching out in all directions and into every civilized country, and last, though by no means least, the absence of war, has tended to make production outrun destruction. With cheaper, quicker and better telegraphic and also transportation service, time and distance are annihilated and the successful forming of corners are rather costly experiments for the promoters, consequently trade is left more to its own bent; and, being without proper support, prices naturally tend to lower values until they correct themselves by consumption outgrowing production. This remedy the near future holds out for the wool trade. The population of the world is estimated at 1,392,000,000. Of these it is safe to claim that not much more than one-third are important consumers of wool. To arrive at a satisfactory conclusion regarding the future of the industry it is necessary to obtain from the most reliable sources the production of wool and its consumption. According to the United States Bureau of Statistics, the production is as follows in its raw state and after cleaning:

	Raw, lbs.
Europe.....	584,000,000
Asia (India and Caucasus).....	100,000,000
Africa.....	75,000,000
North America.....	346,000,000
South America (excluding Brazil).....	340,000,000
Australia.....	430,000,000
Total.....	1,875,000,000
	Clean, lbs.
Europe.....	400,000,000
Asia (India and Caucasus).....	50,000,000
Africa.....	45,000,000
North America.....	168,000,000
South America (excluding Brazil).....	120,000,000
Australia.....	220,000,000
Total.....	1,003,000,000

By the above table it will be seen that the loss in weight by cleaning is very large in Asia and North and South America, which necessarily shows that there is something radically wrong in the sheep husbandry in those particular sections of the globe. South America does not manufacture woolen goods, so the only consumers of wool for manufacturing purposes are the United Kingdom, the continent and North America. The Messrs. Schwartz, who are a recognized authority, place the production and imports of the three great consuming (manufacturing) areas as follows:

	Production, lbs.	Imports, lbs.	Total, lbs.
In 1887.			
United Kingdom.....	134,000,000		
Continent.....	450,000,000		
North America.....	346,000,000		
Total.....	930,000,000		
In 1887.			
United Kingdom.....	258,000,000	392,000,000	
Continent.....	580,000,000	1,030,000,000	
North America.....	104,000,000	450,000,000	
Totals.....	942,000,000	1,872,000,000	

According to population, the United Kingdom is the largest consumer of wools, using over 300 per cent more than North America and about 50 per cent more than the continent. Germany is the largest consumer on the continent, owing to wools coming in free of duty. To obtain a better and more distinct impression of the situation, we give the following statistics for ten years past:

Yrs.	Population.	Consumption, lbs.	Per head, lbs.
1878.....	357,000,000	1,514,000,000	4.25
1879.....	361,000,000	1,522,000,000	4.22
1880.....	366,000,000	1,633,000,000	4.46
1881.....	370,000,000	1,627,000,000	4.40
1882.....	374,000,000	1,711,000,000	4.58
1883.....	378,000,000	1,727,000,000	4.57
1884.....	383,000,000	1,820,000,000	4.75
1885.....	387,000,000	1,830,000,000	4.73
1886.....	391,000,000	1,911,000,000	4.89
1887.....	395,000,000	1,872,000,000	4.74

As will be seen by the above, the consumption per head has not only increased, but there is an increase in the number of consumers. Judging the future by the past, it can be confidently asserted, even without wars, that within the near future the consumption of wool will be in excess of the production, when a much higher range of values will follow,—
S. F. Herald of Trade.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

True Patriotism.

Following is the address delivered by Bro. J. W. Mackie at Tulare County Grange picnic, May 9th:

"Dulce et decorum est pro patria mori."

So sang the Roman poet. It is sweet and glorious to die for one's country, and so sings every true American. Yet sweeter far and better still it is to live for one's country, to live exemplifying the spirit of those principles underlying its institutions and history which makes the country of our birth worthy of our best life and most heroic death.

We are patriots when we identify ourselves with our country, when its interests are our interests, our private interests being always subservient to the common weal of all.

I am addressing Americans in the most favored State in the Union:

"Land of the West—beneath the heaven
There's not a fairer, lovelier clime;
No one to which was ever given
A destiny more high, sublime."

But my accent prevents the possibility of my concealing the fact that my native land is Scotland, and I would not conceal it if I could. And like all of my countrymen, I have an inordinate pride in my native land. If there exists the monstrosity—a Scot ashamed of his country—it will be a fellow unworthy of Scotland, unworthy of any country, and peculiarly unworthy of America.

I repeat, I am proud of Scotland.

"O Scotia! my dear, my native soil!
For whom my warmest wish to heaven is sent,
Long may thy hardy sons of rustic toil
Be blessed with health, and peace and sweet content."

But I am addressing Americans, and though I know that Scotland stands high in American esteem, yet it is not of Scotland nor Scottish patriotism that you expect to listen to, nor what the Grange desired when they selected "True Patriotism" as the subject of this essay, and your humble servant to prepare it. What purpose did the Grange have in selecting a Scot instead of a native son of the Golden West?

From Bruce to Burns, from Wallace to Scott, is there anything in Scottish history, in Scottish struggles for independence, that can suggest a reason? In her long list of heroes and martyrs to the principles of civil and religious liberty is it to be found? From Knox—Knox! Ah, here let us linger a moment, for with the name of Knox there comes the echo of a reason justifying the wisdom of the Grange. Knox and the school of Geneva; had they never existed, Presbyterianism and Puritanism would never have been known, consequently there would have been no historic Mayflower, nor Plymouth Rock, nor Pilgrim Fathers, and—the very supposition makes me sad—there never would have existed that most glorious document ever penned by man, that inspired instrument, the Declaration of Independence; and sadder yet to suppose, there never would have existed that nation, in spite of all its shortcomings, the greatest, grandest, most devoted to freedom and the best interests of mankind the world has ever seen, the United States of America.

So I interpret the action of the Grange to mean a complimentary acknowledgment of America's indebtedness to the Calvinism of the sixteenth and seventeenth centuries for her existence as a land of the brave and a home of the free.

There is much in the history of Presbyterianism and Puritanism that is inconsistent with our more modern ideas of individual and national liberty. We are apt to condemn them for the harsh lines which they drew around individual conduct, and laugh at their blue laws; but let us never forget that Presbyterianism taught the Scotch Covenanters, who had inherited a spirit of defiance to English interference in their government, to add to it a more determined defiance of not only England, but also Rome and the whole world, if need be, in the maintenance of the right to worship God and govern themselves as their consciences dictated. The same spirit, springing from the same source, animated the Puritans of England, and was carried over and landed at Plymouth Rock in the Mayflower. And of such were the Revolutionary Fathers. But the acknowledgment of indebtedness reaches even farther than this. In the Presbyterian and Puritan churches representative government was introduced and the vote of a congregation or a synod became a higher authority than the word of a

king, or even the legal enactments of Parliament. So it came to pass that Puritan education in Massachusetts tended to breed contempt for a king and a respect for the will of the people. There is much that is human and imperfect, much that is worthy of condemnation, in Puritan history, but let us forget all these necessary evils in the greater good they have so nobly and bravely bequeathed to us.

But the Grange has gone still further by her selection to-day. By it she has declared to the world that the patriotism she inculcates knows no geographical lines. The patriotism of the Grange means those eternal principles of liberty, justice and truth which only are worthy of preservation and which alone entitle a nation to respect; to that devotion of life and property which is incumbent upon every true patriot. So the Grange hails with delight, extends her sympathetic hands and welcomes as compatriots every defender of these eternal principles which we are proud to call American, wherever they may be found. And every innovator, every sacrilegious hand that would dare limit the meaning of the spirit of American institutions, that would lower the dignity of the people, is, in the eyes of the Grange, a traitor and an enemy, no matter what his position or in what clime he may live.

So I to-day, as a Granger, as a citizen of the United States of America, with the stars and stripes wrapped around my heart and floating over my head, see only in my adopted country a greater Scotland, a larger development of all that I hold dear and all that I love in my native land. And I further interpret the action of the Grange to mean a whole-souled invitation to every man and every woman of every country who have in them the spirit of American institutions, to make their home in this land and be assured of a hearty welcome.

This brings me face to face with a subject which at present is agitating the people of the United States of every shade of political opinion, namely: foreign immigration. I do not believe that there exists to-day a true American who objects to foreign immigration on the basis of antipathy to foreigners, as such. But America is justified in objecting to criminals, paupers and imbeciles of foreign lands becoming a part of her population, becoming a tax on industry and a hindrance to progress, to intellectual and moral advancement. I, much as I love Scotland, and because I love Scotland, desire no countryman who is not a representative Scotchman to be ever seen in America. The United States has no more use for European or Asiatic crime or imbecility than the Colonies had for British tea in 1773 or British and Hessian soldiers in 1776.

If Europe has more crime, pauperism and imbecility than it can manage well, let Europe adopt proper means to avoid producing such undesirable conditions. At any rate, the United States has a surplus of her own, has no use for the imported article, and is busy, with the help of the Grange, doing all she can to do away with home-made poverty and crime, and will do more as her knowledge widens and the influence of the Grange becomes more extended.

As a foreign-born citizen, permit me a few words on citizenship. I have always thought American citizenship altogether too cheap. It is not a mark of merit. It signifies neither intelligence nor morality, it is only a question of vitality. Anything of the male persuasion landing in the United States and able to live five years can become a citizen; any male born here who manages to live 21 years is a citizen. Both parties, in my estimation, should prove themselves men worthy of the founders of this republic before being intrusted with a voice in its government. And then, think of it, you exclude your mothers, wives, sisters and sweethearts, who have so bravely and so often proved their patriotism in perilous times, from this precious boon of the ballot, and actually throw it away on the worthless. The women of America should become revolutionists in this matter, and demand their God-given right of which they are deprived by their protectors (?).

One word to Young America: Esteem the stars and stripes as the most precious legacy ever bequeathed "from bleeding sire to son." Love the old flag, cherish it, defend it, and be always worthy of it. Let its emblematic colors, with their meaning, sink deep into your heart, the red, the white and the blue. The red signifying love; the white, purity; and the blue, truth. Love, purity and truth, which you love and defend when you love and defend your country's flag. Let no enemy at home or abroad touch a single star or stripe; hold it inviolate as you have received it, and never permit it to be used as a cover for wrong-doing. So shall your flag, that grand old flag, be respected abroad and loved and revered at home.

The Grangers' Bank

The refitting and enlargement of the Grangers' bank in this city, to which we alluded in the *RURAL* of March 31st, have been completed, and the institution is now going forward with its business with greatly improved facilities. The change gives the bank twice the room it has had hitherto, and this includes a second vault, an exact duplicate of the original one. Doubling the floor-space gives plenty of room behind the counters for needed desks, etc.; it gives the public another entrance to the bank and abundant space outside the rails; it gives the manager a good-sized room, which has long been seriously needed, and it also affords a large room for storage of samples, papers, etc. To one familiar with the old accommodations, and seeing the new, it is a wonder how the enlargement could have been postponed till now.

The new counter-guards and screens are as handsome as anything we have seen of the kind. The framework is of walnut, well polished, ornamented with brackets of burnished brass in scrollwork, etc., the whole producing a most agreeable effect upon the observer, either when viewed in detail or in perspective. The design is very beautiful and appropriate.

The Grangers' bank of San Francisco has just passed its 14th birthday, as it was incorporated in April, 1874. At the opening of the institution the directors secured the services of A. Montpelier, who had been for ten years previously teller and cashier at A. Borel's Swiss-American bank. Mr. Montpelier's experience and financial talent were a great acquisition to the new banking institution. He served the first year as receiving teller, the following two years as cashier and teller, and in 1878, just a decade ago, he became cashier and manager, which position he has held ever since with manifest success. His services in building up a better estimation of agricultural security, and of making money accessible to farmers at more favorable rates than they have had before, and in promoting the interests of the institution intrusted to him, have all been frequently mentioned in our columns. His 24 years of experience in banking business in San Francisco are enthusiastically devoted to the important work he has in hand.

In his management of the bank Mr. Montpelier has had the advantage of good assistants who have conscientiously carried out his system. Mr. Frank McMullen has been secretary and teller ever since December, 1875, Mr. George Fair has been head bookkeeper since 1878, and the assistant bookkeepers, corresponding clerks, etc., have also held their places for several years. It seems fitting to mention these things as the enlargement of the bank gives occasion.

The following circular has just been issued and contains many interesting statements:

The bank was organized in April, 1874, and has been doing a legitimate, conservative and prosperous business ever since.

Its subscribed capital is.....	\$1,000,000
Its capital paid up (six installments levied).....	600,000
Its reserve fund and paid-up stock.....	58,840
Dividends paid to its shareholders since organization.....	525,000

Its stockholders, over 300 in number, are well-to-do farmers from all sections of the State and capitalists of this city and elsewhere, whose combined wealth the assessors' books will show to be over fifteen million (\$15,000,000) dollars. This ought to be ample guarantee to the depositors and patrons of the bank for their safety.

Our line of current accounts is now quite large, including farmers, wool-growers, wine and fruit-growers, country merchants, produce and commission-houses, grain-dealers in the city and country, merchants generally, corporations, the Produce Exchange Call Board depositors and others.

You are cordially invited to visit our newly enlarged office, which is centrally located, and we confidently expect to add soon quite a number of customers to our present ones, and will be pleased to serve the interest of all as heretofore. Yours faithfully,
ALBERT MONTEPIER, Manager.

The location of the Grangers' bank is on the corner of California and Battery streets, and is worth a visit from those who come to view our city and its institutions.

Temescal Grange and Harvest Feast.

Brother J. V. Webster being present on Saturday evening, May 5th, was an extra occasion for this Grange. Although living at Creston, San Luis Obispo county, with his wife, son and daughter, they are all good members still of Temescal. He has always proved one of its true and faithful charter members from its organization in June, 1873. Having served as Master and Secretary of the State Grange and worked long and prominently in all our leading Grange movements, his counseling and advice is looked to with favor and confidence. Any Grange may expect a good meeting when Brother Webster participates, and Temescal had a profitable and interesting evening.

Brother Webster was in excellent spirits and delivered one of his best speeches, the subject for discussion being Taxation.

Worthy Master Goodenough, who, by the way, is making an excellent presiding officer of Temescal Grange, and other brothers and sisters, followed Brother Webster with well-timed remarks.

The next meeting of Temescal Grange occurs on Saturday, May 19th, at 10 o'clock

A. M., when the Fourth Degree will be conferred upon two young men, and a Harvest Feast will be given. It was voted to invite Eden Grange and all Patrons in good standing. It is hoped there will be a full meeting and many present from Haywards, Contra Costa county, and other parts of our Grange field.

Tulare Grange Picnic.

EDITORS PRESS:—I inclose copy of my little effort at the picnic on the 9th. I presume the *Tulare Register* is on your list of exchanges, and you will there find an account of what took place better than I can now give. I can only say at present that the day was very enjoyable. The presence of Bros. Overhiser and Flint was a most agreeable surprise. We made the acquaintance of Lucerne Grange, and there is a great probability that we will pay them a visit in the near future. I am sorry to say that I did not see any brothers or sisters from Buena Vista Grange. Yours fraternally,
J. W. MACKIE.

List of Grange Picnics.

Magnolia and Grass Valley, at Indian Springs, May 25
Bennett Valley Grange, May 26
Sacramento County Granges, at Beach's Grove, May 22
Watsonville Grange, at Porter's Grove, May 26
Secretaries are requested to send in dates of picnics yet to be held as soon as possible.

GRANGE SOCIAL.—Valley Grange will give another of its pleasant socials on Friday evening, May 25th, at Pacheco. Good music has been engaged for the occasion. These socials are largely attended, and are the source of great enjoyment to the participants.

MARCH GRANGE is to have a reunion on the 26th inst., at which time Bro. Pilkington of Santa Cruz is expected to be present. A Harvest Feast will be one of the features of the day.

BRO. DANIEL FLINT, W. L. of the State Grange, will attend Grass Valley Grange picnic on the 26th. Grass Valley will have a right royal good time as well as the W. L.

Great Railway Consolidation.

It is announced from Sacramento that a grand consolidation of all the railroads of the Southern Pacific system has just been effected, and the company thus formed will be henceforth known as the Southern Pacific Railroad Co. Its articles of incorporation were filed in the Secretary of State's office this week, and under the new regime, will embrace the following companies: The San Jose & Alameda Railroad Co., the Pajaro & Santa Cruz Railroad Co., the Monterey Railroad Co., the Monterey Extension Railroad Co., the Southern Pacific Branch Railroad Co., the San Pablo & Tulare Railroad Co., the San Pablo & Tulare Extension Railroad Co., the San Ramon Valley Railroad Co., the Stockton & Copperopolis Railroad Co., the Stockton & Tulare Railroad Co., the San Joaquin Valley & Yosemite Railroad Co., the Los Angeles and San Diego Railroad Co., the Los Angeles & Independence Railroad Co., the Long Beach, Whittier & Los Angeles County Railroad Co., the Long Beach Railroad Co., the Southern Pacific Railroad Extension Co., and the Ramona & San Bernardino Railroad Co. The capital stock of this immense system is \$142,990,000, and the following are its directors: Charles F. Crocker, Timothy Hopkins, Charles Mayo, W. V. Huntington, N. T. Smith, J. L. Willcott and A. N. Towne.

Another Consolidation.

Articles of incorporation have been filed in the office of the Secretary of State of another great railroad corporation. It is entitled, Association, Incorporation, Amalgamation and Consolidation of the Northern Railway Company, the Winters & Ukiah Railway Company, the Woodland, Capay & Clear Lake Railroad Company, the West Side & Mendocino Railroad Company, the Vaca Valley & Clear Lake Railroad Company, the San Joaquin & Sierra Nevada Railroad Company, the Sacramento & Placerville Railroad Company, the Shingle Springs & Placerville Railroad Company, the Santa Rosa & Carquinez Railroad Company, the Amador Branch Railroad Company and the Berkeley Branch Railroad Company. The name of the corporation is the Northern Railway Company, and the estimated length of the roads is 699.69 miles. The principal place of business is San Francisco. The directors are Leland Stanford, Charles F. Crocker, W. V. Huntington, Timothy Hopkins and N. T. Smith. Capital stock, \$26,175,000, of the par value of \$100 each.

NEBRASKA STATE FAIR.—We have received from R. W. Furnas, secretary of the Nevada State Board of Agriculture, the regulations and premium list for their 22d annual fair, which is to be held on the new and commodious grounds at Lincoln the second week in September. Friday and Saturday, September 7th and 8th, will be preparation days, and the exhibition proper will open Monday morning, the 10th. The State Horticultural Society will make its fall fruit exhibit at the same time and place.

A Harvest Scene in California.

We give herewith a view of a California wheat-field in which there are shown 10 Osborne steel-frame self-binders as they appeared at work last season on the ranch of Mr. A. H. Washburn, owner of the Yosemite stage lines, near Madera, Fresno county, California. Mr. W. adds that of an intelligent and progressive farmer to his various other callings, and after investigation has concluded that the self-binding reaper gives the best results in harvesting his wheat crop. As a result of this conclusion, he operated ten self-binders last year, as the engraving shows.

The best mode of harvesting has always been an interesting question to the farmer; and when we say best, we mean that affording the best and most profitable results, all things considered.

It is an undeniable fact that in the earlier history of the grain export trade of California our wheat stood No. 1 in grade in the English markets. Of late years it has been deteriorating in quality, until now it holds the unenviable position of fifth or sixth quality, and it is claimed

state, thus avoiding the shelling by winds and other causes, and the liability to grain-field fires is lessened, which is no small matter itself.

In years past the extensive grain acreage of many of our farmers made it impossible for them to harvest their crops with the reapers then in use, but since the self-binders have attained such perfection it is claimed this trouble no longer exists, as the same number of men and teams attached to self-binders will harvest more grain than an equal number with headers, as Mr. Washburn and others have demonstrated, and the quantity and quality of grain secured will compensate for any difference in the cost of harvesting. Besides this, the straw left from the bound grain, being cut green, retains moisture and nutriment, making a good quality of stock feed, while the headed straw is comparatively worthless.

Besides this, in some sections of our State the self-binder is being extensively used and growing in favor for cutting hay, and for this purpose has received the indorsement of many leading horsemen, notably Senator L. J. Rose of Los Angeles, E. W. Chapman of Fresno county, W. H. Forse of Ukiah, and many

Possessing their own rolling-mills, the Osborne Co. were first to substitute steel for the clumsy and cumbersome wood frames yet used by most of the other manufacturers. The cast parts being mainly of malleable iron, particularly the binder gearing, road-wheel and other important parts, thus securing lightness with the greatest possible strength. The drive-wheel is made in sections, with very wide face, thereby securing lightness of draft. The entire frame of the machine is made of angle steel, while the finger-bar is made of extra-thick double-angle steel, which cannot sag or warp, thereby always securing easy play for the knife, which has a short pitman, and has a direct connection with the crank-head. The bottom is secured by a steel-protecting plate, riveted to the finger-bar and bottom of platform, which can be raised or lowered at will, leaving a stubble from three inches to two feet, according to the length of straw, or notion of those using binder, thus allowing the shortest or tallest grain to be handled, as the elevators are five feet wide. The binding attachment is automatic, leaving the bundles of uniform size, the whole making one of the most perfect and

The Rose Show.

With unstinted supplies of foliage and blooms, arranged by many tasteful and nimble hands, the ladies interested in the success of the Woman's Exchange had turned the store under the Grand hotel into an embowered flower-garden on the occasion of their rose show the latter half of last week.

While roses were predominant and gave name to the display, other flowers were to be seen in abundance on every side. Near the entrance was a little grove of palms and ferns from the conservatory in Golden Gate park, and in the middle a picturesque group of magnolias, loquats and other exotics from the garden of the famous florist, M. Poyal. John H. Sievers also made an excellent display of rare orchids.

Mrs. Wm. T. Coleman sent a magnificent stand of flowers from her conservatory at San Rafael—Marechal Niel, Bon Silene and La France roses, magnolias, passion-flowers, cinerarias, etc.

Another beautiful stand was furnished by two other San Rafael ladies, Mrs. Lewis Gerstle occupying one side and Mrs. Louis Sloss the other. This output consisted mainly of roses fringed with ferns and crowned with a ridge of maiden-hair in pots.

Dr. Charles Brigham displayed more than 60

THE WHEAT HARVEST IN CALIFORNIA—SCENE ON THE RANCH OF A. H. WASHBURN, FRESNO COUNTY.

that the decline in grade has been in the same ratio as we have substituted heading for reaping and binding grain, thus sacrificing quality and quantity of grain to facility and dispatch in harvesting it. While the mere question of cost per acre was formerly on the side of the header, since the advent and success of the self-binder this is claimed to be no longer the case.

A report made by a committee of the Liverpool Board of Trade some years ago went into this question of harvesting quite fully, and very strongly recommended binding wheat instead of heading it. All practical farmers well know the risks of heading. First, all grain must stand uncut until fully ripe and dry before a header can be started. It is thus exposed to north winds, which shell so much, the birds more than collect their tribute, and the cutting process shells more. It is waste and loss on every hand, and the longer it stands the greater the loss. Besides this, mustard, wild oats and noxious weeds ripen and go to seed, fouling the land, and are difficult to separate in thrashing, thus depreciating the quality of the grain.

Nor is this all. Every miller knows the difference between headed grain and that cut at the proper stage with the self-binder; the former is dark, hard, shriveled and shrunken, and weighs less, making more bran and less flour; while that cut with the binder is a plump and full kernel and weighs more. Many risks are avoided by using binders, as cutting can be done earlier, while the grain is in the dough

others, all of whom use the Osborne binder. The advantages claimed for binding hay are that it dispenses with raking and leaves the hay clean and wholly rid of dirt, sand, grit, clods, etc., which is unavoidable when a mower is used and raked in the old way. which is claimed as injurious, particularly to young horses; the hay tied in bundles cures sweeter and better, without bleaching, retaining all its nutritive qualities, while the bundles are compact and very convenient in hauling, storing and feeding. Add to all this the fact that the twine used for binding costs less per acre than raking and cocking does, and the growing sentiment among our horsemen in favor of binders for cutting hay is easily understood.

The low price of grain for the past few years compels a change from the old careless, wasteful modes of harvesting; and every advantage must be taken by our smaller farmers to reduce expenses, and do as much of this work as possible without extra help. Space will not permit us to treat this topic as fully as we would wish, but it is a matter worthy of attention, and we should like to hear from our grain-growing readers concerning the conclusions they draw from their experience in the use of different methods of harvesting. The machine here-with illustrated is claimed to be the best of its class. Being made almost wholly of steel and malleable iron, it combines great strength with lightness and durability, and is a model of beauty in design and simplicity in mechanism.

complete machines ever invented, and one which is comparatively indestructible.

The "Osborne Steel-frame Self-Binder" is manufactured at Auburn, N. Y., by D. M. Osborne & Co., one of the pioneer houses in this line, whose factories cover upward of 20 acres of ground. Their products are limited in sale only by the range of civilization itself. For upward of 30 years they have continued, enlarging from time to time, from a modest beginning to the most extensive establishment engaged in this line of business. They now have over 1600 names on their pay-roll. In the manufacture of their machines they use every day 60 tons of cast-iron, 15 tons of malleable iron, 40,000 feet of lumber and nearly three tons of brass. Such an establishment is a fitting monument to the energy, perseverance and business capacity of its founder, D. M. Osborne.

This enterprising firm has branch-houses in all the leading agricultural centers of the world, the California branch being located on Bluxome street, San Francisco, and under the management of Otis M. Goddard, who has been connected with the company nearly 20 years.

The mill of the Pacific Lumber and Wood Co., near Truckee, was burned on Monday. Incendiarism is charged, as it had been threatened that unless the two Chinese cooks were discharged there would be a fire.

ACCORDING to the Nevada papers the water in Lake Tahoe is lower than ever.

varieties, including some of the rarest and most beautiful roses in the State.

An exhibit in charge of Mrs. H. E. Highton was much admired for its rare and varied beauty. Some of the roses were so large as to be easily mistaken for cleverly made clusters instead of single blossoms.

A very attractive collection of ferns and wild flowers from the glens and meads of San Mateo county was shown by Mrs. Nat. Brittan of Redwood City.

One of the most extensive exhibits by a single person came from the gardens of Mrs. E. T. Crane of San Lorenzo. It embraced a vast variety of roses grown (as a card informed the visitor) on bushes that had not been irrigated for more than three years.

Mrs. Albert Miller of Oakland, Mrs. C. D. Holman of Santa Cruz, Mrs. J. C. Flood of Menlo Park, and many other ladies sent notable contributions. There were, as usual, numerous booths, where flowers, candy and refreshments were sold for the benefit of the Exchange.

Every evening 10 electric lamps made the hall as light as noonday, and Noah Brandt's orchestra, under the direction of Henry Heyman, added the charms of music to those of floral fragrance and beauty.

A great crowd attended the closing Saturday evening when Jos. D. Redding conducted an auction sale of plants; and it is understood that the show financially has been a decided success.

FARMERS' INSTITUTES to the number of 82 were held in Wisconsin last year, and 279 practical topics were discussed. More than 100 lecturers and specialists imparted instruction, and the State appropriated \$12,000 to help the thing along.

SALT LAKE citizens subscribed \$12,000 for advertising the resources of Utah Territory.

A Woman's Sphere.

BY CALLIE L. BONNEY.

A woman's sphere—to love, to serve, to trust,
Perchance in vain
To give the treasures of a loyal heart
And reap but pain.

And yet how oft what seemeth lost to us
Is sweetly ours;
And e'en the cypress wreath may bud and bloom
In fairest flowers.

A loyal love must find its own at last.
If earth deny,
Know that a recompense secure is thine
In starry sky.

And do not deem love's faithful service lost—
Reward awaits.
If not on earth, then know 'tis thine for aye
Beyond the gates.

The Downfall of Parson Squeels.

It had been an early frost, and already the leaves had unfurled their slender stems from the giant oaks and scarlet maples and drifted down in rustling masses. The trees stood grim and gaunt in the streaming moonlight that peered cautiously through their twisted limbs, penetrating every crevice and crack, save where a clump of pines stood huddled close together, as though guarding some hidden treasure.

Something made the dead leaves crackle—a breeze, perhaps, and the noise disturbed a fat hen roosting on the topmost bough of the tree. With a flutter of wings and a frightened cackle she flew down from her perch and hesitatingly stood, first on one leg, then on the other, till she had fully satisfied herself that no harm was meant; having done so, she returned to her place, and for a time all was still save an occasional cluck.

"Dat dat fool hen!" muttered a dark figure now stealing from behind the hedge. "Ef she don't heish dat racket, reckon Marse Tawn'll come out arter dis nigguh wid de shot-gun—en why so? We is de chilun of de earf, en de people of His pasjer, en de rich man got to feed us outen he plenty—dat's B'ble talk dat is, de Lawd made me an He made dat tukkey. I 'longs to mysef, en tukkey he 'longs to hissef, den wharfo' cyarn't me en dat tukkey jine han's?" And Parson Squeels looked questioningly at the diamonded maples whose dead boughs shook and rattled approvingly. "Sides, dat ole gobbler's a gittin' p'intedly survivr'us, en hits jos' a race twixt me and Mister Fox, en 'pens w'io gits dah fus'."

Shifting thus the weak voice of conscience with potent arguments, Parson Squeels grasped the lowest bough of the tree and agilely swung himself from limb to limb, noiselessly as a cat, till his long muscular fingers grasped the unfortunate gobbler by the throat; not a squawk did he utter, only a hoarse rattle; then his long neck hung lifeless across the parson's wrist. In a moment Abraham Squeels, with his prey tucked safely under his arm, was skirting along close to the hedge to avoid the moon's clear beams.

Far off a dim light flickered across the waste of dismantled corn-fields, and the stacks of fodder looked like sentinels at their posts—at least they looked that way to Parson Squeels, who glanced cautiously from side to side, and saw in every stick and stone an accuser ready to wrest the turkey from him.

"Um! dabs a light at Sis Randy Styles'! I see p'intedly fared of I go past dat way dat 'oman gwine 't see me en she gwine 't spicion somepin when she see dis hump a stickin' out er my coat hits a poor secret whut don't leak out we'n de wimmin gits a holt—dah now! dey done pit out dat light en I see blegged ter make tracks fur home. I done stole dis yah turkey f'um de fox, he, he, he! I ain't 'prived nobody er dis fowil 'cepin Mister Fox, 'case w'en de Tankagibben turkey done gone f'um de roos' hit's a sho' sign dat de fox done payed a visit."

As Brother Squeels hastened home, no warning voice whispered that as he passed the cabin, now wrapped in darkness, his worst enemy was stealthily watching him—looking through the one pane of glass in the window otherwise stopped up with a bad quilt and an old hat, a pair of sharp eyes glared upon him, and just as he shifted the weighty turkey from one arm to the other, the moon glided from behind the clouds and rested on the parson's anxious countenance.

"Cha'ty be a waitin' fur me, en she gwine be p'intedly proud 't have dis fine fowil. Hi Cha'ty!" as he reached the door of his small, neat cabin, "open det do' pretty brief, 'case my arm's sho'ly wored out!"

The door creaked open a quarter of an inch till Charity had satisfied herself that it was her liege lord who knocked, then it swung back on its hinges, revealing the hospitable

glow from the blazing logs. "Um! You done 'prise me, Ab'm! who done sont me dat turkey? Gib it hyar, 'case I got ter pick hit w'ile dis water's a bil'in'; somehow's 'nudder, I spicioned somebody gwine to sen' me a turkey en I see had dis water a bil'in' sence sun down."

"Stop right dar, Cha'ty!" as she was about to pop the fowl into the iron pot. "I's gwine to hab dat turkey cooked like dey uster 'fo' de wah." "How's dat?" "Wai, yer see dey leabs de feeders on en dey jis wraps up de turkey in a piece o' brown paper wid wet clay daubed roun' hit en bakes him in de hot ashes wid a fat bacin' rind inside er him fur ter flaber. You niggahs down on de Mississippi dunno nuttin' bout good cookin'—Huuccum I ter know so much?—I 'uz de cook w'en Marse Phil went a campin' out 'fo' de wah. Now gimme a string t'wel I hangs dis byird out on de nail at de warnut tree."

Brother Squeels, followed by his dutiful wife, swung the turkey over his arm, and crept cautiously round the walnut tree feeling for the nail which projected from its gnarled trunk; a faint sound among the leafless branches made them both start; a screech owl flew on the topmost limb, uttering a shrill hoo-hoo-hoo-hoo.

"Sign somepin gwine't happen w'n de squinch owl fly ober de house," muttered Brother Abe as he tied the turkey's legs together and left him waving to and fro in the darkness, while he carefully closed and fastened the door, shutting out the cheery glow from the fire which streamed across the path.

Parson Squeels had arduous duties before him on the morrow, and, as he toasted his toes in the hot ashes, looking meditatively down into their red depths, he heaved a mighty sigh which Sister Charity construed into a desire for a "leete somepin warm;" reaching up on the row of shelves in the corner, she brought down a jar of brandied peaches and a jug of black-berry wine.

"Dat squinch owl never meant nuttin', he jes' now flewed over Sis 'Randy Styles' cabin, en I reckon he wuz callin' for her, 'case she sholy is cantankrus en no denial ob dat."

"You know what I gwine ter do to-morrer, Char'ty?" questioned the parson gloomily.

"Yer gwine s'pell Sis Styles from de church."

"Well, w'en I 'uz out dah a stringin' up de turkey 'peared like I heard somethin' say, 'Be cyarfal, Abe Squeels, Sis Randy Styles kin hoodoo,' en dat squinch owl cum by en say, meanful like, 'hoo-doo—hoo-doo—hoo-doo!'"

"Go way, Ab'm, you sholy is childish! Git ter baid, case yer got ter put on yo' biled shirt in de mawnin' airly, en git radey fur de church."

"Sho nuff," assented Abraham, as he lay down between the blankets and was soon snoring resonantly.

Sister Randy Styles was surely cantankerous. She had systematically refused to give one cent toward buying the parson a frock-coat and an easy-chair; she had refused to come to the altar with the rest of her colleagues and deposit thereon a half-dollar in obedience to a request from the parson for a "leete change," and lastly she had left the church in the midst of the sermon, because, she said, "Brer Squeels didn't know nuffin' bout de Bible nohow!"

This last insult was too much for the mild parson, and it was determined at a meeting of the board that Sister Randy Styles should be suspended. Early on the Sabbath morning Brer Archie Ransom's boy hurried to the little whitewashed meeting-house to ring the first bell for church.

The bell was a newly acquired luxury and the pride of each individual member's heart, hence it was customary to ring on five different occasions before churchtime. On this morning in particular it was to be tolled from 9 till 11 o'clock, to give Sister Styles time to make her peace with God and man and repent of her evil ways.

Slowly and laboriously the boy pulled the rope down nearly to the ground, then let the cord slip slowly upward through his fingers; but no joyous peal clanged out on the soft November air. Only a muffled sound came from the bell. Again he pulled the rope, again the mournful thud, thud; and once more with trembling fingers he put out all his strength in one tremendous jerk, but with no better success.

Archie Ransom's boy was speechless with wonder not unmixed with alarm, and bethinking himself of all the tales of malicious spirits he had heard, he suddenly took to his heels, not stopping till safe beside his father's fire.

Parson Squeels had put on his "biled" shirt, and, astonished at the lateness of the hour, he walked briskly down the road to inquire into the meaning of it all, leaving Charity to prepare dinner. A little knot of men and women stood in the path talking eagerly, and as Abraham Squeels approached they dropped their voices, but made room for him in their midst.

"You people done furgot hits de Sabba' day, isn't yer?" he demanded. "Whyn't yer toll dat bell fur Sis Styles?"

No one spoke and Abraham looked wonderingly at their awe-struck faces.

"Is yer seed sperits? 'Pears like you is all moughty curus!"

"Sperits done tuk de bell away," some one ventured to explain.

"How do you know dat?" the parson asked anxiously, looking from one to the other.

"Case Brer Ransom's boy done pulled en' pulled en' 'peared like somepin kotch a holt er dat bell en' hit couldn't ring no ways."

"En hit ain't gwine't let go hits holt s'long ez Randy Styles say no!" came a mocking voice, breaking the silence that had fallen upon them all. As with one accord they looked up like frightened rabbits, they encountered the gleaming eyes of Sister Randy Styles herself. Her strong arms rested confidently on her hips and a scornful smile parted her lips, displaying two rows of dazzling teeth; her coarse black hair was combed up under a bright-hued head handkerchief, and anger or excitement had flushed her yellow face, tinging it with an orange glow.

"No! dat bell sharn't toll fur Randy Styles, but she can come 'thout dat, 'en Abe Squeels, ef yo' hab anyting ter say, be quick 'bout hit 'fo' I gits rade-y ter go! Come, Abe Squeels, ef yer ain't feared!"

The taunt had the desired effect, and the whole congregation filed into the church, headed by Sister Styles, who took her seat on the front bench, while Brother Squeels opened his book of laws and turned to Article 17, which provided that no member should speak disrespectfully of the rector under penalty of being expelled.

"En so, bredderin, I is 'bleeged ter state dat we fin' dis 'oman guilty, en she ain' no ways fittin' ter b'long ter dis church, whar we is all we'y partic'lar; we has sot oswers fur zumples ter dem leete chilun," pointing to the assembly of boys in the back of the church, who showed their white teeth approvingly.

"We cyarn't hab nobody 'mongst us whut'll backslide fum dey 'gagements, en I moves dat Sis Randy Styles farfets her seat in de amen corner, en w'en she feel de spirit movin' her ag'in she must git low and meek like a leete chile en den she'll be dipped en washed tiwel she am white ez snow. Air de committee all agreed?" turning to the elders on either side, who solemnly held up their right hands.

"Is de gemmen ob de committee done hed dey say?" demanded Sister Styles in a hard, determined voice.

"Yer lazy, backslidin' cowards, is yer done hed yo' say—stan' back—Randy Styles mus' hab her turn! stan' back, I say! she ain't got no liver, but she's free, en her tongue's free! You's all agreed, is yer—you ain't got de spunk ter git up en 'fen' fur a lone 'oman whut ain' done nuttin' but stood by her rights! You gwine take 'way her seat in de amen corner, is yer? You's been a covitin' dat seat a long time, yer sneakin' hypercrats! You helt up yo' right han's, did yer, you beeg mouf apes?"

Wal, I ain't gwine ter say nuttin' ter you, Dick Gheens, en you, Archie Ransom, but you, Abe Squeels—you, I mean!" pointing her long yellow finger at the trembling parson. "I see gwine t' see 'fo' I gits throo ef Randy Styles won't spel you 'etid o' you spellin' Randy Styles!"

"You ain't nuver 'oused me ob stealin' yet, is yer?" turning to the congregation. "Whut you all tink gwine t' happen w'en de parson takes robbin' de hen roos'? Not but whut I see seed many a hon'es man whut 'll some time er 'nudder git de rich white man's fatter' turkey—dat ain't de question—but de parson whut's tuk keer en 'vided fur by de flock, whus his bizness a holpin' 'bisse' to de bes' when de mo' zervin' has ter go empty handed. Humph, whut you all gwine say now?"

A groan of approval came from the wondering flock.

"You all done axed wharfo' dat bell won't toll fur Randy Styles; en I tell yer dat de sperits done cotched a holt, en somepin done clum up dar en fastened hits ef outer dat bell, en hit ain't gwine t' let go t'wel Abe Squeels done fessed up to dat turkey he stole las night! Ya'as yer better!" as the parson's back face turned gray. "You white-livered raskil, I ain't done wid you yit."

"You's all 'spended Randy Styles 'case she do' wanten to gib whut she done wuke fur ter help 'sport a beeg, lazy nigguh, en what yer gwine t' say when she tells yer dat he up en stole a turkey offen Marse Tawn Bowman's hen roos'? Ya'as, when us honest, hard workin' niggars cyarn fin' a turkey nowhars, he gets de fines' en fatter' f'um de top er de roos' en fatches hit home en hangs hit outside er his do'! I ain't been talkin' wid sperits fur nuttin', en las' night I dreamt I seed Abe Squeels a trabblin' long de road wid a tukkey underneaf he awm; den somepin say ter me dat tukkey gobbler cyarn res', en he gwine ter clime up dah in de bell so'at nobody cyarn come ter chu'ch ter see Randy Styles 'spended. Don't you folks b'lieve me? Sen' yo' boy up in de steeple, Brer Ransom, en who gits dat tukkey fus' kin hab him fur ter roas', 'case I 'low Abe Squeels ain't gwine ter ax fur none o' dat fowil!"

A stifled titter swelled softly through the church and Sister Styles stood solemnly pointing to the altar as Brother Ransom's boy triumphantly returned with an enormous gobbler hanging by the feet. Abraham Squeels had retreated farther and farther from Sister Styles' accusing finger, and as all eyes were turned upon Brother Ransom's boy the pastor sprang lightly through the open window, while Sister Randy Styles took the front seat in the amen corner; the bell once more clanged out a joyous peal, and the whole church joined in the weird, sweet hymn—

"Swing low, sweet cha'yit,
Come cyar me home!"

—Oregonian.

THE OSTRICH-FEATHER trade of South Africa is so depressed that the feathers which formerly sold for \$125 now bring only \$7.50, and the value of the birds has declined accordingly.

(Original.)

William Brown of Oregon.

[These lines were first published in *Punch*, but they have been changed so much in their migrations through the American press that the author begs to republish them here as first written by him.]

They called him Bill, the hired man,
But she, her name was Mary Jane,
The squire's daughter; and to reign
The belle from Ber-she-be to Dan
Her little game. How lovers rash
Got mittens at the spelling school!
How many a mute, inglorious fool
Wrote rhymes and sighed and dyed—mustache!

The hired man had loved her long,
Had loved her best and first and last;
Her very garments as she passed
For him had sympathy and song.
So when one day with sudden frown
She called him "Bill," he raised his head,
He caught her eye and faltering said,
"I love you; and my name is Brown."

She fairly waltzed with rage; she wept;
You would have thought the house on fire.
She told her sire, the portly squire,
Then smelt her smelling-salts and slept.
Poor William did what could be done;
He swung a pistol on each hip,
He gathered up a great ox-whip
And drove toward the setting sun.

He crossed the great backbone of earth,
He saw the snowy mountains rolled
Like mighty billows; saw the gold
Of awful sunsets; saw the birth
Of sudden dawn upon the plain,
And every night would William Brown
Eat pork and beans and then lie down,
And dream sweet dreams of gentle Jane.

Her lovers passed. Wolves hunt in packs,
They sought for bigger game; somehow
They seemed to see above her brow
The fork sign of turkey tracks.
The teter-board of life goes up,
The teter-board of life goes down,
The sweetest face must learn to frown;
The biggest dog has been a pup.

O maidens! pluck not at the air;
The sweetest flowers I have found
Grow rather close unto the ground
And highest places are most bare.
Why, you had better win the grace
Of one poor cussed African
Than win the eyes of every man
In love alone with his own face.

At last she nursed her true desire.
She sighed, she wept for William Brown.
She watched the splendid sun go down
Like some great sailing ship on fire,
Then rose and checked her trunk right on;
And in the cars she lunched and lunched,
And had her ticket punched and punched,
Until she came to Oregon.

She reached the limit of the lines,
She wore blue specs upon her nose,
Wore rather short and manly clothes,
And so set out to reach the mines.
Her right hand held a Testament,
Her pocket held a parasol,
And thus equipped right on she went,
Went water-proof and water-fall.

She saw a miner gazing down,
Slow stirring something with a spoon;
"O, tell me true and tell me soon,
What has become of William Brown?"
He looked askance beneath her specs,
Then stirred his cocktail round and round,
Then raised his head and sighed profound,
And said, "He's handed in his checks."

Then care fed or her damaged cheek,
And she grew faint, did Mary Jane,
And smelt her smelling-salts in vain;
She wandered, weary, worn and weak.
At last, upon a hill alone,
She came, and there she sat her down:
For on that hill there stood a stone,
And, lo! that stone read, "William Brown."

"O William Brown! O William Brown!
And here you rest at last," she said,
"With this lone stone above your head,
And forty miles from any town!
I will plant cypress trees, I will,
And I will build a fence around,
And I will fertilize the ground
With tears enough to turn a mill."

She went and got a hired man,
She brought him forty miles from town,
And in the tall grass squatted down
And bade him build as she should plan.
But cruel cowboys with their hands
They saw, and hurriedly they ran
And told a bearded cattle man
Somebody builded on his lands.

He took his rifle from the rack,
He girt himself in battle pet,
He stuck two pistols in his belt,
And mounting on his horse's back,
He plunged ahead. But when they showed
A woman fair, about his eyes
He pulled his hat, and he likewise
Pulled at his beard, and chewed and chewed.

At last he gat him down and spake:
"O lady dear, what do you here?"
"I build a tomb unto my dear,
I plant sweet flowers for his sake."
The bearded man threw his two hands
Above his head, then brought them down
And cried, "O, I am William Brown,
And this the corner-stone of my lands!"

JOAQUIN MILLER.

Farming for Women.

Among the new industries of women, farming is steadily and deservedly growing in favor. In the four States, Iowa, Kansas, Minnesota and Nebraska, there were, according to the census of 1888, 2379 farms owned and cultivated by women, and the number has very largely increased since that time. In Dakota, a young woman physician, in the leisure of a slowly growing practice, has homesteaded and is carrying on a farm, and two young women of sixteen in the same Territory are very successfully engaged in stock farming, while in California and Florida a very considerable number of women are profitably engaged in the culture of oranges and other fruits. The reversal by the Secretary of the Interior, in 1886, of the decision of the Commissioner of the General Land Office, declaring that women who had made homestead entries forfeited, by marriage, their right to complete the same, has doubtless tended to increase the number of women farmers, and by drafting off women to the new States and Territories may indirectly tend to relieve the Eastern States of their surplus female population, and of some of the perplexing problems incident thereto.

This is altogether a move in the right direction. Farming is entirely a suitable, dignified and profitable occupation for women. The prejudice against their employment in agricultural labor, which arose from the brutish and degraded condition of the peasant women in some European countries, and of the women of barbarous tribes, has been gradually dying out. It has come to be understood that the degradation of these women is the result of other conditions than the mere fact of out-of-door work, and it has come to be recognized that only the superintendence of the labors of a farm and its financial management are duties eminently suited to woman's best powers, but that the details of its work are by no means beyond her physical powers. The use of machines in large farming makes much possible to women which might otherwise be beyond their strength, but even the more arduous labors of pioneer farming, the felling of trees and fencing of land and breaking of sod, have recently been performed with entire success by young women of no less education and refinement than strength and courage.

Horticulture and floriculture are especially adapted to women, and market gardening is a truly ideal occupation for women whose education in practical finance is sufficiently thorough to make them equal to the management of a business which requires a large capital and involves many risks, but the labors of which are admirably fitted for women, and the profits of which, under intelligent management, are enormous and seldom failing.

One circumstance that renders farming pre-eminently desirable as an industry for women is that its demands are in no manner incompatible with their duties as wives or mothers. Nearly every occupation of equal dignity and profit has its fixed days and hours, and any irregularity in meeting its demands is disastrous; but the exigencies of farming permit of such flexibility of plans and arrangements as leaves ample room both for the ordinary and extraordinary demands of home and domestic life. Especially is this true of tree planting and forest culture, an industry which has yet to be developed in this country, and which is especially a woman's business, since women rather than men have a genius for minute care and for patient waiting, and find it more easy to live sparingly and self-denyingly while waiting for future returns.

Too much emphasis cannot be laid upon the gracious influences of the contact with nature, the free out-door life, the active exercise of farming. No more wholesome correction of the narrowing tendencies of women's lives, the minute economies, the petty carefulness, the anxious consideration of minor laws and traditions, inevitable in most of them, can possibly be found. A marked improvement, not only in the health but in the moral tone of American women, would be sure to follow upon their adoption on any considerable scale of this industry in its various branches.

Up to the present time, women farmers are found almost exclusively in the West or extreme South. Why should not New England women take up farming, and take it up right here, in their homes and on the farms which their fathers and brothers are abandoning for more remunerative work elsewhere? The problem of the industry of New England women is only more perplexing than that other problem of the rapid deterioration and abandonment of New England farms and homesteads. Granting that there is "not money enough" in a worn-out New England farm for an active and ambitious young man, there may still be enough for a woman, to whom a home in a settled country among refined associations, with the privileges of cultured society, churches, schools and libraries, is worth more than a chance of future riches. All over New England, especially in Maine and New Hampshire, are houses, large, roomy, luxurious even, in comparison with the city quarters of poor folk, standing deserted in the midst of worn-out farms, which, turned into timber lands, or even cultivated as farms, would give a home and health and happiness to the hard-worked, almost starv-

ing, widowed mothers of unruly city boys, who are growing up to be the pest and the problem of their time, but who, transplanted to such country homes, would be redeemed to usefulness and manhood. Or let it become an acknowledged and understood fact that the women of a family are fully competent to carry on the farm, leaving the men free to seek occupation in the neighboring towns and cities, and there will no longer be the pressing need of breaking up dear associations, and leaving ancestral homes, to seek in the Far West that livelihood which the old farm is inadequate by itself to give.—*Louise Seymour Houghton in Lend a Hand for May.*

YOUNG FOLKS' COLUMN.

Little May.

(Written for the RURAL PRESS by AUNT SUSIE.)

"Please, mamma, can I go down to the Falls to play, and can I take my new parasol?" asked a little girl named May. Her mamma said she could, so she started off, a very happy little girl.

She had on a fresh pink cambric dress, and a broad hat, and didn't at all need the pretty little blue parasol her aunty had given her, but she was so proud of it, her mamma let her take it. She walked some way from the house and at last came to a lovely brook that ran along in such a merry way for some distance; then it came to some large rocks, but, instead of thinking them too large to get over, it just gave a leap and dashed along, and made such a merry noise, and such lots of snow-white foam as it fell from the rocks to the ground, and because of this it was called "Little Niagara," and the boys and girls used to have nice times wading in the clear water, and sailing little boats, and I am sorry to say, thought it was fine fun to watch the little boats go to destruction over the Falls. I wonder why it is children love to destroy things?

Well, May watched the pretty pebbles in the stream, and picked out some that were worn round and smooth by the constant motion of the water, and carefully stepped from one large stone to another, and in that way crossed the stream several times, and gathered some of the sweet flag-root that grew all along in the water. By that time she was tired of the brook and went into a field near by, when, first thing she knew, she tripped and fell, and went right down on her pretty parasol, and, of course, broke the handle. She picked up the pieces and looked at them in despair, tried to use it with the broken handle, but found she couldn't. Then somehow it came to her mind to ask God to mend it. She was a very religious little girl and never forgot to say her prayers, so with a very happy heart she climbed over the stone wall and knelt down in a corner out of sight from the road with an instinctive wish to be alone, and in the simplest words possible asked God to please mend the parasol. When her little prayer was ended she climbed back over the wall, fully expecting to see the parasol mended, but to her utter astonishment there it still lay in pieces. It was impossible for her little heart to understand why God hadn't mended it, and with many tears and sobs she picked up the pieces and walked slowly home, and went to her mamma's room and said:

"I broke my parasol, mamma, and asked God to mend it, but He didn't, and I don't think I shall ever say my prayers again."

Her mamma felt quite shocked, and explained to her that no one would expect God to do such things. It took some time to convince May that she must say her little prayer even if God had not mended her parasol, and when night came she knelt down by her mamma's knee as usual and repeated her evening prayer.

In the morning she found her parasol mended, and exclaimed: "O mamma! God did mend it, after all."

Her mamma told her again she mustn't expect such things of God, much as He loved little girls, and told her her papa mended it, and that she couldn't use it for a few days.

In the house where May lived was an old-fashioned kitchen with stairs almost in the middle of the room, and May and her sister used to play tag round them till Kate, the Irish cook, was nearly crazy with the noise, but she loved the children very much, and was very patient with them.

May's sister's name was Sue. One day the children were playing, and dodged each other round the sides of the stairs, and raced till they were so excited they hardly knew what they were doing, and gave such awful yells. Poor Kate was tired out, and exclaimed: "Sowsan, will ye shtop?" and took hold of her as she raced by, but she might as well have tried to "shtop" the wind. Sue was going at such speed, she just took poor Kate right along, and she stumbled and so both went down. Such a laughing and kicking before they finally got straightened out. When they were once more standing, Kate said, "Och, murder! sure an' it's me bones that be broke. I'll niver catch hold of ye agin when ye are racing loike that. Sure an' it's the doctor's bill I'll be having to pay for me cracked bones!" But she soon found she was all right, and forgave the children as she had hundreds of times before. She

scolded them one minute and petted them the next, calling them "me own darlints" in the true Irish way.

The children taught her to read and write, and she was very proud and happy when she sat down to write her first letter. She wanted to say, "Sure an' I've got me wishins," but May told her a better way to express her thanks to them for teaching her to write.

May and Sue had a large attic to play in, and each had a dolls' house up there. May loved to be alone, and wanted her house way off from Sue's, but Sue was a more social little girl, and didn't want to be alone, but wanted her house close to May's, and when May insisted upon having hers "way off," poor little Sue cried, and sobbed out: "No bo—body would th-think I was your—your little sis—sister, to see me—me—way off—here."

May hesitated a moment, then said by way of consolation: "Nobody comes but those who know you are my sister; and if anybody should, I'll tell them," and she went about her play with a perfectly clear conscience; but poor little Sue never was as happy as she would have been if their "houses" had been close together.

Well, May often went to "Little Niagara," but she didn't take her parasol again. She used to gather great bunches of wild flowers and put them in a big vase at home, and as soon as she was old enough she studied botany, and in that way knew a good deal about flowers, and loved them all the more.

DOMESTIC ECONOMY.

SOUFFLE OF LEMON.—Proceed as usual for soufflé, by using the rind of two lemons free from pith in the milk instead of vanilla.

SOUFFLE OF RICE CREAM.—Use ground rice instead of the common flour, finishing the same as omelet soufflé, and using any of the flavors desired.

HAM CROQUETTES.—One cup of ham, two cups of potatoes, one cup of bread-crumbs, one tablespoon of butter and one egg. Make in balls, roll in bread-crumbs and fry in hot lard.

GRAHAM GEMS.—Take one egg, two teacupfuls of sour milk, a tablespoon sugar, a teaspoonful soda, a saltspoonful of salt and enough graham flour to make a somewhat stiff batter. Bake in greased iron gempans.

COCOANUT COOKIES.—Three cups of sugar, one cup of butter, one cup of sweet milk, two eggs, one cup of grated cocoanut, two teaspoonfuls of baking powder, flour enough to make a dough; roll out, cut in shape and bake.

FRIED EGGPLANT.—After peeling the eggplant, cut in slices one-half inch thick, pepper and salt them and lay one slice upon the other, leaving them to stand 10 or 12 hours. Drain off the liquor, dip in flour and fry brown.

OYSTER PIE.—Make two rich crusts, bake them in a pan with a cloth between to hold up the upper crust. Stew the oysters; lastly, beat in two eggs and a spoonful of cracker crumbs. Lift the top crust and pour the oysters in.

CUSTARD PUDDING.—Make a border of paste on the dish and fill up with custard, grate a little nutmeg on the top. Any kind of fruit pudding with a custard may be made in the same way, by placing them in the custard and sifting some fine-powdered sugar over before going to bake.

WAFFLES.—To make good waffles, take one pint of buttermilk, one teaspoonful soda, one tablespoon of melted butter, one teacup of flour, the yolks of four eggs and a small pinch of salt; beat the whites separately to a stiff froth and add them the last thing. Have the waffle tins well greased and very hot, pour in the batter and bake brown. When taken up, spread with butter and keep warm.

MARROW PUDDING.—This pudding may be made in various ways, but it is best with half a pound of ladies' fingers cake, and a quarter of a pound of beef marrow chopped fine, a quarter of a pound of currants well cleaned, half an ounce of candied lemon peel, a little nutmeg, a tablespoonful of powdered sugar, a saltspoon of salt, and half a wineglassful of wine or brandy. Put these on a dish and fill up with custard, having previously put a border of paste on the rim; about half an hour will do it.

PARSLEYED POTATOES.—Peel, quarter and wash as many potatoes as required, boil quickly in salted water until just tender, strain at once, and let them steam for a few seconds over the fire; add a liberal piece of butter and let it melt over the potatoes. Then strew over them some finely-chopped parsley, cover, and taking the handle with one hand and holding the lid down with the other, shake the saucepan so that the potatoes turn over a few times, then dish at once. This is an excellent way of preparing old potatoes.

OMELETTE SOUFFLE.—Break six eggs, place the yolks in one basin and the whites in another; add to the yolks three tablespoonfuls of powdered sugar, one-half tablespoonful of flour and a little vanilla essence. Beat well together, whip the whites, beginning rather slowly at first, increasing by degrees until it forms a stiff froth; then add the yolks, very gently beating up the whites as you add them. Have ready a silver or plated dish (for want of either use tin), and butter it well; place the mixture on it and put it into a hot oven. Look that it rises; if so, run a knife round it, sift some sugar on it, place it in the oven again, and serve, when well raised, immediately.

GOOD HEALTH.

For Fat People.

Intemperance in diet, indulgence in the excessive use of alcoholic drinks, too little bodily exercise in the open air—these are the more important of the causes which bring on corpulence, says a recent writer. As muscular exercise increases the production of flesh, inaction leads to an excessive deposit of fat. Alcohol acts in a manner precisely similar to that of fats, sugars and starches. It interferes with the destruction or combustion of the fat-producing materials, prevents them from undergoing combustion, as it is more easily destroyed by oxygen than they are. Certain diseases, such as any interference with the formation and development of the red blood corpuscles, the oxygen carriers, increase the disposition to the deposit of fat. The oxygen may enter the lungs, but without these carriers it is unable to reach the tissues where combustion ordinarily takes place.

The dangers of corpulence are many fold. All diseases accompanied by high fever are apt to follow an unusually malignant course in fat persons. The heat developed in these affections cannot be so readily lost by radiation or conduction as in the lean. The cold bath, the cold pack, and all forms of cooling measures fail to really reduce the temperature, and the fever is, in itself, a serious source of danger. The skin is constantly bathed in perspiration on slight exertion or when the external temperature rises. Hence, skin diseases are common and often intensely annoying among the corpulent. The breathing is interfered with by the accumulated fat, so breathlessness on exertion is common among them. The frequency of perspiration leaves the surface exposed to chilling influences which cause coughs, colds, bronchitis and pneumonia. The overloading of the heart with fat interferes with its action, so that palpitations and sudden faintness from partial failure of this organ to do its duty are not infrequent. The extra weight that has to be carried entails muscular exhaustion on exertion, such as is not felt by the thin person. The discomforts and dangers of obesity would fill a much larger catalogue, but it is not necessary to enumerate them all here.

The treatment of corpulence must vary with the cause. No rigid rules can be framed that will serve in all cases. If there is a strong hereditary tendency to it, a radical cure cannot be expected—only an improvement can be promised, and even this cannot always be secured. The prevention of it should be undertaken when a young person shows a strong tendency to put on an excessive amount of adipose tissue. One of the first things to be done in this direction is to regulate the diet. Immoderate indulgence at the table must be rigidly forbidden, yet the food must be in sufficient amount to secure all that the body requires for its needs. No starvation should be countenanced. Fatal weakness of the heart or permanent disorder of the digestion often results from irrational restrictions of diet. The temporary thinning is usually followed by a marked increase in the corpulence beyond what existed before the "Tanner plan" was adopted. A much better plan is to avoid exciting the appetite by too great variety of food. Prince Bismarck's physician succeeded in curing his patient by the very simple plan of making the meal consist of only one kind of food, of which he should eat as much as he pleased, and no drink of any kind to be taken at meals or until two hours afterward. By this means no unnatural appetite was encouraged, and the patient ate only what the necessities of the system really demanded. The diet should contain an abundance of albumen, little fat, and still less starch or sugar, when an earnest effort is being made to reduce corpulence or provide against its making its appearance. Some fats have to be taken, or the albuminous foods will not be digested or appropriated by the system. If signs of disordered digestion appear, the diet must be modified from time to time by the addition of articles which are usually forbidden. It is better to incur some of the prospective discomforts or even dangers of obesity than to ruin the digestion in the attempt to avoid them.

REMEDY FOR POISON OAK.—DON'T EAT THE LEAVES.—A correspondent of the *Morning Call*, who has suffered terribly from poison oak, was cured in a few days by using as a wash a decoction of wormwood leaves, made quite strong. The weed grows abundantly where poison oak abounds, so we find the poison and its remedy growing side by side. The correspondent further adds: "I hope no one will try that foolish idea of eating the leaves, for I should have tried it myself had I not seen a child, whose parent made it eat some, suffering in great agony, and narrowly escaping death."

REMOVING MOLES.—The fair sex owes still another debt to the scientist. A lady who had a mole on her shoulder and who, from this reason, was unable to display her otherwise fair and attractive corporeal possessions, has had an electrical operation performed with perfect success. The mole was perforated with electric needles in every direction. After a week the mole, which had been burnt to a black mass, fell off and left the skin in good condition. The new skin shows hardly a trace of discoloration, and she now wears the most fashionable ball-dresses with impunity and success.

The Week.

Local showers have been reported this week from most localities in the upper half of the State. Some announce that the moisture is enough to be of appreciable benefit in helping the late grain to fill its heads, but we imagine that in the most cases the shower has been too light to be of much account, or the grain too far advanced to be benefited. However, on the whole, it is much better for every sort of growth to have a cool, moist air than a drying blast from the north, so we accept the small favor as a comparative blessing.

A significant indication of the drouth is the fact that field and forest fires have begun thus early in Yuba and San Joaquin counties. It will be wise to use extra precautions against fires this year and to make extra efforts to save everything eatable by stock, because of the high feed values which are likely to prevail.

The question of freight rates eastward for fruit is under consideration by the Railway Managers' Convention, which is in session as we write, but no indications of results are yet discernible.

High Wages in the United States.

There is much discussion at this time as to the causes of our great prosperity, our high wages, our vastly increased wealth and our ability to pay taxes. Some are disposed to credit it all to the protective tariff; others think it arises from our financial policy and National banks; and there are not a few who affect to believe that the National debt is a great blessing, has spurred us up to increased industry that has made two dollars where we had one to pay.

All these theories are sheer mistakes. The tariff may have been a small factor in some directions. The National banks have done nothing but what the Government could just as well have done without them. The credit of the Nation is not one jot better for having all the banks behind it.

The real cause lies here in these few facts: We are but 60,000,000 of people to 3,000,000 of square miles of land; we cultivate only the first quality of soil; we cut only the best of timber; we work only the richest mines, and only the choicest fisheries; our labor is all skilled and lively; it is aided by the best machinery.

Now here are advantages on every turn that no other nation in the world presents. They have the effect of making the product of the day's labor from four to ten times what it is elsewhere. As compared with India the facts stand thus: Two hundred people to the square mile; tenth rate land cultivated by poor lifeless slaves, with no mechanical appliances; mines worked down to zero; fisheries the same; scrubby timber out for lumber. Result: The daily product not one-tenth of what it is in the United States, and more particularly in California.

England stands between these two: People to the square mile 300; twelfth-rate land cultivated; labor less skilled and energetic; mechanical aids equal to America; inferior mines worked; inferior fisheries; inferior forests; better market for farm product. Result: The labor and skill being about equal to that of the United States, the product would be the same but for the need to work poorer land, mines, fisheries, etc.

The Indian labor counts 1; the English counts 5; the American 8 or more. In fact, while this holds as to farm produce, the figures run up to 100 in some mechanical works.

Now this increased product must go to some one. Either the landlord, the worker, or the trader must reap the profit, or it must be divided among them all.

In India, as the people are numerous, and inferior land, etc., are worked, the owner of the superior soil, timber, mines and fisheries reaps large rents. As the people are numerous, and labor abundant, the worker and his wages are reduced to the lowest terms. The middleman picks up but little where wages are so low and surplus product so small.

In England, as the poorest soil, etc., is cultivated, the landlord reaps a great revenue from the rent of all that is above the poorest. A mine that would pay \$1 a day in India would be a treasure. In England it would just pay wages. In America it would not be worth a cent. In California no one would look at it.

It is seen that in India and England the landlord takes the lion's share of all, because 200 to 300 to a square mile make cheap labor and ready market.

In America he cannot, because first-class land alone is wanted. Few people keep wages up, and compel him to go abroad for consumers. Should he aim to advance his rent, the farmer would take second-rate land. But the product is there; the 8 to 1 of the Indian and 5 of the Englishman. Who gets it?

The workman gets a large portion of this product. There can be no doubt of that. His wages are better, and he can buy more with them than the Englishman, and far more than the native of India, but yet not the whole—not much more than one-half. The rest goes into commerce, and is gobbled up by merchants, transportation companies, syndicates, trusts, and other devices.

No people on earth have so much to gamble on, and no people gamble so much. Our entire system has become one of speculation, closely allied to mere gambling. Among no people are there so many that escape toil, live by their wits and permit themselves to tread the ragged edge of crime so near the brink.

These classes are absorbing too large a share of the national product. The successful leaders become millionaires in a decade, and in a lifetime pick up a hundred millions.

This is in itself positive proof that labor is not protected with a paternal care by the Government. Corporations, trusts and syndicates have had too much license. They are concentrating our immense production in a few hands, and really threaten the life of the Republic and the liberty and happiness of the people.

Every child born in the Republic has a right to find all the advantages that naturally arise from our free condition, open to it on arriving at maturity. It will have a right to work only the richest soil, mines, fisheries, etc. To do so with the best appliances and the highest skill, and to take the product for the toil, subject to fair rent and reasonable profits.

But trusts and corporations are preparing drag nets to intervene and take all the profits to themselves. They are aiming to monopolize the soil, transportation, the markets; to fix the price of labor on the bedrock, to put the price of the product on the top shelf, and gobble all the margin to themselves.

Not any tariff, but these natural resources have been the cause of our prosperity. Not high tariff, low tariff, or no tariff at all, can take them from us; but these trusts and syndicates may. They are fast seizing the reins of power and fastening round the Government itself, like a dreadful nightmare. Their aim is to absorb all the wealth of the country, and its liberties will not be secure when that is gone.

We have need to call the attention of our Government to their work, to devise means to counteract their schemes, to save the natural resources of the country for the whole people, and secure liberty and the Republic forever, by making every man feel that he has a country in which he can live like a man, and worthy of his love and devotion.

J. Lusk Co. Assigns.

The failure of W. T. Coleman & Co. has been followed by the assignment of the J. Lusk Canning Co. of Temescal. This is not, of course, A. Lusk & Co. of San Francisco. The Temescal cannery managers affirmed up to Friday last that the Coleman failure would not affect them. The liabilities do not exceed \$200,000, it is thought, but the entanglement of accounts with Wm. T. Coleman & Co. make it a matter of doubt. The company has large contracts yet to fill, and it has made many contracts with orchardists for the delivery of fruit. They hoped to make a profit of \$30,000 from the apricot season alone.

It is unfortunate to have these things transpiring just at the opening of a fruit season, but it is altogether likely that other arrangements will be made both to can the fruit and market it so that no loss will ensue. The apricot crop is so small that it will take care of itself, and probably before the peach crop comes on the trouble of the springtime will be forgotten. It is reported that a new firm has already arisen from the ashes of W. T. Coleman & Co., and it is suggested that the new firm will resemble the old one when the trouble blows over. Of the truth of this we know nothing, but we do not anticipate that any great or permanent hardships will result from the present occurrences.

Mechanics' Institute Fair.

At a meeting of the Trustees of the Mechanics' Institute, held last Tuesday night, many letters were read from county officials in different parts of the State, saying that their counties intend to make exhibits at the forthcoming exposition, and asking about space, freight rates, etc. Trustees Stump, Bassett and Hopps were appointed a committee to obtain information regarding freights and special rates for the benefit of intending exhibitors.

It is understood that on all branches of the S. P. in the State, perishable articles intended for the fair will be carried free, and non-perishable returned free.

In view of the fact that a larger number of county exhibits may be looked for this year than ever before, General Agent Stout recommends the removal of the Union hotel on Hayes street, and the erection in its place of a middle annex to the pavilion as increased room is needed. The matter is under advisement.

Irrigation in the Sacramento Valley.

An extended distribution of irrigation water over some parts of the Sacramento valley seems likely to be secured at an early date. The short rainfall of this year is stimulating enterprises in this direction, and the prospect of great demand for small farms with abundant water supply is inducing land-owners to take more than usual interest in securing water. The movement is noticeable all the way down from Shasta to Colusa county. One of the enterprises has just been put in shape at Red Bluff. The scheme involves a plan for tapping the waters of the Sacramento a few miles above the town and bringing it in canals down to where it may best be utilized. It is thought that \$15,000 will cover cost of ditching. Red Bluff citizens have organized to see the scheme through. J. L. Kimball has given \$2500, and Mrs. J. S. Cone, General N. P. Chapman, H. Cadwalader and others have made liberal donations.

This irrigation plan was suggested at the recent mass meeting held in Red Bluff under the auspices of the State Board of Trade. The speakers then reminded the citizens of the valuable water supply that was practically going to waste at their very doors—a water supply, it was said, which, if in Los Angeles or the San Joaquin valley, would have been made use of long ago. Perhaps the most potent exhortation was that of M. M. Estee, who is reported to have spoken as follows:

The speaker rode over Fresno county 18 years ago. It was then a sheep pasture; dry, barren plains, not fit for post-holes. No pamphlets were issued, no real estate circulars flooded the country, no conventions and long speeches to boom the country; but men got together, put up money and built a 45-mile ditch—30 feet wide and 5 feet deep—took the water out of Kings river and irrigated the barren, parched earth. Then the land was for sale, and in 10 years that land has increased in value 500 per cent. The Fresno land was no better, the climate was no better, than the land and climate of Tehama, and here you have scenery that is unsurpassed in the world. "What has made this wonderful change?" said the speaker. "Water, water, water," responded Mr. Estee. Here you have one of the most beautiful rivers in the world flowing past your doors—going to waste on to the sea—which ought to be utilized to irrigate your great, broad plains lying west and south of your beautiful town. Dig a ditch and take out the water. Irrigate these lands and grow alfalfa, fruit, vegetables and general diversified crops, on 10, 20, and 40 acre tracts. You must not depend on rain, although you have an average of 24 inches a year and grow good grain and all kinds of fruit without irrigation, but with it your land can be made a veritable paradise.

In Lombardy the rainfall is 32 inches annually, and still that people irrigate their lands, and a small territory, not larger than Tehama county, supports a population of 4,000,000 souls. "Stop pastoral life," said Mr. Estee, "and commence diversified farming; you will make more money on a 40-acre lot than you do now on 160 acres."

This is quite different from the "no-irrigation" doctrine which has been widely proclaimed, but it is not necessarily untrue. The use of water is to be determined by the locality and the nature of the crop. There is no doubt that water is a good thing and plenty of it, but it must be intelligently used.

MOQUELAMOS GRANT.—Dispatches from Washington, 14th instant, announce that the Supreme Court has decided the Moquelamos land case in favor of the claimants under the railroad title and against the settlers. At least 500 or 600 families are affected by the decision. The litigation has been going on for 20 years, and many lives have been lost in the fights that have taken place between the claimants and the settlers. The lands lie in the foothills of San Joaquin and Calaveras counties and have become very valuable.

SILKWORMS AT WORK.—About the time this paper is printed, a number of the silkworms at the new rooms of the State Board of Silk Culture will probably be busily at work spinning their cocoons. The rooms—at the corner of Market and Fourth streets—will be open to the public from 11 A. M. to 3 P. M. daily, Saturday excepted, and opportunity given visitors to observe the worms in different stages of development and to witness the operation of reeling.

THE Governor has appointed John Evans and N. D. Combs directors for Agricultural District No. 25.

Dealing in Futures.

We have received from Washington an interesting pamphlet containing the argument of Hon. B. A. Enloe of Tennessee before the House Committee on Agriculture, concerning the constitutional power of Congress to prohibit dealing in "futures" in agricultural products. This is a subject to which we have frequently alluded, and we have already mentioned the fact that there was a proposition before Congress looking to a prohibition.

The chief point in argument on the subject seems to be whether there is any power under the Constitution of the United States to interfere with any bet or gamble or trade between two individuals; but Mr. Enloe takes the ground that all dealings in futures have the effect of interference with interstate or foreign commerce. In one place he says:

The obstruction of a navigable stream over which commerce is carried would not be tolerated for a moment. The stoppage of the trains on any railroad handling interstate commerce would not be permitted to pass unnoticed. Transportation is only an incident of commerce; trade is the very essence of it.

Can it be true that the Constitution gives Congress the power to regulate only that part

tions. The fictitious trades afford the richest part of the harvest, and they represent every year many times the aggregate of any and of all of the products that are made the subject of speculation.

These fictitious trades frequently result in the looking up of the great bulk of the crop of the particular kind embraced in the speculation, which is thus withheld from the commerce of the country at the will of a combination of speculators, interrupting for an indefinite period the free and natural interchange of commodities among the States and with foreign nations.

We have during the last year seen the lamentable effects of too great speculative disposition in the conduct of business. The collapse of the grain corner of the Nevada bank, and possibly the failure of W. T. Coleman & Co., may be traced to transactions which approach nearer to produce gambling rather than to commerce. It is claimed that such efforts aid producers by creating a quick demand for their produce, which the speculator is compelled to make extra exertions to dispose of, etc., but we incline to the belief that such advantage to producers is mostly fanciful, and that any temporary advance is more than counterbalanced by subsequent reaction and depression. We admire energetic, enterprising

East Oakland.

There are few places in the world which combine so many excellencies as a place of residence as East Oakland. The wonderful mildness and evenness of its temperature, the remarkable healthfulness, the scenic and varied beauty of its surroundings, the high intelligence of its population, its educational advantages and proximity to colleges and good schools are among its superior advantages.

Referring to the pleasant glimpse of Fruitvale avenue, given on this page, we may remark that the streets of East Oakland are paved with macadam which makes a very smooth bed. The wooden sidewalks are rapidly giving way to cement walks, which are more cleanly and certainly more handsome. The rows of trees on either side of the streets in the spring and summer give the place a very charming and picturesque appearance. The drives along the broad highway known as the San Leandro road, the Redwood Canyon road to the north of Haywards and Laundry Farm, the Piedmont road along the head of Lake Merritt, and the Hays Canyon road to Moraga valley, not only place East Oakland in close proximity

QUERIES AND REPLIES

Taking Out Larvæ of the Bee Moth.

EDITORS PRESS:—In answer to a recent inquiry I would say, get your bees under control, then with the point of a penknife pick out the cocoons of the moths. You can detect by the glazed webs. The Holy Land bee or the Black Italian resist the moth better than the small brown bee. They fight better than smaller bees, and under difficulties are stronger and more competent to be equal to the occasion. Keep your colony strong both as to number of workmen and well to do in supplies. "Poor folks" are more easily discouraged.—GEO. KAY MILLER, Tempe, Arizona.

Esparcet or Sainfoin.

EDITORS PRESS:—I have seen an extract from the Carson Appeal relative to a forage plant from Germany, called Esparcet, which George Rammelskamp, who has for 14 years been the foreman of the Suto Tunnel ranch, in Nevada, says is the principal fodder plant of Germany; that it grows rank and quick, will do without irrigation, seeds down rapidly, and is perennial, and will grow on the worst land that can be found in Nevada. Have you any information regarding it? Please investigate and let your readers know if it is of value.—E. W. MORSE, Bonny Doon.

The plant is usually called Sainfoin, and is well known, probably, to our English readers. On the experimental grounds at Berkeley, it

[GLIMPSE OF FRUITVALE AVENUE (FROM SAN LEANDRO ROAD), EAST OAKLAND.]

of commerce which is the incident, and not the very essence of the thing itself?

If the power exists to regulate that which is an obstruction to the incident, that which obstructs the transportation and exchange, does it not exist in a greater degree to regulate and prevent certain kinds of illegal and unnatural trading, which in effect interrupts and obstructs the freedom of commercial intercourse and breaks down the natural laws of trade. If this power does not exist in the Constitution, then we should make haste to amend the Constitution, so that it will give Congress the power to crush out this pernicious system of trading.

Mr. Enloe seems to have a very good idea of the fundamental wrong in gambling in food and other agricultural products, and we trust he may enforce it upon the legislators. The following is his review of some of the evils of the practice:

The buying and selling of "futures" is a species of speculation which injures not only the unsuccessful trader, speculator, or gambler, as you may choose to call him, but when the products of the soil are the subject-matter of the transaction, it injures both the producer and the consumer, and it seriously interferes with the regular and legitimate exchange of these commodities through the established channels of commerce. Combinations representing millions of dollars of capital are formed. They break the market by flooding it when the producers would sell, and they force it up by withholding their accumulations from the market after the producers have parted with the great bulk of their crops. These are the actual transactions where delivery is actually made, but the actual transactions constitute only a small part of the business of one of these combina-

and progressive trade and those who succeed by it, but we apprehend nothing but evil from commercial gamblers.

A GRAND RABBIT-DRIVE is planned to come off near Pixley, Tulare county, on Friday, June 1st. The corral is to be set on Section 13, Township 23, Range 24. The wings will be each two miles long. Teams are to meet at 12 m. on the Hamlin ranch, six miles southwest of Pixley. There is a large artesian well at this place and teams can be well watered before starting. The start will be made at 12:30 sharp. R. T. Priest will be Grand Marshal, with Sam Hesse, Louis Keser, Will Hughes, M. F. Pixley, Sam Woods, Alma Hall and others for aids. The drive will be over about eight miles of ground and will conclude about 4 p. m. Free lemonade in a big wagon during the drive, and after it a barbecue also free. The large barn of Mr. LeClaire on Deer creek is to be floored for the free dance, which will take place in the evening.

FREE TRADE IN A NUTSHELL.—The Ukiah Press puts it tersely, thus: When the sheep-farmers of this country ask what they are to do with their flocks, if they are compelled to stop raising wool by the abolition of the wool tariff, they are told: "Kill your sheep for mutton and buy foreign-made cloth." That is an epitome of the whole free-trade doctrine. Kill your industries and buy everything in England.

to many beautiful suburban towns, but are unsurpassed in beauty and picturesqueness.

No more charming places for residences can be found in California than are now awaiting occupation in Highland Park and Fruitvale.

The Baptist College is in Highland Park, and undertakes the complete education of boys and girls, and for the latter department has absorbed the Perry Seminary for young ladies. H. E. McCune is President of the Board of Trustees, Rev. J. H. Garnett, Sec., and C. C. W. Dearborn, Treas.

AMERICAN HORTICULTURAL SOCIETY.—We have received from Secretary W. H. Ragan (Greencastle, Indiana,) a bunch of advance sheets of the forthcoming report of the society, which will contain the proceedings at the California meetings, and a review by Dr. Ridpath of the various excursions, receptions, etc., which the Eastern visitors enjoyed during their stay in this State. The sheets indicate that the report will be of much interest. They are furnished only to members of the society, and all may become such by sending Mr. Ragan the annual membership fee of \$2.

SENDS FOR SPUDS FROM SUTTER.—The Marysville Appeal says that Francis Channon, Sr., who used to live at Live Oak, but is now a resident of Illinois, writes to have some Sutter county potatoes sent him, as he deems them much better than any other kind.

did not do noticeably; possibly it is better adapted to interior conditions. We know little of the plant except what Mr. Rammelskamp says of it, but we would advise its trial on a small scale.

Ants and Watermelons.

EDITORS PRESS:—Can any reader of this valuable paper tell me what will keep ants from eating watermelon vines?—CONSTANT READER, Visalia.

THE rooms of the State Board of Trade have been honored during the past day or two with visitors from many distant places, among which may be mentioned St. Petersburg, Belgium, North Wales, London, Liverpool and the Canadas. Eastern visitors still throng the rooms, and nearly every State in the Union has been represented this week. The letter mail containing inquiries has from 30 to 50 letters daily.

IRRIGATING GRAIN-FIELDS.—The Visalia Times remarks that grain has been irrigated to advantage only in those places where it could be done by seepage. Our farmers have found out that it does not pay to flood grain. It takes the strength out of the land, and so bakes the soil that the grain is thin and generally single-headed.

THE Improvement Association's building at Sacramento, for the exhibition of the products of Northern and Central California, has been completed, and the 21 of June has been selected as the opening day.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

LIVERMORE VALLEY HAY.—*Herald*, May 10: The volunteer hay is very light this year, compared with the expectations and prospects of two months ago. Yet it is generally worth cutting and will be excellent in quality. There will be very little wheat in this vicinity this season. Nearly all will be cut for hay. Many barley-fields, too, will go down before the mower. It is therefore very probable that we shall produce more hay this year than last, or than ever before.

Contra Costa.

POTATOES WELL KEPT.—*Martinez Item*, May 15: J. D. Dixon of Pacheco was in town yesterday exhibiting potatoes raised on his ranch last year. He had three varieties that were dug last October which yielded about 100 sacks per acre. They are as crisp and sound to-day as when taken out of the hill. Potatoes raised on the same ground took the first premium at the Contra Costa Fair last fall. They are certainly marvels for keeping qualities.

Fresno.

HOGWALLOW LEVELER.—*Fresno Republican*, May 4: V. J. Fuller of Centerville, some three months ago conceived the idea of building a machine to be propelled by horse-power, which would level hogwallow land in a thorough and expeditious manner. The greatest difficulty to be overcome was that in this character of land the mounds are not all the same size or height; therefore a machine to work successfully must be completely under the control of the operator, for in some places only a few inches of dirt would need to be moved, while at other points it would have to be excavated to a depth of from two to three feet. With the ordinary scrapers or land-levelers, numerous trips across single mounds are necessary to remove the surplus dirt into the depressions. With Mr. Fuller's machine, propelled by six horses, a strip of land four feet in width can be leveled as fast as the horses can work. The machine has the general appearance of a header, and in front are a number of large revolving wheels upon which are fixed huge knives, on the principle of a planing machine. These knives shave off a slice of earth about one inch in thickness and to any depth required to 30 inches, and as they revolve at considerable speed, throw dirt either back between the driving wheels, or into a mammoth scoop if it is desired to carry the dirt any distance. A piece of hogwallow land melts away very rapidly into a smooth and level tract as this machine passes back and forth over it. Mr. Fuller has applied for a patent on his invention, and will make arrangements to have a number of them built at an early day.

CHAMPION STRAWBERRY.—*Fresno Republican*, May 11: There stands on the writer's desk an ordinary drinking glass, and in it, filling it completely, is a strawberry. This magnificent product of Fresno's prolific soil measures nine inches in circumference, is of the Crescent variety and was grown by G. W. T. Carter, about two miles from the postoffice, northeast of the city. The berry sent to this office is not the only large one Mr. Carter has picked, but being perfect in form and "sound as a dollar," he sends it to us and wants the locality that can raise a "bigger" strawberry to come to the front.

Los Angeles.

A ROSE HEDGE.—*Alhambra Cor. Times*, May 11: A pretty sight is the rose hedge forming the entire front boundary of Mrs. Ida Halstead's ten acres. Mrs. Halstead conceived the charming idea a few years since, and has contended womanly against gophers, stray stock and dry months, until she is at last rewarded with a fence decorated by nature in such exquisite taste that even the modern artist cannot complain.

ANOTHER FLORAL TRIUMPH.—*Santa Ana Herald*, May 12: The second Flower Festival, given by the ladies of Santa Ana and Tustin, closed Saturday evening in a blaze of glory. The ladies, who worked faithfully in their labor of love, deserve great credit for their arduous endeavors. The financial result was highly satisfactory and will place the funds of the free library in good condition.

Monterey.

FINE ORCHARD.—*Salinas Index*, May 3: Paul T. Romie's beautiful place of 19 acres is situated just outside the city limits, on the road leading to Hilltown. He purchased the land of Spencer Childers in the fall of 1881, and the next spring planted a cypress hedge all around the tract to protect it from the wind. He then planted fruit trees of the choicest varieties, as follows: 1200 apple, 300 pear, 250 plum and prune, 50 cherry, 40 apricot, 100 peach and 25 quince trees, a quarter of an acre of raspberries, 2000 currant plants, blackberries, etc. The raspberries are of the Cuthbert variety, and Mr. Romie estimates that he will have at least 2000 baskets of them this year. His 2000 currant bushes will average one box each. He dries his own prunes, and they are splendid—almost like huge raisins. The apricots and peaches are fully equal in quality and yield to those of Santa Clara county, while the apples and quinces cannot be excelled anywhere. Mr. Romie thinks that figs can be grown here as well as in any other portion of the State. The tall cypress hedge, which is kept neatly trimmed, protects the trees from wind and

frost. The soil is inexhaustible, being of the richest character 50 feet below the surface. Mr. Romie keeps his place free of weeds and in fine order all the time. Plenty of water is found seven or eight feet below the surface, but it is not of the best. He struck an abundant supply of pure artesian water at a depth of 86 feet. It is well worth a visit to the place to see the neatly-kept grounds, with their wealth of beautiful roses and other flowers, showing the result of well-directed labor.

PROLIFIC COW.—*Salinas Index*, May 10: Charley Louis of Blanco has a wonderful cow. She was five years old on the 4th of this month and has had seven calves. When two years old she gave birth to twin bull calves which were bought by Harvey Abbott; at three years of age she had twin heifers, one of which was bought by E. Hetherington and the other by W. H. Crowe; when four years old she gave birth to a single heifer calf now owned by Chas. Bardin; and a few days ago she again had twins, a heifer and a bull.

Nevada.

BEDROCK RECLAIMED.—*Nevada City Herald*: J. B. Ducray is demonstrating what can be done by work in this section of the State. He owns a tract of 35 acres of land just in the northern outskirts of town. The land consists of barren bedrock, the soil having been mined off many years ago. He has about four acres of the tract under a high state of cultivation, and has this spring added to the cultivable area two acres more. His method of preparation is as follows: He builds dams in the little ravines passing down through the tract, and as they fill up to the required level, with the debris washed down from above, by a system of wing-dams he spreads the material over the surrounding bedrock until he obtains a sufficient depth of soil. The two acres made this spring was from the debris which was washed out of the town water-works' reservoir, which that company has been enlarging and deepening. The two-acre tract is now as level as a house-floor, and has a soil composed of a mixture of bedrock and decomposed vegetable matter. Mr. Ducray's place is well worth a visit, as it will conclusively show what work will do in transforming what has heretofore been regarded as utterly worthless lands into the loveliest garden spots. Such lands need little or no irrigation, as the bedrock is a great storehouse of moisture, and vegetation growing there is almost tropical in its luxuriance. Mr. Ducray has two acres of clover, which was seeded in 1862. It has never been cultivated nor seeded since, and has never had fertilizers put upon it. The crop now ready to cut is a luxuriant growth. There has been no decline in the yield during all that time, which shows its permanent character and the natural richness of that kind of soil. One peculiarity of this ground is its natural warmth, for frosts seldom occur there. Probably the bed next to the surface absorbs enough heat during the day to ward off the cold in the night time. This fact shows the adaptability of such lands to the cultivation of grapes and fruit at this altitude. The owner of this place has about two acres planted in vines and fruit trees. Others have made improvements upon similar land in this vicinity. The late G. S. S. Getchell filled in the washed-out and abandoned tract on Gold Run creek, opposite his place, and the made soil has produced good crops ever since. Felix Gillet, by his enterprise and labor, has changed his location on Barren hill into a virtual paradise, and others, whose places are not now recalled, prove what work and patience will accomplish here.

Placer.

A NEW CHERRY.—*Auburn Republican*, May 9: I. Meyer of Lincoln brought to this office on Monday a branch of a new variety of cherry, which he has originated at his Virginia-town ranch. The tree is now four years old and is a seedling from the Royal Ann. The fruit this year was ripe on the 1st of May, and it is remarkable for the small size of the pits. The specimen branch shown the reporter contains over 100 cherries in a space of about two feet.

San Benito.

THE HORSE MARKET.—*Hollister Advance*, May 11: The horse market, as established by the Board of Trade, is a grand success. From a small beginning, in less than four months, the sales of a single day have footed up over \$5000. Above 40 horses were sold at the market. Saturday. The heaviest buyers were "Doc," Forester of S. F., who purchased 20 head, and R. G. Sneath of the Jersey Farm, who bought 10 fine animals for his milk-routes. Several others bought single animals. There is some little expense attached to these horse markets that has heretofore been borne by the members of the Board of Trade. In the first place, lists of all animals registered during the month, and up to the Monday preceding the market, are printed and sent to horse dealers all over the State. Then again, on market day, lists of all the horses registered, with the names of the owners, have to be printed and distributed to those in attendance. To meet this expense, it is proposed in future to charge a small registration fee. This has been fixed by the Board of Trade at 25 cents for each animal. Those who have animals for sale should register early for the next market day, the first Saturday in June.

San Bernardino.

ABUNDANCE OF WATER.—*Valley Echo*: Chino ranch boasts the largest flowing artesian well in the State. They have one well there that

flows 125 inches of water and is but 225 feet deep. A few wells like that would irrigate considerable land in good shape.

ORANGE SHIPMENTS.—*Press and Horticulturist*, May 12: As the orange shipments for the season are drawing to a close, the packers are sending them forward rapidly. The shipments Saturday were eight carloads, and five yesterday. The different packers are getting pretty well closed out for the season. Following is a review of the orange shipments from Riverside for the current season:

Shipments.	Cars.	Boxes.
December.....	18	5,271
January.....	54	15,559
February.....	143	40,860
March.....	203	57,558
April.....	193	55,243
May.....	47	13,332

Total to date.....658 187,814

COLD-STORAGE ORANGES AND LEMONS.—On the 17th of March D. W. McLeod picked some of his choice Riverside Washington Navel oranges and placed them in cold storage on the 22d of that month. On the 24th of March they were shipped to Chicago, where they arrived on the 3d of April. A few days since a gentleman took a basket of that same fruit and brought it to California in a Pullman car over the Santa Fe line. At Barstow he shipped them to Riverside by express, where they arrived on the 7th of May. Mr. McLeod, the grower of the fruit, started for Philadelphia on the evening of the same day, and took with him some of that same fruit for testing. Some of the oranges were brought to the Press office yesterday and sampled. They were not quite as fine as when they left the orchard, but they were in good condition and had not deteriorated in flavor. Before they get through their travels they will have gone over 10,000 miles. We also learn that some Riverside lemons, picked early in December, kept in cold storage till the 24th of March, were shipped to Chicago, arriving there in excellent condition. The rind was as thin as any foreign lemons in the market, and had a handsome straw color. They were favorably commented on by a dozen of the largest fruit-dealers on South Water street. Three weeks after being received and placed on exhibition in a show-window they were in excellent condition, notwithstanding the mercury had gone to upward of 80° on several days in succession.

San Diego.

A MODEL FARM.—*San Jacinto Register*: Last Friday we took a flying trip to the "model farm" of Col. Allen and Capt. Ferguson, about 1½ miles from the postoffice, on the county-road to Florida. They have just completed a rabbit-proof wire fence around the entire orchard. The farm consists of 150 acres, 20 acres being planted to peaches and 91 acres in barley. The orchard is in a fine condition, as the owners make it a rule to cultivate it every six weeks. The trees have a healthy green color, and for its age it is one of the finest orchards in the valley. Around the house everything is as neat as a pin. The major is a great gardener, and on every hand may be found flowers, climbing roses, vines, etc. After an elegant dinner the colonel showed us over the house, which contains four hard-finished rooms, each elegantly furnished. The kitchen stands back some 20 feet from the main building. The barn is large and well built, able to hold 20 or 30 tons of hay. A veranda runs the full length of the south side of the house, where, on an afternoon, one can sit and see in the distance Florida with her white-painted houses glittering and shining in the sunlight. To the left of Florida may be seen the snow-capped mountains towering above the clouds and the bright green valley below. While we sat there in silent meditation we could not help thinking of the possibilities and probabilities of the future of such a farm, of such a country, with such a soil and with such a climate.

Solano.

JAPANESE HELP.—*Winters Express*, May 12: The question of help is agitating the fruit farmers in this section. Since the stoppage of Chinese immigration, small though the decrease in number has been, labor has been getting scarcer and higher-priced each season, until now the question, "How shall we gather our fruit?" stares producers directly in the face. A number of growers—notably the Brink Bros. and G. W. Tissell—have employed Japanese and are satisfied with the experiment so far as they have gone. However, the supply is inadequate to the demand. The schoolchildren, all that can work, will probably be given employment in the several districts, and with this help the producers may be able to get along this season.

Shasta.

EDITORS PRESS.—The past winter has been remarkably dry. The oldest resident cannot recall a spring when the ground was so dry as at present. The only effect on the crops here, however, is that they must be irrigated earlier than usual. As compensation there have been no late frosts. There is considerable activity in the construction of irrigation ditches and other

improvements. Campers in search of health or a fine summer climate are beginning to arrive from the valley, while bands of sheep are passing to the higher mountains. The streams are full of trout, which afford sport to those so inclined. The yield of strawberries is something remarkable; a few rods square will supply any family. Potatoes form the standard crop for purposes of sale, being very productive and of the finest quality. There is another food product grown here that surpasses in flavor anything I have ever tasted elsewhere in California, viz., garden corn. Usually in this State, and especially in the cities, "roasting ears" are not thought much of because they are nearly tasteless, but in this soil and climate they are of such flavor and sweetness as to charm all who are mundane enough to like something good to eat.—P., *Shingletown*, May 10th.

Tehama.

THE OSTRICHES ARRIVE.—C. A. P. telegram from Red Bluff, May 14: This town is highly elated over the arrival of Dr. C. J. Sketchley and his ostriches from Los Angeles. They reached here last night and were conveyed to their Sacramento valley home to-day. This evening the citizens tendered a grand reception to Dr. Sketchley.

WOOL MARKET.—*Red Bluff Sentinel*, May 12: There seems to be a deadlock in the wool market. The wool-buyers to the number of eight or ten are caucusing in the Tremont hotel, while the wool-growers are quietly sitting on the sidewalk waiting for developments. Major Ward, who appears to be the "king-pin" among the growers, says J. S. Cone wrote him from Boston, unless Cone & Ward's wool brought a fair price to bale and ship it to Boston. The Major says he has sold \$21,000 worth of wethers and has enough money to pay the bills of the firm; consequently honors are easy. It is also whispered among the producers that unless the "bears" step up a notch, all the Tehama county wool will be baled and shipped direct to the Boston market.

Tulare.

CROP PROSPECTS.—*Visalia Times*, May 10: The outlook for grain-farmers in Tulare county is better than in any other county in this part of the State. In the upper part of the valley they will get barely enough for seed and feed, while here there will be a considerable quantity of grain and hay for exportation. The cool weather and moist winds of the past few days have had a surprisingly stimulating effect upon the grain. Many fields, which not long since presented the appearance of a total failure, have revived and now give promise of a fair yield. In numerous instances the stalks are green and full, and, though the soil is very dry, there will be sufficient moisture in the stalks to make good heads. Of course, much still depends upon the weather. A north wind would soon dry up these green stalks and effectually blight the grain. Present prospects, however, indicate that a considerable percentage of the crop will be saved either in the form of hay or grain. We can safely say that the summer-fallowed land will produce nearly a half crop. In the entire county there will be a large amount of grain hay. Comparing the present season with that of 1877 we have much to congratulate ourselves upon. The alfalfa-fields throughout the county are in a thriving condition, and there will undoubtedly be a very large yield of alfalfa hay. With the exception of the apricots the fruit crop will be large.

FEED PLENTY.—Sheep-raisers report feed abundant, both in grass and short grain. Very few sheep will be driven into the mountains this year, if those farmers having "short" grain are disposed to sell it at reasonable prices. Oak trees on the plains and in the hills are loaded with young acorns, and in case they are not affected by "blast" the crop will be large. This fact is cheering to hog-raisers.

Yuba.

SUN-DRIED VALLEY APRICOTS.—*Marysville Appeal*, May 11: Hugh Jones says that the sun dried apricots of this part of the State are fully equal to the best evaporated fruit produced anywhere, while the sun dried fruit of the bay and coast counties, on the other hand, is much inferior in color and quality to the evaporated. He has learned that San Francisco experts find it difficult to distinguish between our sun-dried apricots and the best evaporated apricots. The superiority of the sun-dried fruit is due to the absence of fog and dew, and also to the rapidity of the process. These advantages for drying are worth much money to the district. Mr. Jones says apricots will be a light crop this year.

NEVADA.

CLEVELAND BAY COLTS.—*Reno Gazette*, May 8: The first Cleveland Bay colts ever foaled in Lander county, and probably in the State, made their appearance at Leopold Steiner's ranch last Friday. The sire was the magnificent stallion Hamlet, purchased by W. D. Jones of Austin from Jesse Harris, the well-known Cleveland Bay importer of Colorado.

IRRIGATION PROJECT.—*Silver State*: The waters of the Owyhee empty into the Snake river, a tributary of the Columbia. They are not utilized for irrigation purposes, but flow to the ocean. It is said that abundance of capital can be had to build an irrigation canal from the river to Paradise valley, in the lower end of which there is a large body of rich land which requires only water to make it as productive as any in the State.

Lands For Sale and To Let.

Miramonte Colony

—IN THE—

GREAT ARTESIAN BELT, KERN COUNTY.

This tract comprises 2640 acres, all level land and ready for the plow.
In this colony is the

Greatest Artesian Well in the World,

And a perpetual water-right goes with the land bought. Tracts of 20 acres will be sold for \$500—only one-third cash; balance, one-third in two years, and one-third in three years, with ordinary interest.

Apply at once for best selection to

C. H. STREET & CO.,

Successors to Immigration Association of California,

415 Montgomery St., San Francisco.

Agricultural and Grazing LANDS FOR SALE.

7975 Acres of fine grazing and agricultural land, including 4000 head of fine grade stock sheep; abundance of water; 9 miles from Merced City, and near Merced River; price, \$7.25 per acre; 1000 acres good wheat land. Address

OSTRANDER & SONS,
Merced, Cal.

Or **N. C. CARNALL & CO.,**
624 Market Street, San Francisco, Cal.

CHICO VECINO!

Best location in the State of California for beautiful suburban

HOMES.

Located near the thriving city of CHICO, Butte County, California. Subdivided from the heart of the famous

RANCHO CHICO,

The well-known property of

GENERAL JOHN BIDWELL.

Town Lots and acreage property, from fractions of an acre upward. TERMS REASONABLE. For further particulars, address:

CAMPER & COSTAR, Real Estate Agents,
Chico, Butte Co., Cal.

Or **WM. H. MARTIN,**
809 Market Street, San Francisco, Cal.

Artesian Belt Land AT LOW FIGURES.

The southwest quarter of Section fifteen, Township twenty-three, Range twenty-four west, one-hundred and sixty acres of rich level land, near the center line of the Artesian Belt in Tulare County, five miles northwest of Alila, on the S. P. R. R., is offered for sale at the exceedingly low price of fifteen dollars per acre. Address, "Landowner," Box 2361, San Francisco P. O., or to the care of this paper.

FOR SALE OR EXCHANGE.

Ranch of 200 acres on Coquille River, Coos County, Oregon; 40 acres bench land 160 acres bottom, 80 acres under cultivation; 1 1/2 miles from Coquille City, one-half mile from steamer landing. An abundance of fine spring water on place. Price, \$1500 cash, or will exchange for California property in vicinity of San Francisco Bay. For further particulars apply to

H. GOETZ,
659 Clay St., San Francisco, Cal.

LAND & WATER FREE! 800 Acres Rich, Level Land.

To some one who will summer fallow and cultivate well, will be furnished free water and use of 160 acres of good land (S. E. Sec. 13, T. 21, R. 23) within 9 miles of Tulare, S. W. Forty acres formerly plowed. Land on all sides cultivated and pastured. Water for irrigation (if needed) free. Also (without water) 640 acres (Section 13, T. 23, R. 24), four miles westerly of Tipton and S. P. R. R., all in Tulare County and the Artesian belt. For particulars call on **E. M. DEWEY,** 7 miles S. W. of Tulare, or **A. T. DEWEY,** 220 Market St., San Francisco.

APIARIAN SUPPLIES for sale by Mrs. J. D. Enas, Napa City, Cal.

THE LOUISIANA TRACT!

SITUATE ONE MILE FROM THE FLOURISHING

City of Sacramento,

With a Population of 30,000, and

1/2 MILE from Terminus of an ELECTRIC RAILWAY, now in course of construction.

SUBDIVIDED INTO 5-ACRE LOTS.

Soil is Deep and First-Class Fruit Land.

CITRUS AND ALL DECIDUOUS FRUITS, and the choicest of Plants reach the highest state of perfection upon this soil.

30 ACRES OF TRACT IS GOOD ALFALFA LAND, from which three crops a year can be cut. 5 ACRES IN FRUIT, well attended to, will make a handsome income. One Acre in Strawberries will net \$400 a year.

WATER IN ABUNDANCE at a depth of 30 feet. One Windmill, costing \$80, will irrigate five acres.

PRICE FROM \$175 TO \$250 PER ACRE.

TERMS.—One-fourth cash. Deferred payments in five annual installments; interest at 7 per cent, free from taxes. Title perfect.

Healthiest Location and Best Market in the State.

PALM VALLEY!

TROPICAL WONDERLAND!

EARLIEST FRUIT LAND IN THE WORLD.

EARLIEST VEGETABLE LAND IN THE WORLD.

FINEST WINTER CLIMATE IN THE WORLD.

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?

DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?

DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?

DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND COMPANY

Has secured 2000 acres of this choice land; has subdivided it into 5 and 10 acre lots, which they are now selling at \$175 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. One hundred and seventy-five acres have now been sold on this basis, starting at \$150 per acre. The price is now \$175 per acre. The price will be advanced to \$200 per acre as soon as the second 100 acres is sold.

The Company has a Stone-walled Irrigating Canal, over ten miles in length, completed.

They are building a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the town site owned by the Company.

They are planting 160 acres to an orange grove, of Navel oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State.

No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

THERE IS NO FROST, NO FOG, NO HARD WINDS.

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

BRIGGS, FERGUSON & CO., General Agents,

314 California Street, - - - - - San Francisco, Cal.

OR RIVERSIDE, CAL.

SANTA YNEZ,

Santa Barbara County, California.

THE SANTA YNEZ LAND AND IMPROVEMENT COMPANY

Is now offering for sale at low prices and upon very moderate terms the choicest of

Agricultural and Horticultural Lands

Of the famous College Grant, in the aforementioned beautiful valley. The CLIMATE is perfect, SOIL rich and diversified, TOPOGRAPHY unusually varied and beautiful, a park-like growth of Oaks covering the entire valley. WATER SUPPLY more than sufficient for irrigation of all irrigable lands, and no alkali either in water or soil.

TRANSPORTATION FACILITIES superior now, and two trunk lines certain to pass through the valley within a year.

43,000 ACRES OF THESE CHOICE LANDS

Are for sale at from \$25 to \$150 per acre; terms of payment being one-third cash, one-third in two, balance in three years; six per cent interest on deferred payments.

To reach the Santa Ynez valley take any transportation line to San Luis Obispo, thence by Pacific Coast Railway to Santa Ynez or to Santa Barbara, thence by stage to Santa Ynez. Persons seeking lovely homes or lands for lonely or quickly paying investments, cannot do better than purchase here. For further information refer to

HORTICULTURE.

Sun-Scalding of Trees.

EDITORS PRESS:—For some years past rather mysterious dying off of young trees has come under my notice. Especially was this the case two years ago. These trees were standing on well-drained soil, and the theory that bad drainage or unseasonable development was the cause could not be applied to them; moreover, they were perfectly healthy below the root-collar. In almost every instance where I examined them a minute beetle of the family *Scolytidae*, and seemingly closely allied to the pear-blight beetle of the Eastern States (*Xyloborus Pyri*: Peck) is found tunneling through the tree. Its work was, however, different from that of the *Xyloborus*, as it is confined to the trunk or main branches, making straight passages right through the tree, and not tunneling around the branches as the blight beetle is said to do.

This year again there has been considerable complaint of trees dying off, complaints coming both from Santa Clara and Santa Cruz counties especially, but in every instance all the facts of the case could not be laid before me. About a week ago, however, I discovered in a five-year-old orchard a number of young apple trees, which had started out vigorously, suddenly showed signs of wilting. Examination proved that the bark on the southwest side was turning black, and that a state of fermentation of the bark tissue clear to the albumen had set in. In cutting off the bark a sour smell was very distinctly noticed, and in nearly every instance the minute passages of the small borer, looking like holes made by a pin, were visible.

Here then was a distinct case such as that reported so often, but in a stage where its true cause, viz., sun-scauld, seemed to be clear for the following reasons:

1. All the trees were standing in the hottest portion of the orchard, a southwesterly slope.
2. The trees were invariably damaged first on the southwest side, the decomposition spreading from this point. Generally, at the time of my examination, only a strip varying from one-third to one-half of circumference of the tree was affected.
3. All of the trees affected were of one variety (*Esopus spizenburgi*) which was the last to leaf out, and at the time of the hot wave in April completely leafless.

Physiological Reasons for the Damage.

During the rise of the sap in the spring, a great deal of sugar is carried in solution. By the intense heat burning the bark, portions of the tissues are destroyed, the passages becoming clogged, and fermentation naturally sets in from this cause. The minute beetle is attracted, its borings no doubt helping to spread the decomposition, which spreads very rapidly. To prevent the total destruction of the tree, prompt action is necessary.

Remedy.

The only remedy which can have any success is:

1. The partial or complete cutting down of the tree to a few main branches, the cutting back to be done in proportion to the damage on the main trunk.
2. The removal of all portions of the affected bark clear to the wood, and to a point where the tissues are not discolored, and the covering of the denuded portion of tree with grafting-wax.

Preventives.

From the foregoing it seems clear that the damage might be prevented by the proper shading of the trunk, or covering it with a white-wash which would reflect the heat. For this purpose a mixture of whale-oil soap, say one-half pound to the gallon added to the white-wash, would be advisable. The shading may be done by placing of shakes on the southwest side. It will be remembered that the damage is accomplished during a time when the trees are leafless and consequently low, of which I have always been an advocate. Stemmed trees would not prove exempt.

I would add that cases of sun-scauld have come to my knowledge from all over the State, and that all kinds of trees have suffered, especially, however, apples, apricots and prunes.

W. G. KLEE,
State Inspector of Fruit Pests.
220 Sutter street, S. F.

Queer Growth on a Peach Tree.

EDITORS PRESS:—I have discovered in my peach orchard what is to me a freak. Perhaps some of your readers have run across something of a similar nature.

When pruning my orchard last winter, I noted a sucker from a Salway peach, the bark of which was of a bright lemon color. It showed fruit buds in their proper places, and I determined to fruit it. The flowers were pure white, and this was to me surprising, having been among peaches all my life, and never having seen a white peach blossom before.

The fruit is well formed now, and much resembles the Lemon cling in shape. Have I struck something new? Perhaps you or some of your readers can inform me.

Los Gatos, Cal. W. H. THOMPSON.

THE DAIRY.

Dehorning Cattle.

EDITORS PRESS:—The practice of dehorning cattle appears to be growing in all parts of the country, and while I do not admire the practice, I am willing that those who desire to rob the cattle of those appendages which Nature, in her wisdom, bestowed upon them may do so. It is only a matter of taste, I suppose. However, before the practice becomes general, would it not be well to inquire what effect the dehorning of a dairy bull will have on his progeny? May it not affect his nervous temperament to such an extent that it will show itself on his calves? We are told that the breeders of race-horses take every possible precaution with their stallions lest the colts should be inferior, and what is true of the horse may also be true of the bull, and especially of those kept for use in dairy herds. I know that in some of the dairy sections of the Northwestern States, the practice of dehorning cattle is followed to a certain extent, but the practice has not been in vogue long enough to show whether the result will prove injurious to the bulls as sires or not. Until this matter is definitely settled, would it not be well to call a halt, so that if there are injurious effects they may be remedied before the matter is carried too far? All who are at all familiar with dairy cows are aware of their peculiar temperament and fine organism, and if these are in the least affected, the quantity and the quality of the milk is also affected. Can any of the readers of the PRESS tell from personal knowledge what effect the dehorning of bulls will have on their potency as sires?

R. P. MCGLINCY.

San Jose, May 14, 1888.

An Inside View of the Dairy Market.

The Grocer and Country Merchant of this city, which is well informed on the commercial side of California products, discourses on the dairy situation as follows:

The complaints of dairymen over the unprofitableness of the business, and their avowals that the industry was in danger of being irreparably injured if some protection was not afforded against free importations of butter and butter substitutes from the East, are still well remembered, utterances to this effect having been quite recent. Prohibiting the manufacture or importation of imitation butter was accomplished several years ago, but this did not appear to have the desired effect, for as late as last summer prices for California butter were about as low as at any previous period. Choice to select fresh dropped about a year ago to 18@20c, but it did not long remain at these prices, or producers might well have had good cause to be dissatisfied, for there is no doubt that it is impossible to turn out first-class butter profitably at these figures. Before the season was over, however, fresh butter sold up to 55c per pound, and firm as well as profitable prices were realized for pickled roll and solid packed. A more favorable opportunity for making money in the butter trade had not occurred in a decade. The dairymen who were in a position to take advantage of the situation pocketed the profits without even a sigh for the consumers who had to stand the expense, or an expression of relief at the agreeable turn in affairs. The dairymen cannot well be blamed on this score. Human nature is much the same everywhere. Consumers do the growling when prices go high, but when values are at a lower level than the cost of production, they generally fail to appreciate the benefit they are receiving. Most of the butter produced last season was out of dairymen's hands, however, before the late winter months when the high prices were realized. Neither did jobbers profit to the extent they might have done, as much of the stock held by them had passed into third hands before values advanced to any marked extent. The experience of last season, and a somewhat unfavorable year for the heavy production of butter, on account of green feed not being abundant, with perhaps fewer cows than last season, have combined to turn many dairymen into speculating in their own product. About all the dairymen who are sufficiently forehanded for the purpose are busily engaged in packing and are awaiting a high market next fall, upon which to unload. Some of them are reported to have already refused 30c per pound for pickled roll, and others are quoted as expecting to realize 40c or more. But there is no certainty of these extreme views being realized. Neither is it certain that those most sanguine would accept 40c were it tendered to-day. With an early autumn, dairymen may see fit to unload at lower figures than are now obtainable. Very close to 30c is at present being realized for select fresh butter, as between packing, shipping and consumptive demand, there is hardly enough offering for current requirements. At current rates this industry is certainly paying handsomely to the producer. Even Oregon dairymen, who complained last season that they could not compete with California butter, will now have a chance to recuperate.

The importation of cheap Japanese peppermint oil has had a depressing effect on the farmers of Wayne county, N. Y., and this year they will not plant more than half a crop.

Crops at the South.

EDITORS PRESS:—I saw it stated in the estimate made by the *Call* newspaper some time ago, that Los Angeles, San Bernardino, and San Diego counties would have a full crop of wheat and barley this year. I noticed afterward in the *Chronicle* that a reporter of that paper had interviewed Mr. Sloss, member of the State Board of Equalization, on the subject of the crops in these three counties, and he estimated them at half a crop, provided more rain fell, which has not happened. The fact is that the crops will be considerably less than half that of last year in the counties named, and that so large a proportion of both wheat and barley is being cut for hay, that the proportion of grain to that of last year will be about 40 per cent. The rains held off until late last winter, and when they did commence they were so heavy and continuous that farmers did not commence seeding until six weeks later than usual. Then the weather was so unusually wet and cold that the grain did not come up well, and much of that sown when the ground was so wet and cold did not amount to anything. In some localities on light soil the crops are much better than on the low land and heavy soils. Ventura county will have more than half the crop of last year.

The writer has just returned from an extended trip as far north as Portland, Oregon, and as far as his observation extended, and from information gathered from farmers along the route, he is led to estimate the entire crop of California at less than 40 per cent of the crop of 1887. On the other hand, the outlook for the fruit crop was never so good.

Los Angeles, May 12, 1888.

FERTILITY RESTORED.—The *Courier* says that a few years since a gentleman began farming an 80-acre tract in the Petaluma valley. The land is adobe and had been planted in grain continuously for 18 years. He took extra care in preparing the land and sowing the grain. His crop averaged only ten bushels to the acre. Now this same land had in former years produced as high as 50 or 60 bushels to the acre, and though the stratum of rich soil was several feet deep, he knew something was the matter. In all the 18 years it had been farmed continuously, without rest or fertilization, and it had given out. Though in debt, our farmer bought fencing material and cut his 80 acres into three lots. He then bought between 10 and 15 head of cows and put them on it. By using one lot for pasture for his cows, another for hay, and the third one for grain, and changing about each year, he soon raised the average yield of this land from 10 to 27 bushels to the acre. By this system of farming he not only enriches his land but makes it pay him a handsome profit over all expenses, and he tells us his land is becoming richer and more valuable every year.

THE CREDIT-FONCIER COLONY.—W. L. Zuber, for many years U. S. Vice-Consul at Mazatlan, came up to this city on the Newbern a few days since. From him a *Chronicle* reporter learned that there are a few colonists remaining at Topolobampo, who claim to be getting along very well. They number about 150, and are mostly engaged in agricultural pursuits. The land is good, but they need means to establish themselves as agriculturists. There is an excellent market for their products in the adjacent mining districts.

ADVICES from Island Mountain, Elko county, Nevada, state that notwithstanding the severe cold of last winter, a comparatively small percentage of stock perished. They are now rodeoing through that part of the country.

An Improved Derrick.

No doubt many readers will be interested in the new device which we illustrate herewith. The cut shows a derrick for stacking hay and grain in the field, which is easily moved about and set up in place. To erect the derrick, guys, attached to a plate on top of the derrick post, are fastened to stakes driven in the ground on either side and behind the derrick wagon, while a stake is placed in front of the wagon for another guy. The truck is moved slightly forward, which causes the derrick post to move upward on the forward motion of the truck, the guy in front of the wagon being kept slack until the derrick post is erect when it is made fast; at the same time the truck is stopped and the brake made secure. The derrick frame is raised or lowered by a windlass, the derrick arm being also moved in a horizontal or incline position by another windlass, both of which are mounted near the lower end of the derrick post. The fork rope passes over pulleys on the derrick arm and post, and thence over a pulley being on a link supported by arms to the under part of the truck, and by a link adapted to be secured to a stake driven in the ground under the truck.

"PNEUMONIA."

Why not Call this Terrible Scourge by its Rightful Name?

(New York Telegram.)

Many a strong, well-built man leaves home to-day; before night he will have a chill and in a few hours will be dead!

This is the way the dreaded pneumonia takes people off.

The list of notable men who are its victims is appalling.

It sweeps over the land like a scourge and destroys poor and rich alike.

Everyone dreads it. Its coming is sudden, its termination usually speedy.

What causes it?

Pneumonia, we are told, is invited by a certain condition of the system, indicated if one has occasional chills and fevers, a tendency to cold in the throat and lungs, rheumatic and neuralgic pains, extreme tired feelings, short breath and pleuritic stitches in the side, loss of appetite, backache, nervous unrest, scalding sensations, or scant and discolored fluids, heart flutterings, sour stomach, distressed look, puffy eye sacs, hot and dry skin, loss of strength and virility.

These indications may not appear together, they may come, disappear and reappear for years, the person not realizing that they are nature's warning of a coming calamity.

In other words, if pneumonia does not claim as a victim the persons having such symptoms, some less sudden, but quite as fatal, malady certainly will.

A celebrated New York physician told the *Tribune* that pneumonia was a secondary disorder, the exposure and cold being simply the agent which develops the disease, already dormant in the system, because the kidneys have been but partially doing their duty. In short, pneumonia is but an early indication of a bright's diseased condition. This impaired action may exist for years without the patient suspecting it, because no pain will be felt in the kidneys or their vicinity and often it can be detected only by chemical and microscopical observations.

Nearly 150 of the 740 deaths in New York City the first week in April (and in six weeks 781 deaths) were caused by pneumonia!

The disease is very obstinate, and if the accompanying kidney disorder is very far advanced, recovery is impossible, for the kidneys give out entirely, and the patient is literally suffocated by water.

The only safeguard against pneumonia is to maintain a vigorous condition of the system, and thus prevent its attacks, by using whatever will radically and effectually restore full vitality to the kidneys, for if they are not sound, pneumonia cannot be prevented. For this purpose there is nothing equal to Warner's safe cure, a remedy known to millions, used probably by hundreds of thousands and commended as a standard specific wherever known and used. It does not pretend to cure an attack of pneumonia, but it does remove the cause of and prevent that disease if taken in time. No reasonable man can doubt this if he regards the personal experience of thousands of honorable men.

When a physician says his patient has either bright's disease or pneumonia he confesses his inability to cure, and in a measure he considers his responsibility ended. In many instances, indeed, persons are reported as dying of pneumonia, heart disease, apoplexy and convulsions, when the real cause of death, and so known by the physician, is this kidney consumption. Thousands of people have it without knowing it and perish of it because their physicians will not tell them the facts! The same fate awaits everyone who will not exercise his judgment in such a matter.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

M. A. HEINLEN'S IMPROVED DERRICK.

The team for pulling the wagon can be attached to the lower end of the fork rope. A fork of any improved pattern is attached to the lower end of the rope and the fork and rope are then manipulated in the usual manner. For particulars and prices, address the inventor, M. A. Heinlen, San Jose, Cal.

DEALERS IN

Agricultural Implements, Buggies, Buckboards, Carts, Harness, Etc.

CALL ON US

OR SEND FOR CATALOGUE

Of our large line of Vehicles and Harness for Farm, City and Livery use. Including, as it does, all grades of work and every variety of style, an investigation will well repay you. Of low-priced Buggies we have the best work, for the money, in the market. Numerous improvements for 1888 place it far in the lead of anything on the Coast—quality and price considered.

A COMPLETE ASSORTMENT OF HIGH-GRADE WORK.

SPRING WAGONS OF EVERY STYLE.

FINE HARNESS, Etc.

PATENTED MAY 11, 1886.

THE PRINCIPLE OF THE FLINT consists in the spring being attached under the shafts, and connected with each seat arm by OUTWARDLY FLARING SHACKLES which entirely encircle the shafts and WORK INDEPENDENTLY of them.

WHAT THIS PRINCIPLE ACCOMPLISHES.—The weight of the driver in his seat causes NO LATERAL OR VERTICAL MOTION OF THE SHAFTS. It prevents any galling or chafing of the horse. The driver not only rides with perfect ease and comfort, but ABSOLUTELY STEADY. The shafts always balance, regardless of the different weights of drivers, and are not affected by his weight when riding on uneven roads.

CONSTRUCTION, MATERIAL, ETC.—Shafts, Cross Bars, Seat Arms, etc., are of the very best selected, seasoned second growth white ash. WHEELS are of the finest quality Pinneo & Daniels compressed band. SPRINGS, best Swede steel and oil tempered. AXLES, Liggett's double collar interchangeable steel axles. Cane seats, tipped and leathered Shafts, and the best finish and proportions of any cart manufactured.

THE OSBORNE SELF-BINDER.

The Original and ONLY ALL STEEL Frame Self-Binder Made.

NO HUMBUG! NO MISREPRESENTATION!

BUT COLD, UNDENIABLE FACTS!

All farmers familiar with the history of Binders the past three years recall the fact that the Osborne is the only Self-Binder made with AN ENTIRE STEEL FRAME, while our imitators are only such in part—if at all.

BEWARE OF IMITATIONS AND SECURE THE BEST.

Combined with our Steel Frame we have

MALLEABLE GEARING,

Making it light in weight and draft, yet strong in construction. Handsome in design, simple in arrangement. It is easily operated, seldom gets out of order, and is a complete machine in every particular, and works like a charm.

IT WILL HANDLE THE SHORTEST OR TALLEST GRAIN,

As it can be adjusted to cut as low as a Mower, or nearly two feet high. Has 5 foot elevators, and is the only machine built expressly for the Pacific Coast trade.

Our Sales in California in the past three years exceed those of all other Self-Binders combined,

Showing conclusively that the farmers appreciate the many points of excellence possessed by

The World-famous Osborne All Steel Frame Self-Binder,
WITH MALLEABLE IRON GEARING.

Must be seen to be appreciated, so be sure and examine it before buying any other machine.

We also manufacture and carry a full line of Mowers, Independent Reapers, and Combined Mowers and Reapers. The whole comprising the most complete assortment of first-class cutting machines made.

Having the entire production of TUBBS & CO.'S CELEBRATED PURE MANILLA BINDING TWINE for 1888, we are prepared to furnish agents and farmers direct.

OSBORNE EXTRAS FAR LESS IN PRICE THAN OTHERS.

ENTOMOLOGICAL.

Hydrocyanic Gas Treatment of Trees.

University Experiment Station, Bulletin No. 79.

In University Experiment Station Bulletin No. 71, it was shown that hydrocyanic acid gas could be used effectively against scale insects; but that the tree suffered by the treatment. In a subsequent bulletin (No. 73), it was shown that the injury to the foliage of citrus trees could be prevented by the use of carbonic acid gas, injected at the same time with the hydrocyanic. The cause of this preventive action was not readily explained and its failure to protect on very hot days, showed that something remained to be done in perfecting the treatment; furthermore, the additional trouble and expense of this improved treatment made it highly desirable to seek for some easier means of saving the foliage.

The investigations here recorded were made from time to time during November, December and January of 1887-8, in order to find out what caused the injury, and likewise to explain the protective action of the carbonic acid used in the later experiments. The general manner of treatment as applied on a large scale, was followed in each operation; and suitable apparatus was devised for carrying out the details. A barrel of about five cubic feet capacity was used as a chamber to replace the tent. A small bellows was used to produce the necessary circulation, and a glass bottle, into which was inserted a closed funnel holding the proper doses, served as a generator. A small Woulffs (three-necked) bottle served the purpose of a "relay," where the gases could be mixed, or material for drying them inserted. The temperature was indicated by thermometers placed in the top of the chamber.

A half-dozen orange branches set in pots, and a dozen well-potted orange seedlings, were used to experiment upon. The former were used to obtain some preliminary measure of the quantity of materials to be employed in the later treatments.

THE FOLLOWING TABLE SHOWS THE ARRANGEMENT OF THE SEVERAL EXPERIMENTS; NUMBERED FOR REFERENCE.

No. of Expt.	Materials Used.	Method of Treatment.	Temp. Deg. Fahr.	Remarks.
1	Not treated.	Wet	59

31	Formic Acid.		55	

The second column shows the material employed; the third indicates whether they were used in the solid condition (dry), or in solution (wet).

When operating in the "dry" way the salts were used in the solid form, and usually the gas was further dried and freed from ammonia by passing it through strong sulphuric acid. In operating in the "wet" way, solutions of the salts were used and the gas was passed directly into the chamber, except in one or two cases where the gas was subsequently dried. The fourth column indicates the temperature at which the air in the chamber was kept.

In No. 1 an orange limb was used, potted like the others and left untreated to serve as a check. It remained in good condition throughout the time of experimenting.

In the numbers following, the conditions were varied both by changing the manner of treatment and materials used. The doses used were larger in proportion than those used in field-work, in which it was shown that small trees required proportionately larger doses than large ones.

In several cases the trees and the inside of the chamber were sprayed with water, to note the effect of the gas upon wet trees, and also to

*It should be noted that an essential point in the mode of operating, first practiced by me at San Gabriel in the spring and summer of 1887, was the use, at the suggestion of Prof. Hilgard, of a pump or blower for the purpose of mixing the gases generated with the air in the tent, by continuous circulation; thus avoiding injury from the effects of overdoses at some points while leaving others without adequate treatment, as must inevitably happen where no such equalizing apparatus is used. It was doubtless from this cause that experiments previously made by others (understood to have employed hydrocyanic gas) were not satisfactory.

note that of the water upon the gases themselves.

Production and Effects of Ammonia.

It is known that when cyanides are present in generating hydrocyanic gas, more or less ammonia is produced. In the materials used for these experiments, this may have been the case. Furthermore, under certain conditions, ammonia may be produced in the treatment of simple cyanide with acid. Preliminary tests were made to demonstrate these facts, and to study the reactions when applied in various ways, as well as to determine the best mode of using the materials. For the intense scalding effects of ammonia upon the foliage had been noted in my former experiments (see Bulletin No. 71), and it was conjectured that this gas, unintentionally produced, might be concerned in causing injury in cases not otherwise easily explained.

As previously reported, it was found impracticable to use the cyanide of potassium without first dissolving it, and that it was necessary to keep the carbonate of soda well mixed with the cyanide, so that the reaction upon both would occur at the same time. But it was further shown that the alkaline reaction of the gas, due to ammonia, is produced only when the solution, instead of the solid cyanide, is used; rapid addition of the acid to the dry salt, or vice versa, invariably produced an acid gas, while the slow mixing of the two materials in solution invariably produced decided alkalinity, often to a very harmful degree. The amount of ammonia was found to be variable, perhaps largely because a part was masked by the hydrocyanic acid produced during the violent action that takes place when the acid is added rapidly to the solution.

All the experiments with the dry cyanide alone showed but slight injury to the foliage, and a slightly increased injury was noted on the plants treated with the cyanide solution alone. When the carbonate of soda was used with the cyanide in the solid form or in solution, the injury to foliage was in either case very materially lessened. Passing the gas through sulphuric acid produced results similar to those of the carbonate treatment, viz.: immunity to the foliage.

Indications having thus pointed toward ammonia as the cause of the injury, some direct experiments were made with this gas. In the first ammonia-treatment the gas was separately generated and mixed with the hydrocyanic gas from an ordinary treatment, the mixed gases being conducted into the chamber.

The intensely acid action of the gas leaving the hydrocyanic generator at once turned to the alkaline, and so continued in the chamber, thus showing that a certain moderate excess of ammonia was present. Decidedly injurious effects upon the foliage were quickly noted.

In this experiment the ammonia and cyanide gases were mixed in the "relay." In order to leave more of the ammonia free to act upon the foliage, it was injected directly into the chamber, where the two gases were less intimately mixed. Upon circulating the gas, strong alkalinity prevailed in all parts of the apparatus and the atmosphere about the tree was decidedly charged with ammonia. The results were very marked. In a short time the trees wilted; in 10 days all the foliage was crumpled up and later all fell off. Even the wood of the more tender branches was noticeably affected.

As formic acid is often produced during the decomposition of a cyanide, an experiment was made to determine its effect upon foliage. A solution of the acid was boiled and the vapor was conducted into the chamber until a quite decided acid reaction was shown by the test papers. No harmful effect was noticeable. Formic acid and ammonia were next separately introduced, the ammonia being in very slight excess. In this case also no noticeable harm was done.

Influence of Temperature.

It is to be regretted that the normal temperature (50° to 65° F.) during the experiments was much lower than that which would be met with in actual field-work; and therefore the injury done to the seedlings would not be so marked as in the latter case.

An attempt was made to raise the temperature within the chamber up to that of a warm summer's day in the orange districts. The range of temperatures used was 95° to 105° F., but the outside temperature being low, as soon as circulation began, the moisture from the interior of the chamber, given off during the rise in temperature, was partially drawn in and condensed in the tubes during the circulation, and thus absorbed the ammonia as well as part of the hydrocyanic gas.

Notwithstanding this partial removal of ammonia by absorption, the results showed that these high-temperature treatments produced more injurious effects than similar treatments at lower temperatures.

Conclusions.

From the foregoing experiments we are led to believe that ammonia has been the fruitful cause of the injury to the trees subjected to the treatment under discussion. Under this view of the case, the beneficial effects of the use of carbonic acid gas would seem to be due to its power of neutralizing the ammonia, with the formation of carbonate of ammonium, when the two gases come together. And, furthermore, the failure of the carbonic acid to completely preserve the tree during the hot part of the day follows from the easy decomposition, by heat, of the carbonate of ammonium, which does not occur during treatments at lower tem-

peratures. Even the formate of ammonium, produced in a preceding experiment, would be decomposed in a like manner and some ammonia set free to act upon the foliage.

Modes of Preventing Injury.

There are, then, two means of averting the injury to the foliage: First, by the use of the dry salt; second, by the use of proper appliances to absorb the ammonia as it leaves the generator.

In the first case, viz.: Using the dry salt, only a minimum amount of ammonia is produced during a strong reaction. But it was shown that it is quite impossible to handle the dry salt so as to insure complete action of the whole dose; and furthermore, the slowness of the action prevents the rapid injection of the gas into the tent. It should be injected rapidly so that complete circulation of the gas about the tree may be established and the maximum effect produced at once, so as not make it necessary to increase the time of exposure.

In the second case, viz.: the use of the solution, the action is rapid and the injection can take place immediately. But with the use of solution, the trouble from formation of ammonia comes in. This can be obviated by the use of the proper apparatus to absorb the ammonia as it leaves the generator.

The apparatus used in field-work can be so modified that an absorbent of the ammonia may be inserted at the exit of the generator and connected with the general circulation. Such an apparatus can be made of a cylinder filled with loose pumice-stone over which sulphuric acid is poured from time to time. By this means a large surface is exposed for the absorption, and it can be readily so arranged that with slight trouble the surface of the pumice-stone can be re-saturated with sulphuric acid.

This apparatus, if interposed in the tubes through which the general circulation takes place, would interfere with the rapid passing of the volume of air which is to accomplish the agitation within the tent. In order to avoid this obstruction, a secondary circuit may be connected with the general circulation, to be used only when the generator is to be cleared of the last portion of the hydrocyanic gas. The pressure of the gas alone during its evolution is sufficient to force its way slowly into the general circulation. Thus the general circulation and agitation remain independent of both generator and drying-chamber. The secondary circuit carries a volume of air from the blower through the generator and through the drying-vessel and thence discharges into the general circulating pipe. This is accomplished by placing a hinged valve at the exit opening of the blower into the circulating tube in such a manner that the current of air may be passed either forward or backward by reversing the motion of the blower. The air may be forced by the backward movement through the secondary circuit.

By the application of either of the above methods the use of carbonate of soda can be avoided, and the work somewhat simplified. There will be far less residue in the generator, so that several treatments may be made without emptying the latter. Beside this there will be a decrease in the expense through the omission of the carbonate and the correspondingly less amount of sulphuric acid required. It will be necessary to demonstrate by further experiments whether the use of the cyanide alone will be so effective against the scale as when combined with carbonic acid. The best results of field experiments have accompanied the joint use of carbonate and cyanide, although it is maintained that the cyanide alone will produce as fatal effects upon the insect.

Some tests were incidentally made to note the effect of the gas upon the scale insects *Aspidiotus* and *Lecanium*. Branches of laurel and acacia infested with these scales were placed in the chamber during the treatment of trees at higher temperatures. The effect in some instances was complete, while in others 90 per cent of the insects were killed and the remaining 10 per cent still showed faint signs of life and may have survived the treatment. Under the proper treatment this gas remedy will undoubtedly prove as effective on these scales as upon the white scale, against which the remedy was originally intended to be applied.

Berkeley, May 5, 1888. F. W. MORSE.

A Rare Chance.

The Gabilan Rancho, situated in Monterey county, containing 7665 acres, is offered at \$36.00 an acre, for 30 days, on long time and easy terms. Address, J. C. HOAG, 312 Van Ness avenue, San Francisco.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE!

FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 2, 1886.

Dr. J. Koenig—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.85 "
Insoluble Phosphoric Acid.....	2.33 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

Berkeley, Nov. 20, 1886.

Dr. J. Koenig, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—is in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

L. E. ASHLEY'S

Patent Farm, Ditch and Levee Scraper.

Patented January 3, 1888

This Scraper is the best implement in the market for

Making Levees,

Irrigating Canals, Roads,

Ditches, Reservoirs,

And for all Purposes

Where Embankments are

Required.

The team travels on firm ground, and the soil slides off to the right and an embankment can be worked up in less time than with any other scraper, using the same number of animals.

By using this machine, for the purpose of throwing up an embankment under a fence, much lumber or wire can be saved and the embankment will act as a preventive against stock being injured.

By the use of the levers the Scraper can be made to take more or less land, raise the soil to a greater or less elevation and to a large extent guide the Scraper independent of the team.

Elevator 12 Front St.

News in Brief.

LIVERMORE is now illuminated by electric lights.

Two large schooners have sailed from Seattle for halibut fishing.

The death of Dom Pedro, Emperor of Brazil, is momentarily expected.

HEAVY frosts in Illinois and Michigan have done great damage to vegetation this week.

THE San Francisco Free Library, which now contains 70,000 volumes, will soon be removed to rooms in the New City Hall.

PACIFIC COAST Senators are endeavoring to have the appropriation of \$200,000 for improving Oakland harbor raised to \$500,000.

THERE are 53 fruit distilleries in Sonoma county, the new bonds for which are now being issued by the revenue officers of this district.

THE Governor has appointed John T. Doyle of San Francisco a member of the Viticultural Commission, vice M. M. Estee, failed to qualify.

THE U. S. Fish Commission steamer Albatross has arrived in San Francisco. Investigation of Pacific Coast fishes will now be made.

THE total loss at the Goldendale, Or., fire Sunday, it is said, will reach \$200,000. Many families are left destitute, and are in need of assistance.

A. J. BRYANT, Ex-Mayor of San Francisco, fell from the Oakland ferryboat last week and was drowned. It was at first thought he had committed suicide, but a jury has decided that the death was the result of an accident.

A TREE that was cut down near Whatcom, W. T., yielded 35,000 feet of lumber, which at \$7.50 per thousand, makes the tree worth \$262. The Whatcom Reville says that timber lands in the county will average ten such trees to an acre.

W. J. PILCHER, one of the half-interest swindlers who defrauded the Oregon rancher F. M. Parker out of his estate, has been sentenced to one year in the county jail and to pay \$5000 as a fine. If this is not paid he will remain 15 years in jail.

NOTWITHSTANDING the alleged scarcity of water, the Boca Mill Company has just completed the most successful log drive that has been made by them for many years. The last log came down the Little Truckee river last Sunday evening, and the pond is estimated to contain nearly 6,000,000 feet of saw lumber.

THE El Dorado County Society will hold its 14th annual reunion at Placerville on May 25th. Placerville was known as Old Dry Diggins until September 25, 1849, when three murderers were lynched, and it was afterward called Hangtown. In January, 1850, the Legislature termed it Placerville.

ON Friday night of last week train robbers attacked the train at Agua Seres, a small town on the Sonora road, 12 miles south of Nogales. They killed the conductor and fireman, and badly wounded the express messenger and others. Two of the robbers have since been captured, and rewards have been offered for the others.

At the station of Fountain, Colorado, some freight cars which had broken loose from a train collided with a passenger train standing at the station. A car full of naphtha was ignited, and in turn 17,000 pounds of dynamite on another car were exploded. Five persons were killed and 25 injured. The damage to the town is \$60,000, and to the railroad company double that amount.

THE summer immigration from the canton of Ticino, Switzerland, direct for California, is now under full headway. During the past three or four weeks large numbers have arrived in this city. They are mostly young men and there is not a pauper immigrant among them. Upon arriving in this city the great majority depart for the interior to work in the dairies or on ranches.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

382,664.—HAY PRESS—E. Prengel, Oakland, Cal.

382,441.—WAD PRINTING MACHINE—Prentiss Selby, Oakland, Cal.

382,445.—REVOLVING SHOW CASE—C. H. Tully, Middletown, Cal.

382,575.—CABLE RAILWAYS—E. J. Weston, S. F.

15,439.—TRADEMARK—Merriman Manufacturing Co., Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

THE BUFFALO SAVERS.—A carrier-pigeon, bringing news from the buffalo-hunting expedition at the headwaters of the Canadian river in Texas, reached Garden City, Kansas, on the 14th. Two small herds of bison had been seen, and three or four calves lassoed.

THE VETERINARIAN.

Serious Swellings.

EDITORS PRESS:—Two of our cattle are afflicted with some disease, concerning which I wish you would ask your readers to contribute their observation and experience.

On a four-year-old bull, about a year ago, a large swelling commenced to form in the head of the neck back of the jaw and a little to one side, which assumed in time large proportions, getting to be of the size of a child's head. After I had made several applications of iodine, and repeated poulticing, the place which had been hard commenced to soften, and I finally lanced it, and after a short time the discharge of the matter contained in it took place, this being black, thick and of extremely offensive smell. The place healed up, and to my surprise, after a short time, commenced swelling again lower on the jaw; this latter place, after repeated treatment, bursting and discharging matter as at first. It occurred again for the third time, and now there is a calloused swelling left under the jaw which may swell again.

The second case is a three-year-old heifer affected in much the same way, excepting that now the diseased place appears to have become a permanent tumor, there being in the center of the place a continual discharge of the most offensive matter, with a large calloused tumor formation on each side of this place of discharge.

I was formerly of opinion that the cause of these places on both the bull and cow was the working in through the inner membrane of the throat of seeds of fox-tail or wild oats. Although I still think this may be the cause with the bull, I cannot accept the case of the cow in the same light.

The bull has always been in first-rate condition and he has evidently had no great pain, but has fed naturally and easily all the time. The cow, however, has fallen off very much in condition during the course of the disease, and now appears to suffer great pain.

I hope readers of the RURAL can shed some light on these cases. SUBSCRIBER.

(Original)

Books and Authors.

BY CALLIE BONNEY.

MEN, PLACES AND THINGS. By William Mathews, LL.D., author of "Getting On in the World," "The Great Conversers," "O atory and Orators," etc. Three hundred and ninety-four pages; \$1.50. Mailed, postpaid, on receipt of price by the publishers, J. C. Briggs & Co., Chicago. Contents: The Character of Napoleon I., William Wirt, Bulwer and Dumas, The Weaknesses of Great Men, The Greatness of London, The London Pulpit, The House of Commons, The Queen of Watering-Places, The Advantage of Ugliness, Worry, Courage, Oysters, Cynics and Cynicism, The Extremes of Dress, The Tricks of Types, Literary Quotation, The Value of Fame, and other essays.

The varied and interesting contents of this volume, bearing the evidence of much careful thought and research, will please many, while here and there a reader will find statements which challenge strongly his opposing thought. The ardent admirers of Napoleon, for example, will hardly take kindly the assertion "that he aggravated to a disease the traditional bias of the French nature to war, and therefore despotism; that he corrupted its morality by a successful course of spoliation; that he violently perverted education to serve the cause of tyranny, and converted religion into an engine of despotism," etc. Nor will the worshipers of Bulwer's wonderful powers accept the statement "that he was not a genius," "never reached the pinnacle of excellence and fame," "that as a novelist, on the whole he hardly ranks in the very first class, his verse lacking that mysterious something called poetry;" and that he possessed dramatic genius "only in a moderate degree." All this will meet, and justly, strong opposition.

The papers on "Worry and Courage" are to the point, and in the latter essay an amusing anecdote is told of the inborn courage of Nelson. That when a boy, having ramblled late one night, his mother said to him on his return: "She wondered fear did not drive him home." "Fear!" he replied; "Who's he? I don't know him."

In "Cynics and Cynicism" the author regards "Cynicism as one of the chief vices of our times," in which he is undoubtedly correct; and in "Literary Quotation" he considers "a man's style of expression should be as characteristic and inseparable from him as his clothes." But for further sentiment and opinion we must refer the reader to the author.

\$500,000

On Country Real Estate in large and small amounts at lowest rates, by A. Schuller, 106 Leidesdorff St., Room 3.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, if requested the following articles (while this notice continues), at the very greatly reduced figures named at the right:

- 1.—The Agricultural Features of California, by Prof. Hilgard, 138 large pages, illustrated, cloth, with colored maps (full price \$1).....\$0 25
- 2.—World's Cyclopedia, 794 pages, 1250 illustrations; (exceedingly valuable).....50
- 3.—Dewey's Patent Elastic Binder (cloth cover), name of this paper stamped in gilt.....50
- 4.—Niles' Stock and Poultry Book for Pacific Coast, pamphlet, 120 pages, illustrated.....25
- 5.—Kendall's Treatise on the Horse and Diseases, 89 pages, instructive illustrations.....05
- 6.—To New Subscribers, 12 select back Nos. of the RURAL PRESS, "good as new".....Free
- 7.—Any of Harper's, Frank Leslie's and most other first-class U. S. periodicals, 15 per ct. off regular rates.
- 8.—Pacific Coast and Eastern Dailies, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent off advertised retail rates.
- 9.—March of Empire, by Mallie Stafford.....25
- 10.—Life Among the Apaches, 322 pages, stiff cloth.....25
- 11.—\$1 worth of choice seeds, to be selected from a list of 107 flower and 82 garden seeds, as previously published, or which list we will send on application.....25
- 12.—Dewey's Pat. Newspaper Fileholder (18 to 36 in.).....25
- 13.—European Vines Described, 63 pages.....05
- 14.—Webster's Dictionary, 634 pages, with 1500 illustrations; very handy and reliable.....50
- 15.—Architecture Simplified, 60 pages.....05
- 16.—Mother Bickerdyke's Life with the Army; patriotic and ably written; 166 pp., cloth, \$1.00.....50
- 17.—Ropp's Easy Calculator, cloth, 80 pp.....25

- 25.—The Taxidermist's Manual; illustrated, 64 pp.....10
- 26.—Beautiful Poetic Review, entertaining and instructive; 35 pages (a handsome and pleasing present).....25

NOTE.—The cash must accompany all orders. Address this office, No. 252 Market St., S. F. Inform your neighbors about our offers and paper. In writing correspondence, items of information, or on other business, please use a separate sheet. Sample copies of this paper mailed free to persons thought likely to subscribe. Send for free circular describing most of these premiums, and any further information desired.

HOLLISTER'S FLORAL FAIR.—The ladies of Hollister held a highly successful floral fair in Well's opera-house, May 4th and 5th. Among the more noticeable features was the "Frigid Zone," a pavilion of snowballs, 10 feet square and high, roofed with a huge white floral umbrella, where young ladies dispensed ice-cream soda. On the table arranged by Mrs. N. C. Briggs the center-piece was a schooner, with mainsail set, made of snowballs and loaded with pansies. Its halcyards and stays were of smilax, and the vessel rested on a sea of moss and ferns. One of the most striking designs was the new courthouse, built (chiefly by Mrs. A. Leggett and Mrs. F. E. Dalzell) of white roses, with cornices of red roses, and the dome of marigolds. The structure was fully 10 feet high, and was illuminated from the interior, the light streaming cheerfully through the windows. About the courthouse were ample grounds, with graveled walks, lawns, fountains and statuary. The Advance states that, after paying expenses, there was left about \$150 for the Presbyterian church.

Injurious Insects of the Orchard, Vineyard, Field, Garden, Conservatory, etc.,

Remedies for their Extermination.

By MATTHEW COOKE.

Late Chief Executive Horticultural Officer of California. Illustrated with over 750 wood-cuts and 25 pages of classified illustrations. This book is designed for the use of orchardists, vineyardists, farmers and others interested in the subjects treated. It is designed to convey practical information concerning some of the species of insects injurious to the industries of cultivators of the soil, and those interested in earth produce generally. Price \$4, postpaid. For sale by DEWEY & Co., publishers, 220 Market St., San Francisco.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Carriages.

We are receiving 10 carloads of Carriages, Buggies and Wagons from the Briggs Carriage Company of Amesbury, Mass., which will be sold at prices that will be satisfactory, considering style and workmanship. Quality of material guaranteed the best.

F. A. BRIGGS & CO.,
220 & 222 Mission St., San Francisco, Cal.

KEMP'S DOUBLE CAM HAY PRESS is advertised in this issue of our paper. It has merits which others do not possess. Send for circulars.

The Best Drier

Does the best work with the least labor and with least expense for fuel. It has a single drying chamber in which the draft moves horizontally either way, alternately, lengthwise of the chamber. The hot-air draft is admitted into the chamber at the proper temperature, and in its passage as far as the middle it is reinforced, as fast as it tends to decline, by means of radiators within the drying chamber connected with the furnaces in the heating chamber. On reversing the draft at intervals the drying process is thoroughly equalized throughout the chamber, and no injury occurs to the first fruit or material with which the hot-air draft comes in contact. All the heat generated is utilized. It is charged by means of cars containing the material to be dried, which remain in the chamber during the process of drying. There are no sliding or swinging doors to the chamber. The cars are put in and withdrawn from the chamber without letting in a deluge of cold air, or in any manner interfering with the draft or drying process. The cars, no matter how large or heavily laden, are moved easily by one person. The largest sized drier of this kind, although having a capacity of 50 or 100 tons to the charge, and having a forced or exhaust wheel draft, can be reduced in a few minutes to the smallest sized fruit-drier having a natural draft and the heating facilities and quantity of fuel required for the lesser drier are also quickly and successfully reduced to the minimum. This drier is in no danger of burning, as the heating apparatus nowhere comes in contact with woodwork. The apparatus used is all well made and is durable, simple in construction and is easily understood and easily managed. It has no automatic or complicated gearing whatever, or other machinery of any kind except such as is required to run the exhaust wheel of the largest sized driers. The chamber has openings only on one side and all the work of changing the trays or material is done on one floor. It is adaptable to any kind of fuel that can be used for heating or making steam, and will dry anything that requires to be dried in any quantity and as quickly as it is desirable to have it done. It can be constructed on a large or small scale and will work as well on a small as on a large scale. It is especially adapted to raisin vineyards and fruit and hop ranches, large or small, as well as for companies, communities or colonies. A large one would answer for a tract of country several miles in extent. The cost of construction depends on the size and the purpose for which it is to be used. In a short time a more complete description of this drier, with illustrations, will be found in this paper. The proprietor of this drier designed and constructed the drier built for Miss Austin, in Fresno, in 1884, called the Mammoth drier, being the first successful raisin-drier ever constructed in the State.

Address A. J. Hatch, 120 Sutter street, S. F.

Consumption Surely Cured.

To the Editor:—Please inform your readers that I have a positive remedy for the above named disease. By its timely use, thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy FREE to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,

T. A. SLOCUM, M. C., 181 Pearl St., New York.

Buena Vista Rancho.

A portion of this Rancho, suitable for mixed farming or dairying, containing 1672 acres, will be offered for 30 days at \$35 an acre, one-third cash, balance in three years. Address J. C. HOAG, 312 Van Ness Avenue, San Francisco, or TYLER BEACH, San Jose.

THE BOSS SICKLE GRINDER

The Only Successful Sickle Grinder Ever Made!

Every Machine Warranted. There are more Boss Sickle Grinders sold every year than all others combined.

ONE MAN CAN GRIND A SICKLE easier and in less time than TWO by the OLD WAY, and every section will be ground to a TRUE BEVEL as when it came from the factory.

It costs but a trifle more than an ordinary Grindstone, with frame and hangings, and can be used for all purposes. Price, \$8. MANUFACTURED FOR

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, May 16, 1888.

The weather the past week has been of the best for grain crops, although a large portion of the land seeded has been so dried up that the crops died out, and consequently the land is being summer-fallowed. Fruits are ripening rapidly, and receipts are increasing. Vegetables are also coming in in larger quantities. The European and Eastern wheat markets have ruled strong throughout the week. The following is to-day's English cable:

LIVERPOOL, May 16.—Wheat—Quiet. California spot lots 6s 7½d to 6s 10½d; offcoast, 34s 6d; just shipped, 34s 9d; nearly due, 34s 6d; cargoes off coast, quiet; on passage, quiet but steady; Mark Lane wheat, firm; French country markets, firm; wheat on passage to Continent, 496,000 qrs; wheat and flour on passage to U. K., 2,261,000 qrs; wheat and flour in Paris, steady.

Foreign Review.

LONDON, May 14.—The *Mark Lane Express*, in its review of the British grain trade, says: The English wheat trade is slow and previous rates are difficult to sustain. Foreign wheat is quiet. In London prices have been maintained, but in Liverpool they are a fraction cheaper. Flour is cheaper. Corn in Liverpool is 1d dearer. Oats are in demand at an advance of 3d. Linseed is weak and prices have declined 6d. To-day there was a better demand for wheat, and both English and foreign rose 6d. Flour is 6d higher. Oats are 6d@1s higher.

Crop Prospects.

WASHINGTON, May 10.—The report of the Department of Agriculture says: Low temperature and deficient rainfall, with drying winds and some frost, have reduced the condition of the winter wheat in the Central States. On the Atlantic Coast the plant has nearly held its own. On the Pacific Coast only medium development is reported. In the Southern States the changes are slight. The report shows a decline of 4 points. The standing is: New York 16, Ohio 12, Michigan 12, Indiana 6, Illinois 7, Missouri 2, Kansas 3. The general average is reduced 9 points, from 82 to 73. Winter rye remains very nearly as in April, the average being 92.9, instead of 93.5. The condition of winter barley is 88.6, promising a medium crop. Spring seeding has not advanced as well as usual, cotton seeding being especially late.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York:

Day.	Cash.	May.	June.	July.	Aug.
Thursday.....	98½	97½	94½	96	94½
Friday.....	98½	97½	94½	96	94½
Saturday.....	102½	101½	98½	98	97½
Monday.....	102½	98½	98½	98½	98½
Tuesday.....	102½	98½	96½	96½	96½

The closing prices for wheat have been as follows, at Chicago:

Day.	Cash.	May.	June.	July.	Aug.
Thursday.....	84½	82½	83½	84½	83½
Friday.....	84½	82½	83½	84½	83½
Saturday.....	87½	84½	85½	86½	85½
Monday.....	87½	85½	85½	86½	85½
Tuesday.....	86½	86½	87½	88½	87½

CHICAGO, May 16.—Wheat—87½c for cash, 88c for June, 89c for July and 88½c for August. Corn —57½@57¾c for June.

NEW YORK, May 16.—Wheat—\$1.01½ for cash, 99c for May, 97c to 97½c for June, 97½@97¾c for July, 96½c for August and 96½@96¾c for September.

Wool.

NEW YORK, May 13.—Bradstreet's says of the wool market: Consumers throughout the country are restricting purchases even more loosely than usual to their current requirements. With the new clip coming in, caution is natural. Most of the mills are employed on orders for which material is required, and to this extent there is a demand for fiber. Speculative activity and purchasers for future consumption are entirely wanting. Small Texas and California wool or spring clip are beginning to arrive on the seaboard. In the former State staple is accumulating, buyers and sellers appearing for a part in their views. The season in California is late and there has been no buying. The general condition of California product is not so good as last year. According to the *Boston Journal of Commerce*, the prices now obtained for fine wools are the lowest in the history of the country, unless they were lower previous to 1824, from which date quotations are obtainable. Medium wool, however, has not shrunk so much as ruled since 1876. This grade has sold for better prices than fine wool. London sales closed firm, with choice selections ½@1d higher than at opening. A good attendance and active demand are reported from Antwerp sales now in progress, and prices are firm. The wool trade in Philadelphia continues dull and unsatisfactory. Manufacturers buy only for actual wants and apparently lack confidence as to the stability of values. The uncertainty as to the outcome of the tariff discussion in Congress unsettles the market and confuses calculations as to the course of prices on new wools. Dealers are consequently reluctant to operate in the country markets. Sales foot up a total of 4,830,000 lbs against 3,850,000 lbs last week, and 2,890,000 lbs for the corresponding week last year.

California Products at Chicago.

CHICAGO, May 12.—Oranges are a little steadier for the supply shows some decrease. Sales are within the following range: California bright fruit, 53@3.25 ¢ box; smutty, 3.25@2.50; smutty Navel, 54.

Ten-pound boxes of California cherries are selling well at 35.50 ¢ box.

California dried fruits are ruling steady, and no change is quoted. There is a moderate trade in a small way for all descriptions.

We quote: Apricots, sun-dried ½ lb., 10½c@11½c; bleached, prime do, 13c; do, choice, 14½c@15c; do, fancy, 15@16c; evaporated, choice to fancy, 14½@16c; peaches, sun-dried, ½ lb., 11@12c; do

evaporated, unpeeled, 13@15c; do peeled, 20@22c; plums unpitted, ½ lb., 6@9c; do pitted, 10½@11c; prunes, small, ½ lb. 6@7c; fancy large, 9@11c.

Raisins, loose Muscates, 2-crown, ½ box, \$1.35@1.45; do, 3-crown, ½ box, \$1.50@1.65; do, London Layers, ½ box, \$2.25@2.40.

Hops rule firm and there is a moderate business in choice grades. Pacific Coast, choice, 13@14c ½ lb.; common to prime, 9@12½c.

New California potatoes are selling at \$2@2.25 ½ sack, or about \$1 ½ bu.

Miscellaneous.

NEW YORK, May 14.—There are few Pacific Coast goods to handle at this season. New money is seeking a place, but I hear of no settled transactions. There is a moderate business in hides. California has a small showing in the sales. They bring 16c—a pretty full price. In hops, the only movement of account is in cheap grades. Raisins bring \$2.05 for the best 3-crown.

Local Markets.

The closing sales on the San Francisco Call Board were as follows:

Date.	Buyer Season.	Buyer Year.
Thursday.....	\$1.43	\$1.60
Friday.....	1.45	1.61
Saturday.....	1.46	1.63
Monday.....	1.47	1.62
Tuesday.....	1.44	1.62

Date.	Buyer Season.	Buyer Year.
Thursday.....	\$.89	\$1.07
Friday.....	.89	1.06
Saturday.....	.87	1.07
Monday.....	.85	1.06
Tuesday.....	.86	1.06

BAGS—The market is weak and depressed. The demand is almost nil for Calcuttas.

BARLEY—The local sample market has fluctuated considerably, being controlled by receipts and also by transactions on Call. Trading in futures have been active with lively fluctuations, as will be noted by the closing prices in another column. At to-day's Call sales prices were as follows:

Morning Session: Buyer season—100 tons, 89½c. Buyer 1888—100 tons, \$1.06½; 100, \$1.06½; 300, \$1.06½; 600, \$1.07 ¢ ctl. Afternoon Session: Buyer season—100 tons, 87½c; 200, 88c. Buyer 1888—300 tons, \$1.07½; 200, \$1.07½; 900, \$1.07½; 100, \$1.07½; 100, \$1.07½ per ctl.

BUTTER—The market continues to stiffen under a good demand from the trade and also packers. The impression gains ground that the season will be short.

CHEESE—The market is steadier, with a stronger tone noted. The demand is improving.

EGGS—Free receipts of Eastern are against this market. Strictly choice fresh laid are wanted at the expense of off qualities.

FLOUR—The market is very strong. Some millers ask another advance. If wheat continues up, prices for flour must advance.

WHEAT—Shippers are not doing anything—prices too high. Short sellers on Call and millers are the only buyers. The higher markets abroad caused many to buy actual wheat against their sales for future delivery. On Call transactions have been fair. At to-day's Call the sales reported were as follows:

Morning Session: Buyer 1888—400 tons, \$1.62½; 400, \$1.63; 600, \$1.63½; 100, \$1.63½; 100, \$1.63½ ¢ ctl. Afternoon Session: Buyer 1888—200 tons, \$1.64½; 1200, \$1.63½; 400, \$1.63½; 700, \$1.63½ ¢ ctl.

[COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco, from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 '86 to May 14 '87.	July 1 '87 to May 12 '88.
Flour, qr. sks.....	3,867,276	3,279,379

Cereals.

The *Mark Lane Express* of April 23d says: Changeable and showery weather has characterized the past week. Destructive thunderstorms have occurred in various parts of the country and the rainfall has been considerable. In the southeastern districts yesterday (Sunday), a cold rain from the east continued nearly the whole day, and though ungenial, has imparted welcome moisture to the soil. This morning in London shows no sign of improvement, but it is to be hoped a softer temperature will follow and be maintained. The ready condition of the land has enabled a large amount of seeding to be done, which in the earlier districts it has been far advanced, if not actually completed, so far as grain is concerned. The wheats are making progress, although not very rapid as yet, and the only com-

plaints of defective plant which we have heard are from light land districts. Unless the summer should be early and very forcing, there may yet be a favorable all-round result obtained from the harvest of 1888. Farmers have been too busy to attend to thrashing operations, and supplies of native grain of all descriptions have fallen off materially of late. Country markets have reported a firm trade for wheat, with 6d to 1s further advance in some instances. In London, sellers have held for some improvement, but it is doubtful if more than an occasional 6d has been actually paid.

H. Kains Jackson, in the *London Farmer*, says the weather has become spring like, and, though the political outlook is cloudy, the markets appear to have lost heart within the past few days. The forward offers of wheat are at prices well calculated to dishearten current trade. So far from the forward market inflating prices, it has, for the past two years, at least, been a very depressing influence. At the present moment new-crop wheat from the Argentine Republic is offered for shipment at 30s. 6d., and Chilean on passage at 33s., while samples of these sorts of wheat on spot are at about 32s. and 34s. respectively. Thus, grain to arrive during the early summer presses on grain already in hand, and grain to arrive during the later summer presses on grain to arrive in May and June. The reserves of Russian wheat are expected to be pushed forward in May. As low a price as 25s. has been accepted for wheat, which, as a feeding stuff for stock, outrivals the best maize, beans and peas, while excellent Russian wheat, fit for making good bread, is freely offered at 31s. per qr. The Indian new crop is offered at 23s. for fine white qualities, and 30s. for ordinary red wheat. These prices tend to keep the British wheat average between 30s. and 33s. At present it hugs the lower price much more closely than the higher level.

In France there has been a decided upward movement in wheat this week, most of the country markets quoting 50c to 75c per 100 kil. advance; the small offers from farmers, who are now busy in the fields, and the unfavorable crop prospects in America, added to the growing impression that the home crop will also be a short one this year, have combined to cause this improvement, and to determine farmers to hold for better prices.

The *New York Produce Exchange Reporter* says: The absence of any decided convictions among operators in futures, largely due to the false estimates of supplies of the last crop of wheat in farmers' hands, which so-called commercial papers have published from time to time very conspicuously, these very erroneous estimates have been extensively copied here and in Europe, the public have been misled, and instead of confidence and buoyancy, operators have been in doubt, which has been largely due to these assumptions, which are stupidly incorrect. Many of the large sales for May and June delivery have been made based on these erroneous assumptions of supplies in farmers' hands, and there is a large shortage for this month and June to be covered, and it is very plain this and Western speculative markets have been largely oversold; this would speedily show itself had we our usual export demand. The quantity of No. 2 red likely to reach us this and next month will be small, very conclusively showing that the wheat is not in the country, and that the last winter crop was about what we stated last October and November. With the exception of Ohio and Michigan no other winter wheat State has any surplus to spare, and farmers in these States with the unfavorable promise for the growing crop, will be slow to part with any wheat they may hold.

Advices regarding the wheat crop in Oregon and Washington are favorable, but the outlook will be all of 20 per cent less than that of 1887. In this State, previous bad crop reports are not only confirmed, but are, in some localities, claimed to be worse. There can be no doubt but the crop this year will not give California an exportable surplus of over 400,000 tons, and perhaps not over 375,000. The consumption in this State is increasing by reason of the growing population. The barley crop has not fared so badly as wheat, but still the crop will be all of 25 per cent less than last year, while the consumption is larger. There was not only a lessened acreage seeded, but many more fields have been cut for hay than were cut last year. The quantity of bright brewing barley will be less, but then Oregon will have more, as the weather in the barley-growing sections has been favorable to the production of bright grain. The oat crop in Oregon and Washington will be larger than last year, but in this State there will be very little difference. Eastern advices report a larger acreage seeded to both oats and barley this year.

In wheat the market held strong throughout the week, with sales of No. 1 white shipping made at a further advance. The demand comes chiefly from parties who have sold futures on Call. Many holders of the actual grain have sold against it on Call, generally "buyer." Receipts from the interior warehouses have been quite free, cleaning the stock held by the largest proportion, while depleting that held by the others. The shipping demand is only fair. The advance in prices abroad and the low charters ruling here being in favor of better prices. By reference to the tonnage in port and to arrive it will be seen that there is a decided increase in comparison with the like time in 1887, while the wheat crop prospects are poorer. Millers are meeting with considerable difficulty in having their wants met, owing to the scarcity of choice grades and also high views of holders. Oregon is sending us a lessened quantity.

From *Prime's Crop Bulletin* the following is obtained: The last half of April proved to be even more discouraging in the outlook for winter wheat than at any time on the whole crop, and what we were hoping and longing for, warm weather and copious rains, never came. My average of the winter wheat situation on the 1st of May, from over 600 points, in Illinois is 69, Ohio 71, Indiana 65, Michigan 77, Kansas 89, Missouri 80, Kentucky 70, Tennessee 85, with a general average of 76 per cent. Texas has planted her corn. So has Tennessee and Kentucky. Kansas has commenced. Plowing in Nebraska, but nothing done yet worth reporting in Indiana, Ohio, Illinois, Iowa or Nebraska. The recent advance in corn after a bitter fight to still further depreciate its value, plainly shows that those who thought the crop was not short have changed their opinions very decidedly.

The barley market has fluctuated some the past week, but held generally strong at full figures. Heavy receipts had at times a depressing influence, which

was taken advantage of by the bears to hammer prices down, but each break was quickly recovered, which shows the strength of the situation. The consumption is steadily increasing for both feed and brewing. The cold weather is against the latter going into consumption as largely as at this time in 1887. The stock of better grades of bright barley is not large, but off-colored is in liberal supply.

Oats have ruled weak throughout the week, with only moderate buying reported.

Corn has fluctuated some, but still the market exhibited throughout the week a fair degree of strength. Rye is moving more slowly, but the light supply keeps values from shading much. Buckwheat is lifeless.

Fruits.

Cherries are coming in more freely, but the demand keeps prices steady. It is generally claimed that a lower range of values will rule, with still heavier receipts. Apricots are coming in quite freely, but being Pringle's, canners cannot buy. Canners take strawberries at any price from \$3.50 down. Apples are slow, owing to the quality being poor. Canners expect to start up soon on both cherries and apricots. The suspension of J. Lusk & Co. is being taken advantage of by canners to depress the market for raw fruits by stating that large quantities under contract to that company will be thrown on the market. So far, the writer cannot obtain any positive information on the subject, but it is intimated that the fruits will all be cared for. Crop advices are without essential change. Fruits are ripening rapidly.

Dried fruits are moving very slowly. Buyers take only in small quantity. There is no local demand, owing to the market being supplied with raw. Quotations are nominal.

A sample parcel of Royal apricots was received the past week, as there was of cherry plums; both sold high.

Raisins are slow, but the stock is very light, particularly of choice grades. The prospects are of a promising character for a large yield of raisin grapes.

Feedstuff.

Ground feed has held firm, with a good demand. The character of the buying indicates consumers only taking in a hand-to-mouth way.

Hay holds strong. New is coming in more freely. As a rule the quality is better, the straw not being very coarse. The impression prevails that holders will press the market at an early day, when prices will go off, but will be speedily recovered with shipments held back. The market will be high throughout the season, owing to about no old held over, only a fair crop harvested and an increased consumption.

Live-Stock.

The market for dressed meat is quotable as follows by slaughterers to butchers (to get the price of stock on foot, take off one-third of the price for stall and grain-fed and one-half from the price of grass-fed, that is, animals running at large).

Bullocks and mutton sheep are pressing markets. The selling pressure is due to holders desiring to sell, owing to short pasture. Hogs, for the same season, are also lower and weak at the decline. Stock hogs are inquired for. Cows are slow. Small work horses are not wanted, but good sized find ready sale. For other kinds of horses the inquiry and prices are the same as heretofore reported.

HOGS—On foot, grain-fed, 6½c ½ lb.; dressed, 9½@9¾c ½ lb.; soft, 5½@6c ½ lb.; dressed, 8½@9c ½ lb. Stock hogs, 4@4½c ½ lb.

BEEF—Stall-fed, 7½@8½c ½ lb.; grass-fed, extra, 7½c ½ lb.; first quality, 7c ½ lb.; second quality, 6@— ½ lb.; third quality, 5@— ½ lb.

VEAL—Choice, 8@9c ½ lb.; fair to good, 7@8c ½ lb.

MUTTON—Wethers, 5½@6c ½ lb.; ewes, 5@5½c ½ lb.; lamb-spring, 7@8c ½ lb.

Hops.

The market exhibits more strength, but the absence of straight parcels of choice is against sellers. That line is irregular and only taken under protest. From the *Mark Lane Express* the following is obtained regarding the English markets:

BOROUGH.—Nearly all the hops that have been pressed for sale have been bought up, principally by consumers, consequently buyers find a difficulty in replacing hops that have been sold during the last fortnight (under positive orders to clear out) without paying a few shillings more money. Choice hops of every description are becoming exceedingly scarce, and the few that remain are held for more money.

WORCESTER.—We have no 1887 hops offering on our market by growers, and stocks in the hands of merchants are gradually being absorbed by orders coming in from consumers. There has been a large trade done during the last few weeks in 1885 and 1886 hops for consumption, and on speculation at the present low values, the general opinion being that hops of these dates, which are fine and in good condition, will pay the most money in the event of a failure in this year's crop, the present prices being unprecedented.

Vegetables.

In seasonable varieties, the market is well supplied. Receipts are increasing, and prices, except for peas, asparagus and beans, are receding. Canners are still taking peas and asparagus. The fine forcing weather will cause freer receipts and a still lower range of values in all varieties.

Onions are weak, under free receipts, and not being sufficiently matured to fill distant orders.

Potatoes are strong at full prices for the better varieties that are of good size, and will do to fill distant orders with. The crop in this State and Oregon will be larger than last year.

Cabbages are steady; a few are being shipped to distant points on orders received.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

1888.	1887.	
On the way.....	431,217	230,849
In port, disengaged.....	41,489	100,547
In port, engaged.....	10,361	7,818

Totals..... 483,067 339,214
To obtain the carrying capacity, add 60 per cent to the tonnage.

Tonnage on the way to Oregon, 15,077; tonnage at Portland, Oregon, loading and to load, 19,114. Total tonnage, 34,191.

Beans are inactive. Poultry, except good roosters, has been depressed, owing to heavy receipts from the Missouri river. Our

market appears to be controlled by shipments from that quarter.

Wool continues slow. Many growers are sending their clips to the East on consignment, where interest and other expenses are less. They believe that the depression is only temporary.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

HORTON & KENNEDY'S
FAMOUS

ENTERPRISE

Self-Regulating

WINDMILL

Is recognized as the
BEST.

Always gives satisfaction. SIMPLE, STRONG and DURABLE in all parts. Solid Wrought iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babbitted boxes.

Positively Self-Regulating,

With no coil springs, or springs of any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 6 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

HORTON & KENNEDY,

Booth's Sure Death Squirrel Poison

For Squirrels, Gophers, Birds, Mice, Etc.

Endorsed by the Grange and Farmers wherever used.

The Cheapest and Best.

Put up in 1-pound, 5-pound, and 5-gallon Tins.
Every Can Warranted.This Poison has been on the market less than two years, yet in
this short time it has gained a reputation of "Sure Death,"
equalled by none. By its merits alone, with very little advertis-
ing, it is now used extensively all over the Pacific Coast, as well
as in Australia and New Zealand.

BOOTH & LATIMER, San Luis Obispo, Cal.

Special Terms on Quantities in Bulk.

Patented Jan. 23d, 1883.

For Sale by all Wholesale and Retail Dealers.

The Ertel VICTOR
AUTOMATIC FOLDER,

THE LEADING BALER IN THE MARKET.

PROTECTED BY 44 PATENTED CLAIMS.

Double-Acting Perpetual Hay and Straw Press.

A Machine imitated but not equalled. Baling Hay or Straw faster, more compact,
easier, more economically (to load 10 to 15 tons to the Car) than is done with any other
so warranted or no sale. Circulars mailed free address, Geo. Ertel & Co., Quincy, Ill.N. B.—The above Victor Baling Machine, making 16x22 size of variable length bales, is
warranted to bale from 12 to 20 tons of Hay per day; loading from 10 to 15 tons to the railroad
box car. Price low and satisfaction guaranteed. Represented and sold this season by Messrs.
THAYER & PETERS, San Bernardino; N. MATHEWS, Los Angeles; BAKER & HAMILTON, San
Francisco; and by GEO. ERTEL, the manufacturer, at Livermore, Cal.

HAY PRESSES!

THE HURRICANE—Size A.

A mounted, horizontal double-ender. Size of bale,
when in the press, 17x22 40 inches. Average weight of
bale, 220 pounds. Capacity, from 16 to 25 tons per day.
Uses 4 men and works with 2 horses. Requires no
TRAMPING. Puts 10 tons or over in a box car.

Price.....\$1000.

THE HURRICANE—Size B.

Size of bale in press, 22x24x46 inches. Average
weight of bale, 260 pounds. Capacity, from 20 to 35
tons per day. Uses 5 men and works with 1 or 2 horses,
at option of baler. Requires no TRAMPING. Uses rope
or wire. Puts from 7 to 8 tons in box in a box car.

Price.....\$1000.

The SELF-TRAMPING JUNIOR MONARCH

Size of bale in press, 22x24x46 inches. Average
weight of bales, 260 pounds. Capacity, from 15 to 25
tons per day. Uses 3 or 4 men, at option of baler.
Works with 1 or 2 horses. Uses rope or wire. Does its
OWN TRAMPING. Puts from 7 to 8 tons in a box car.

Price.....\$500.

THE MONARCH.

Same principle as Junior Monarch, only smaller and
heavier. Size of bale, when in press, 17x20x40 inches.
Average weight of bale, 220 pounds. Capacity, from 12
to 20 tons per day. Requires 3 men and 2 horses. Uses
wire only—rope will not hold. Does its own TRAMP-
ING. Puts 10 tons or over in a box car.

Price.....\$600

THE GENUINE PRICE PETALUMA.

Size of bale in press, 24x24x50 inches. Average
weight of bale, 250 pounds. Capacity, from 10 to 18
tons per day. Requires 4 men and 2 horses. Uses rope
or wire. Hay has to be tramped into the press. Puts
from 5 to 6 1/2 tons in a box car.

Price.....\$350.

THE IMPROVED EAGLE.

Size of bale in press, 26x26x50 inches. Average
weight of bale, 235 pounds. Capacity, from 10 to 15
tons per day. Requires 4 men and 2 horses. Uses rope
or wire. Hay must be tramped in the press. Puts from
4 1/2 to 5 1/2 tons in a box car.

Price.....\$250.

The above is the finest line of Baling Presses in the
United States. They are nearly double the capacity of
those of other makers.For large, illustrated Catalogue of the same, ad-

INGERSOLL'S HAND PRESS.**DEDERICK'S TOP-FEED REVERSIBLE LEVER PERPETUAL PRESS**

During many years' experience in the sale of presses, we are fully convinced that the INGERSOLL PRESSES will be found to have overcome the great objections heretofore existing against hand power presses. They combine a quick, convenient, and effectual working power, and everything liable to break has been done away with. With a double ratchet wheel combined with a chain pulley and loose sheaves, a TWO, THREE, or FOUR FOLD lifting chain power is obtained, which, when acted on by only ONE PERSON with a light lever of only 5 or 6 feet long, will exert a force on a bale reducing it to SMALLER dimensions than has heretofore been accomplished.

No. 1.—Size of Bale, 46x25x24; Weight of Bale, 200 pounds; Weight of Press, 850 pounds; Price, \$125.

No. 2.—Size of Bale, 49x27x28; Weight of Bale, 300 pounds; Weight of Press, 1500 pounds; Price, \$175.

IMPROVED FOR 1888.

Price of Reversible Power Perpetual Press (17x22, Variable Length. Mounted on Truck, Weight, 4700 pounds), \$450.

These Presses may be operated by either one or two horses, and they press two sections to each half-turn and reverse of the horse, which is twice as fast as any other Press, operating half-turn and reverse; with all other Presses the horse must turn about to draw the power back, besides having to stop to bind and remove the bale, whereas our Reversible is our Patent Continuous Press without stopping to bind or remove the bale, and the power is reversed by the reaction of the pressed material, which method is secured to us by patent, hence the movement of the horse either way presses a section of a bale. Reversing the horse requires a driver, but gives satisfaction. The Press is otherwise the Perpetual or Continuous Press, with open feed orifice, screen bottom and all improvements. By a late improvement we have doubled the power of this Press; one horse will now do the work on it that two will do on Presses made in 1881, and we have also adapted and added our Patent Condensing Hopper, by means of which it may be fed with much greater ease and rapidity, as it is hard and disagreeable work to feed hay in its loose state into any Press without the aid of our Condensing Hopper.

"ECLIPSE" HAY STACKERS AND LOADERS AND "ACME" RAKES,

MANUFACTURED UNDER THE "ACME" AND OLIVER PATENTS

—BY—

**Byron
Jackson**

SAN FRANCISCO,
CAL.

Jackson's Improved "Eclipse" Stacker and Loader. \$100.

With the rakes the hay is taken from the swath, when cured, just as left by the mower, or from the cock or windrow, if it is desired to rake it before it is cured sufficiently to stack; and when the Rake is loaded it is driven to the Stacker, the rake-teeth entering between the pitcher-teeth; the hay is pressed forward against the pitcher-head, the horses then back the Rake off, leaving the hay in a compact mass upon the pitcher, and return to the field for another load. As soon as the Rake is out of the way, the horse attached to the pitcher rope is started, elevating the load the desired height, when the latch-rope is pulled, and the hay is dropped in the center of the stack, the horse is backed up, the pitcher being brought back to the ground by its own weight, ready for another load.

I have adopted the "ECLIPSE" as my standard Stacker and Loader. I mount it on wheels, which are not shown in the picture. It builds stacks 30 feet high, and the load may be "tripped" at any point, after the horse is started, varying with height of stack, or of load on wagon. This feature is peculiar to the "ECLIPSE," and of great importance, enabling the farmer to stack hay in the windiest weather, as it does not carry all the hay up over itself, regardless of height of stack, but dumps it just where wanted, and the hay, while being elevated, is held so that the wind cannot scatter it.

It is light, yet strong enough to lift the heaviest rake load; easily and quickly moved; requires but one stake.
Weight, 1500 pounds. Price, \$100.

WRITE FOR CATALOGUE.

Jackson's Improved "No. 3" "Acme" Rake and Buck Combined. \$50.

Does the work of all other Hay or Horse Rakes, viz., wire rakes, sulky rakes, revolving rakes, buck rakes and "go-devils." It rakes from the swath, and leaves the hay in large bunches at once, requiring no hand-work. One man and two horses will keep up with two mowers, following the mower as soon as the hay is wilted enough to be raked clean with any rake. It rakes clean. The hay will cure quicker without bleaching by dew or sun. Very large bunches can be made by pushing two or more rakes into one.

If raked and bunched by my Improved "Acme" Rake, the hay is in very much better shape to reload and deliver on the Stacker evenly and level (loading the rakes all they will carry to the stack), and spreads well over the stack, saving labor in stacking, because it has not been tangled, as it is when gathered with the sulky or revolving rake. It also saves waste of leaves and seeds, and gathers the hay clean of trash, such as old stubble, stalks and lumps of dirt. Bear in mind that wind-rowing hay with any rake is labor thrown away, and is detrimental to the neat and most economical working of the "ECLIPSE" Hay Harvesting Machinery.

These rakes, as offered for this season, are an improvement over all others. They have HIGH WHEELS (34-inch), with WIDE TIRES (4-inch) (not shown in the cut), and the patented ratchet-lever device, which enables the driver to EASILY raise the heaviest load.

Weight, 650 pounds. Price, \$50.

Secretary of Agriculture.

In the U. S. House of Representatives, May 21st, Hatch of Missouri, from the Committee on Agriculture, moved that the rules be suspended and the bill passed to enlarge the powers and duties of the Department of Agriculture, and to create an executive department to be known as the Department of Agriculture. After a brief discussion the motion to suspend the rules and pass the bill was agreed to—ayes, 233, noes, 13. It creates an executive department to be known as the Department of Agriculture, under the supervision and control of the Secretary of Agriculture, and provides for the appointment of a First Assistant Secretary of Agriculture. It also transfers the weather service of the United States Signal Office Bureau from the War Department to the Department of Agriculture.

The elevation of the Department of Agriculture to a leading place and giving its chief officer a place in the cabinet of the President has been long asked for by the Grange Order and other organizations. Opposed to this is the idea, which was advanced by Prof. Hilgard a few years ago, that it should rather be elevated into a position like that of the Coast and Geodetic Survey, or other learned institutions of the Government, and should thus be freed from change and disturbance, which is likely to follow a change in administration at Washington. Col. Colman, the present Commissioner, in his address before the National Grange last fall took ground in favor of lifting the Department of Agriculture above political control. The passage of the bill by the House of Representatives, as noted above, shows that the political elevation of the Department is the more popular proceeding.

THE NEWCASTLE APRICOT.—We have received a sample of this new California seedling apricot from its originators, C. M. Silva & Son of Newcastle, Placer county. We gave an engraving and description of the Newcastle in the RURAL of November 26, 1887. The fruit received justifies all we said of the fruit from samples sent us last summer. We would especially emphasize the rich flavor of the variety, which we conceive to be one of its chief values, notably so when considered in connection with its earliness. Silva & Son write us that they picked soft-ripe Newcastles on May 11th, which was quite as early as the Pringle with them. As for

size, they report it good as the Royals growing near by. The tree so far shows great health and vigor and freedom from gum disease, and its regular bearing hitherto is emphasized by the fact that it has a full crop this

year, when every other variety in the neighborhood is more or less of a failure. The Newcastle has been tested in distant shipment and has carried perfectly. Silva & Son report that they sold all the year old trees they had last winter.

the fleeting population of the valley. Our Eastern tourists and teachers who have gazed in awe upon the sublimity of Niagara, should not fail to visit Yosemite—not to do so would be the play of Hamlet with Hamlet left out.

In the Yosemite.

As the outing season rolls around, the thought naturally turns to the Yosemite, which still holds its place as the greatest single piece of natural scenery in California. It is true that as railways extend and multiply new masterworks of natural forces are made accessible, and our vacationists are scattered over a greater area, but there are always enough tending toward the great valley to fill its hostleries during the open season. The new State hotel, the Stoneman house, is also an attraction as well as a convenience, and this large structure, with the added improvements in the way of roads, trails, bridges, etc., are an inducement to revisit the valley. Recent publications in text and picture concerning the glaciers and lofty peaks of the high Sierra back of the valley will also have an effect to make the venturesome dissatisfied with the old charms and lead them to farther explorations. In all these ways the Yosemite becomes ever new.

The central figure of this group of wonders is of course the great Yosemite Fall itself; a view of which is given in the engraving on this page. The upper one is 1700 feet, and the lower one 400, with the distance of half a mile, and a descent of 626 feet in a series of small cascades, which are not visible from the valley between them. The falls are made by Yosemite creek, which is fed by the melting snow on the southern slope of Mt. Hoffman, two miles away. The stream is usually 30 feet wide and 10 feet deep, with a speed of a mile an hour, about the middle of June; but its size is variable, depending upon the stock of snow and quantity of heat. A hot day, when the snow is abundant, makes a very perceptible difference in the volume of the cascade. It is the loftiest waterfall known on the face of the earth. It awes the beholder into silence. Gracefully awaying from side to side in rhythmical vibrations, swelling into grandeur in earlier spring, and shrinking into beauty under the ardency of summer heats, towering above all the cataracts, calmly abides this undisputed Monarch of the World's Marvels.

The coming of the 10,000 Eastern teachers to California this summer should largely increase

YOSEMITE FALLS—Photoplate Facsimile.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

From Northeastern Kern Into Inyo.

EDITORS PRESS:—The country along the south fork of Kern river is now in a most flourishing condition. What was a barren desert only a few years ago is now a most delightful valley studded with farms and ranches with their herds of cattle and stock. Ditches have been constructed everywhere, and in many cases there are as many as five of them running parallel, conveying water to land below. Fruits of all kinds flourish wherever planted and grass is abundant.

Near Weldon there is one field of not less than 1500 acres in extent, all in alfalfa, which gives three crops per year and keeps stock innumerable. This belongs to a Mr. Brown.

Continuing up the valley and through the pass we find amid the Sierras hundreds of thousands of acres of what is termed "desert land"—extending through Kern, San Bernardino and Inyo counties, and all lying below Owens lake—which is of the richest and most fertile description. All it requires to make it among the most valuable in the State is water. It will not be 10 years before this so-called "desert" will be dotted with homes, and instead of land being worth only \$1.50 per acre, it will readily bring \$30 to \$50 per acre. The problem can be easily and quickly solved by artesian wells.

At Little Lake a young man has settled and taken up 160 acres for a stock ranch. He has about 100 head of cattle which do well summer and winter. He is constantly making improvements and will shortly have up houses and barns, sufficient to make comfortable any who travel over the road.

At the foot of Owens lake, and 16 miles below the town of Keeler, is the ranch of P. Walker, showing what a little cultivation will do. Entering the garden we find roses, pansies, snow-balls, and various other flowers in perfection of bloom; while of fruit-trees there are apples, pears, cherries, plums, etc., all doing remarkably well. The old gentleman is also trying oranges, which he thinks will flourish.

Arizona Notes.

EDITORS PRESS:—Confidence that the fierce Apache is at last under control, is manifest by Eastern people coming to view the land for which he contended till the very last.

Salt River valley has come rapidly to the front since Geronimo found his abode on the promontory of Florida.

Salt river bids fair to again be under the control of the hand of man, and her waters, instead of rushing madly down to the gulf, be again restrained by reservoirs, canals and ditches, and cause cities and villages to again dot this valley, as they did in the day when Nineveh was in her glory, and Babylon builded her immense walls and engineered her immense aqueducts. Notwithstanding the people who formerly dwelt in this valley lived in a day when metals were unknown, we will yet have to learn of the footprints left on the sands of time of their skill as engineers and builders.

Our crops are good, universally. Haying began on many farms April 23. Several headers go to work on barley crops on Monday, May 14th. The first crop of alfalfa hay is in the stack.

By personal observation here and correspondence with my friends in Vacaville, Solano county, California, I propose to compare the ripening of the standard classes of the apricot as to date of maturing and size and quality, and other points of value pro and con for the benefit of the readers of the RURAL. I tried this task last year, but as I did not get evidence enough to warrant a conclusion, I postponed until another crop. This much I settled last season: Fruits of any kind have more sugar here than in California. I hope my conclusions on the apricot will not get such a troop of land agents firing into me as was my fate in 1873, when, through the columns of the RURAL, I wrote up Southern California as a semi-tropical region as compared with regions (protected nooks) north of San Francisco. I had no axe to grind then, neither have I now. I am ever a friend to the PACIFIC RURAL PRESS and of the rural people.

Tempe, Arizona.

GEO. KAY MILLER.

The Colorado and Gila Valleys.

EDITORS PRESS:—In view of the intense interest which almost every section of the Pacific Coast is attracting on account of the advantages which each district presents to settlers, a few facts regarding the Colorado and Gila valleys may prove readable to many of your patrons. A large portion of the above-named valleys lies in Yuma county, the Gila river intersecting with the Colorado at Yuma City and forming a large amount of rich and productive land in the vicinity. The Southern Pacific railroad crosses the Colorado at Yuma, and, extending eastward, follows the edge of Gila valley for a number of miles, but the car window view gives the traveler a very imperfect idea of the extent and character of the arable soil

along the river. The general character has been described, as for the most part, a deep, sedimentary soil of brownish, gray, sandy loam, resting, in most places, upon a clay subsoil at a depth of from 10 to 20 feet below the surface. The clay subsoil forms a hardpan which is impervious to water. These soils have been slowly formed by the decomposition of shales, sandstones, marls, limestones, etc., mixed with organic and vegetable matter, washed down by the mighty waters, and have been gradually deposited during the course of centuries.

This soil with the use of water is capable of producing a large variety of fruits and vegetables, and two crops of the same each year. All the cereals grow to perfection here. There is yet a large amount of good land in this region, subject to entry under the various land acts of the United States, and a still larger percent filed upon with title unperfected, much of which can be bought on reasonable terms from claimants. There is here the best opportunity that the writer knows of for men of moderate means to get a home where exist a combination of excellent soil, good water and plenty of it, mild and salubrious climate, good shipping facilities and a most prosperous outlook. Well water is obtained in these two valleys within a depth of from 10 to 20 feet. There is considerable wood suitable for fuel and other purposes. The principal varieties are cottonwood and mesquite. Besides the S. P. R. R. the Colorado river affords navigation for several hundred miles for eight months in the year. The steamer now plies monthly between here and the Needles, a distance of 280 miles.

A large number of enterprises are in progress to irrigate the various sections of the Gila valley, many of which have been just started this year. Most of the ditch companies sell water rights to the owners of land along their canals for a stipulated sum, and agree therein to supply water usually at from \$1.25 to \$2 per acre for each year.

An important advantage which the settler of this region has over that of almost any other section of the United States is the earliness of the maturity of crops. All kinds of fruits ripen at least a month in advance of the coast and southern counties of California, giving the producer a monopoly of the best markets, either east or west.

The Yuma Indians, of which there are about 600, have a reservation set off for them on the west or California side of the Colorado. They are a peaceable people, and are known to work quite well by spells when they can get the employment that they wish. It is said that it never gets too hot here for a Yuma, though the mercury for about three months of the year often ranges as high as 110° to 120° in the shade. However, a case of sunstroke is said to be a thing unknown to the oldest inhabitant. Usually a breeze springs up during the day, and this, taken together with the fact that the air is so dry and perspiration so free, accounts for the fact that the heat does not bear oppressively upon the animal kingdom.

The Government maintains a school here for Indian youths, which is under the management of the Roman Catholic church. One of the peculiar features of interest here is the old Government fort now abandoned by the troops and occupied by the Catholics for their Indian school. The territorial penitentiary is located here with over 100 inmates. The building is a substantial edifice. Yuma contains about 1000 population, a large per cent of whom are Mexicans.

There is much reason to predict a brilliant future for this locality, being situated at the junction of the two largest rivers in the southwest, along which may be found such vast tracts of arable lands, all of which must in the very nature of things soon be occupied by people whose products will demand an outlet by additional railways. The road already projected from this point to San Diego, and which will soon be constructed, will give an almost incalculable impetus to trade and the substantial improvement of the country.

T. B. L.

THE STOCK YARD.

Wild Cattle.

A strange breed of wild cattle is found in the high hills skirting the Umpqua valley. In the mountains, near Riddle and Rosebud, they are probably most plentiful, but they do not venture down in the valley much. They stay on the hills and get water from the living springs which rise there. For the most part they are concealed in the dense growth of oak and fir in these mountains. There is heavy underbrush, too, so that it is a hard matter to get them. They go in bands of six or eight usually, but at night a herd of 40 or 50 get together and lie down in the same yard—that is, they sleep in the same spot, which is usually secluded among the trees.

A band of wild cattle have been known to get together on a cleared place like this every night for a couple of years. When feeding there are always a few bulls to act as sentinels. While the cattle graze in bands of half a dozen or so, they are, nevertheless, close to other bands, so that at an alarm from any one of the bulls, which leisurely feed on higher ground, they all run away together. The cattle are of all colors, and wilder than deer. It is a hard matter to

get a shot at them, for the reason that their scent is so keen.

They can smell a man a long distance off. They got wild in 1853, when the old man Riddle and two or three others of the first settlers came to the valley. Their cow wandered off and could not be found. After two or three years all the pioneers had to do when they wanted beef was to rig out two or three pack animals and go up into the mountains. The cattle had to be killed on sight, the same as deer and bear, for they could no more be driven down than deer could. Once killed, they were quartered, packed on horses and carried down.

They have been hunted a good deal of late years, so that there are not as many as there used to be. A peculiarity about these cattle is that their eyes and horns are jet black. The retina, iris and the whole apple of the eye are one mass of black. You can't distinguish any difference in any part of it. The horns, too, while being black as ink, are long and sharp. Brought to bay, the Oregon wild cattle are wicked fighters.—Oregonian.

The Nevada Cattle.

A correspondent of the Reno Gazette, writing from Elko, gives the following interesting account of the condition of the cattle interest in Eastern Nevada:

April has always been considered a trying month upon stock, even if it be as pleasant as the past one has proved to be in this locality. Old cows that have reached from 12 to 14 years of age, and young heifers with their first calves reach, during this month of each year, a crisis of depletion of strength and vitality, and their loss is often great during the calving and early suckling period—say from the middle of March to the first of May. This period is also a critical one with other kinds of stock, particularly sheep, as it embraces the lambing period. So far as any information extends from inquiry and interviews with stockmen or from foremen of their several bands, I find that stock that has wintered south of the railroad in Southern Elko and Northern White Pine counties, taken as a whole, is satisfactory to the holders, all things being considered. The percentage of loss among small holders is much less than was anticipated the latter part of last winter, and for the very good reason that this class of stockmen seem to have been better prepared with hay and shelter, and were so situated as to be able to give their stock a personal supervision during the inclement season. I learn from inquiry that the greatest mortality during the present spring has been among the stock that were fed and sheltered up to the first and middle of March and then turned out to provide for themselves. The regular range stock seems to have passed through not only the winter but April and March in better condition and with less loss than those fed and sheltered to early spring. Experience of past few winters have clearly proven one fact, and that is, if you commence to feed your stock you must continue to do so through the entire winter and including the month of April, unless your locality be visited with a very early and favorable spring.

I am informed by the foreman of Scott & Co. that their several large bands in Southern Idaho and Northern Utah, with a bunch in Montana, have wintered well and passed through the spring ordeal in fine condition. Their loss among the several immense bands will hardly reach the usual average, and the crop of calves will be large. But the firm have not been so fortunate with a bunch of some 3000 head that have been wintered in the vicinity of their home ranch, some ten miles southeast from Halleck station, notwithstanding every care was taken and every precautionary means adopted in the way of feeding and sheltering all of the stock that seemed to need assistance. The foreman, M. L. Polk, and his able lieutenant, Mr. Griswold, with their crew of cowboys, were in their saddles almost night and day, including Sundays, riding over their range gathering up such stock as needed feed and care, yet the loss has been considerable over the average. The greatest mortality occurred during the latter part of March and during the month of April.

All stockmen of Eastern Nevada whose winter ranges are situated along the line of the Humboldt river (say from Deeth, Elko county, to Battle Mountain, Lander county) have experienced a greater death rate among their cattle than in any other portion of Eastern Nevada, which has been chiefly caused from two facts that existed in that locality and that does not exist in other sections of the State of the same altitude and latitude, namely, the thermometer fell from 12 to 15 degrees lower along the line of the river than among the neighboring rolling hills and plateaus, whose general heights above the river are from 300 to 500 feet, and in some instances 1000 feet or more. Another reason is the winter ranges along the river were pastured bare and in some places barren of anything like grass or vegetation by early fall, and hence great distress must follow such a condition of things, especially when the winter was so unusually severe. However, when you leave the river either north or southward you will find the weather several degrees milder and the ranges in better feed condition.

I am informed by Myers Brothers, of Ruby valley, that, notwithstanding they have fed more hay during the past winter and the pres-

ent spring, and have taken greater care of their stock, they will, nevertheless, sustain a heavy loss, the major portion of it occurring in March and April, for the reason they turned their cattle out in early March in consequence of their hay being exhausted.

John Wright and Colonel J. B. Moore, both heavy holders, will also lose heavily, both on the general winter range and among the large bunches retained at the home ranch and fed as long as their stock of hay lasted—you have not only to feed your stock through the entire winter, but as late as the middle of April or the first of May. When stockmen are prepared to do this their losses will be insignificant. The same state of facts is also true in a more or less degree to other stockmen in Ruby valley, including Thomas Short, who is a large holder of stock; Ira D. Wines, Fred. Butch; John Hawkins and Hardson & Son, in Newark valley, White Pine county; Mr. Conover and Mr. Sharp, with others in that valley who have large interests in stock.

Our sheep interest has fared little or no better throughout northern White Pine and southern Elko counties, excepting E. C. Hardy, who is one of the largest sheep-raisers in eastern Nevada, and has a finely situated range, hence his meager loss during the past winter and spring.

I am informed by Assemblyman Griswold, who resides in Ruby valley, that the cattle belonging to Griswold Brothers have done exceedingly well during the past winter and present spring, which is owing to the fact that they had sufficient hay to feed them up to about the first of May, but they are fearful that their loss of brood mares will be unprecedented. They turned out last fall upon their old winter range 103 mares in good condition, but up to the present time they have been unable to find but 50 head. They have scoured the range from one end to the other, as well as other neighboring localities, for the past month or more, and 50 is all they have been able to round up. They, however, still entertain hopes of finding more during the general round-up in June and July. The loss sustained thus far by these brothers is over 50 per cent, something unheard of in the history of stock-raising.

AGRICULTURAL SCIENCE.

Anti-Fungoid Prescriptions.

F. Lamson Scribner, vegetable pathologist of the U. S. Department of Agriculture has just prepared a circular concerning remedies to employ against fungoid diseases of plants, from which we condense as follows:

In applying the remedies we must consider the period and manner of the attack made by the parasite and the manner of action of the substance applied. Fungi living within the tissues of the host must be prevented from gaining an entrance to these tissues; fungi which live upon the surface of plants or having their bodies soon exposed through the breaking up of the epidermis, like the apple-scab fungi or the fungus of bird's-eye rot of grapes may be treated by curative methods. The compounds having sulphate of copper for a base are, so far as we know to-day, the best preventative remedies; sulphur, sulphur and lime, sulphide of potassium, hypsulphite of soda, are to be classed as curatives.

Destructive treatments are available between the periods of vegetation (winter season), and consist in destroying all infectious material and in washing the plants to be protected with strong caustic solutions, e. g., solutions of sulphate of iron or copper and sulphuric acid.

During the growing season the strength of the solution used is governed by the power of the green tissues to resist their action. In the early part of the season while the shoots and leaves are yet tender, weaker solutions than those which may safely be applied later in the season must be employed. There is great diversity of susceptibility to the caustic action of the remedies between different species of plants and even between different varieties of the same species. The conditions of the weather at the time the applications are made may be of importance in this connection. Sulphur alone, applied when the weather is very hot and the sun bright, may cause a burning of the foliage. The same is true of sulphatine and also of eau de ciste.

Explicit directions cannot be given for these cases. Much has yet to be learned by experiment, and each one must exercise judgment and govern himself by surrounding circumstances.

Avoid making the applications excessive; do not drench the plants with the fluids nor plaster them with the powders. With a suitable spraying apparatus, which projects a fine, mist-like spray, merely wet the plant surfaces, and employ bellows which will discharge the powder evenly and in such a manner that the plants may be enveloped in a cloud of dust, which, settling upon all parts, becomes just preceptible.

Liquids.

1. Simple solution of sulphate of copper.—Dissolve one pound of pure sulphate of copper in 25 gallons of water. For treatment of downy mildew and oidium of the vine. For treatment of downy mildew and black-rot of the grape.

2. Simple solution of sulphate of copper.—

Simple solution in water, 5 to 8 pounds to 10 gallons. For soaking grains previous to sowing to destroy the spores of smuts.

3. Copper mixture of Gironde, Bordeaux mixture—original formula.—Dissolve 16 pounds of sulphate of copper in 22 gallons of water; in another vessel slake 30 pounds of lime in 6 gallons of water. When the latter mixture has cooled it is slowly poured into the copper solution, care being taken to mix the fluids thoroughly by constant stirring. It is well to have this compound prepared some days before it is required for use. It should be well stirred before applying. Numerous modifications in the preparation of this compound have been suggested, chiefly for the purpose of reducing the amount of copper. A solution containing the ingredients in the following proportions has been recommended for general use: Sulphate of copper, 4 pounds; lime, 4 pounds; water, 22 gallons.

The copper is dissolved in 16 gallons of water, while the lime is slaked in 6 gallons. When cool the solutions are mixed as described above. For treatment of mildew. For downy mildew and black-rot of the grape. For blight and rot of the tomato and potato.

4. Eau Celeste, Audouard process.—Dissolve one pound of sulphate of copper in two gallons of hot water; when completely dissolved and the water has cooled, add 1½ pints of commercial ammonia (strength 22° Baume); when ready for use, dilute to 22 gallons. The concentrated liquid should be kept in a keg or some wooden, earthen or glass vessel. For downy mildew. For treatment of mildew and black rot of the grape. For treatment of mildew and anthracnose. For blight and rot of the tomato and potato. For apple scab.

5. Eau Celeste, modified formula.—Sulphate of copper, 2 pounds; carbonate of soda, 2½ pounds; ammonia (22° Baume), 1½ pints; water, 22 gallons. Dissolve the sulphate of copper in two gallons of hot water; in another vessel dissolve the carbonate of soda in a similar manner; mix the two solutions, and when all chemical reaction has ceased add the ammonia; then dilute to 22 gallons.

6. Solution of ammoniacal carbonate of copper.—Prepared as follows: In a vessel having a capacity of two quarts or more pour one quart of ammonia (strength 22° Baume), add 3 ounces carbonate of copper, stir rapidly for a moment and the carbonate of copper will dissolve in the ammonia, forming a very clear liquid. The concentrated liquid thus prepared may be kept indefinitely. For use, dilute to 22 gallons. For peronospora of the vine.

7. Sulphate of iron.—Simple solution in water 4 to 8 pounds to the gallon, to be used only as a wash. For anthracnose.

8. Chloride of iron.—According to *Nature* (vol. xxxvii) a very dilute solution of the above-named substance has been used with success in combating the coffee disease due to *Hemileia vastatrix*. This fungus is a member of the group *Uredineae* (rusts), and it is said that the chloride of iron not only cures the disease, but also prevents its recurrence. The solution is applied to the under surface of the leaves by means of a pulverizer or spraying apparatus. Its sticky nature causes it to adhere for two months.

9. Shawinski's sulphate of iron and sulphuric acid solution.—Sulphate of iron, 110 pounds; sulphuric acid (53°), 1½ pints; warm water, 22 gallons.

"In order to avoid sputtering it is necessary to be very careful in pouring the sulphuric acid upon the crystals of iron sulphate, and not to add the warm water until after this operation. Besides, it is best to use sulphuric acid of only 53° Baume, because it is less dangerous to handle. I am careful to use this mixture the same day and while warm, for when it becomes cold the sulphate of iron crystallizes and the solution has no longer the strength necessary in order to be efficacious."

10. Sulphide of potassium, liver of sulphur.—Simple solution in water, 1 to 1 ounce to the gallon. Dissolve the sulphate of copper in 2 gallons of hot water; in another vessel dissolve the carbonate of soda in a similar manner; mix the two solutions, and when all chemical reaction has ceased add the ammonia; then dilute to 22 gallons.

11. Solution of hyposulphite of soda.—Simple solution made by dissolving 1 pound of the soda in 10 gallons of water. Must be used as soon as prepared. For apple scab. For celery-leaf blight. For orange-leaf scab.

12. Liquid Grison. Eau Grison.—Prepared by boiling 3 pounds each of flowers of sulphur and lime in 6 gallons of water until reduced to 2 gallons; when settled pour off the clear liquid and bottle it. When used, mix 1 part of the clear liquid in 100 parts water. For mildew on grape vines. For powdery mildew of the vine.

13. Milk of lime.—Simple solution in water, 2 to 6 parts lime to 100 parts of water. For peronospora of the vine. For anthracnose.

14. Phenic acid. Carbolic acid.—Simple solution in water one-half pint to 10 gallons. For powdery mildew of the vine.

15. Phenic acid in solution diluted with soap-suds and glycerine.—Soap-suds, 10 gallons; glycerine, 1 pound; carbolic acid, one-half pint; mix thoroughly to form an emulsion. For orange-leaf scab.

Powders.

16. Sulphur.—For grape mildew. For powdery mildew of the vine.

17. Sulphur and lime.—A mixture of sulphur and lime in equal parts by weight. A treatment of anthracnose during the growing season.

18. Blight powder, Sulphated sulphur.—Prepared by thoroughly mixing from 3 to 8 pounds of anhydrous sulphate of copper with 90 to 100 pounds of flowers of sulphur. For simultaneous treatment of oidium and the downy mildew. For downy mildew of the vine. For tomato and potato blight and rot.

19. Sulphatine, the Esteve process.—Mix 2 pounds of anhydrous sulphate of copper with 20 pounds of flowers of sulphur and 2 pounds of air-slaked lime. The proportions may be varied. For the treatment of mildew. For the treatment of the downy mildew and black rot of the grape. For the treatment of the tomato and potato for blight and rot.

20. Shawinski's powder.—Mix 22 pounds of finely powdered sulphate of copper with 33 pounds of soot or alluvial earth and 165 pounds of coal dust. For simultaneous treatment of oidium and downy mildew of the vine. For treatment of mildew.

21. Sulfosteatite or cuprique steatite.—An exceedingly fine bluish powder composed of steatite or talc, and sulphate of copper, the proportion of the latter substance amounting to about ten per cent. Very easily applied; considered the most adherent of all the powders. For the treatment of mildew (*Peronospora*).

22. David's powder.—Dissolve 4 pounds of sulphate of copper in the least possible amount of hot water, and slake 16 pounds of lime with the smallest quantity of water required. When the copper solution and slaked lime are completely cooled, mix them together thoroughly; let the compound dry in the sun, crush and sift. Apply with a sulphuring blow furnished with an outside receptacle for the powder. The copper coming in contact with the leather will soon destroy it. For downy mildew. For downy mildew and black rot of the grape. For mildew and anthracnose.

23. Podechard's powder.—Air-slaked lime, 225 pounds; sulphate of copper, 45 pounds; flowers of sulphur, 20 pounds; ashes, 30 pounds. Dissolve the sulphate of copper in the water; when thoroughly dissolved, pour the solution upon the lime, which is surrounded by the ashes to keep the liquid from spreading; after 24 hours, add the sulphur, thoroughly mix the compound, ashes and all, and when dry, sift through a sieve with meshes of one-eighth of one inch. This preparation may be made several months before it is required for use. For the downy mildew of the vine. For the treatment of mildew and anthracnose.

HORTICULTURE.

The Philosophy and Value of Fine Tilth.

Gen. N. P. Chipman has prepared another letter for the *Red Bluff Sentinel*, which we reproduce as of the greatest importance to orchardists just at this time, owing to the short season's rainfall:

We are just entering the season for cultivation of our orchards. Any mistake now or failure to appreciate the importance of thorough cultivation may result in the loss of all previous labor and money, and may discourage future effort. I have devoted one number to this subject, but it is not possible to exaggerate its importance or inform ourselves too well of the reasons and necessity for thorough cultivation. I am led to renew the discussion because of requests sent me for a more full statement of the theory and reasons; and also because I have observed some published theories that, to my mind, are misleading. In the *Cottonwood Index* of April 12th, I find the following:

"Theory of Cultivation.

The true secret of the value of cultivation of the soil is to keep any crust from forming, either at or beneath the surface. The existence of this crust does not induce evaporation, but it prevents the soil from absorbing the moisture from the air. The crust acts as a non-conductor of moisture, the capillaries all being closed by the dirt having run together and hardened. Break the crust (or never let it form in better), and the ground acts as a sponge, absorbing, especially at night, an immense amount of moisture from the air by capillary attraction. So we find the true object and purpose of cultivation is to keep the pores of the ground open to catch the moisture from the atmosphere. If this is not done the moisture already in the ground gradually sinks but does not evaporate. The crust prevents evaporation, just the same as it prevents absorption, resisting alike the passage of moisture from beneath into the air, and the absorption, by the capillaries of the ground, of the moisture from the air. Therefore, keep the crust from forming in your orchards, vineyards and gardens, if you would keep plenty of moisture in the soil."

We all agree that the crust must be broken. It is, however, a familiar rule that where the reason of the rule ceases the rule itself may be dispensed with. If, therefore, as stated, the crust acts as a non-conductor of moisture, I should think the first thing to do would be to form the crust and carefully preserve it. But to meet this it is said that this non-conductor prevents moisture of the atmosphere from being conveyed to the earth below, and if this source of supply is shut off the moisture already in the ground sinks and the earth becomes dry. Suppose your ground has an impervious substratum of hardpan or cement or compact clay; how can your moisture sink, and if you are fortunate enough to have such ground and can get a crust formed on top, what prevents your

having a perfect reservoir for your roots that will become exhausted only by appropriation of moisture by the tree?

I had always supposed the thing we are after by cultivation is to reduce the conductivity of the soil to the minimum point, and that perfect tilth is that point. We mulch trees to secure a non-conductor of moisture and to hold what we have already in the ground. But how can you have a conductor of moisture from the outside that is not also a conductor of moisture from the inside? If it conducts down it must conduct upwards. If the reason is sound that we cultivate alone to arrest moisture from the atmosphere and convey it into the ground whence it will not pass off only downward by gravitation, then perhaps the theory may be sound, but this, unfortunately, is not true; our moisture mostly escapes in the form of vapor and goes up—not down—and this process of cultivation, to prepare for carrying moisture down must also act to return it at once to the surface and off by evaporation, and we would thus gain nothing if it were not for the law governing this matter, which I will soon state.

The error into which my friend has fallen lies in the reason given. The crust is not a non-conductor, but is in fact the very best of conductors, and it is largely because it is such a conductor that we break it up, although there are other reasons as will appear further on. If you would prove how good this conductor is, fill a tight box with earth and pour water on the earth and let a crust form.

If the theory I am combatting is sound in the illustration just put, the moisture would remain in the box indefinitely because it couldn't pass out. On the contrary, however, the moisture will pass off rapidly and your box of earth will soon be as dry as a bone. Now, if you had stirred the top of the earth in the box and kept the crust from forming, the moisture would have been retained a much longer time. Why do we cultivate irrigated land where we have abundance of water? It is to hold the moisture taken up by the earth, and also to allow the atmosphere to enter the pores of the earth. There is no doubt that moisture is absorbed by the cultivated soil, as the editor says. Besides, cultivated soil will not so readily absorb the heated rays of the sun as will the compact crust, and hence the sun's heat does not penetrate the earth so far, which is a great point. The further the sun's heat penetrates, the more the moisture is vaporized and passed off. Again, cultivation promotes capillary action and tends to bring the moisture from below to the tree and plant roots. It also arrests the passing off of the vaporized water, and thus retains it below the surface. Cultivation adds to the porosity of the soil and permits the circulation of the atmosphere among the particles of the earth, as we have seen, and thus aids plant life, for the atmosphere penetrating the cool earth by means of this condition of porosity, is condensed to some extent and drops its load of moisture much the same as we see it depositing globules of water on the outside of a glass of ice water.

The result of cultivation is manifold. It promotes the raising of moisture from beneath the cultivated surface; it adds to the porosity of the earth and admits the atmosphere; it adds moisture to the earth by condensation of the atmosphere in contact with the cool earth; it destroys to an extent the conductivity of the cultivated stratum, so that vapor does not so readily escape; it prevents the soil from becoming heated to any great depth, and thus avoids the desiccating effects of the sun's rays.

We would have the perfection of cultivation if we could plow only late in the afternoon and when the south wind blows and never during a north wind. The beneficial effects of the atmosphere to the soil are seen in our summer-fallow land sown to wheat. It is not alone the rest which the land receives, because if the same land rested unplowed and was then plowed and winter-sowed, it would not yield the crop it does when summer-fallow, and the reason is, that in the latter case the atmosphere mingles freely with the earth, and in the former it cannot; and the observant farmer will tell you, that his latest plowed summer fallow land yields the best, and this is because the early plowed is beaten down by spring rains and loses the benefit of atmospheric influences. All this shows the great value of cultivation.

Mr. A. T. Hatch of Suisun tells me that he was led by accident to discover how very important is constant and persistent cultivation. A part of his orchard was infested with morning glory, and he was told that only frequent plowings would kill it. He tried it and found two valuable results; first, he killed the morning glory, and, second, that part of his orchard produced the largest fruit and tree growth. That pestiferous little vine taught him the most important lesson he ever learned in horticulture.

I had written thus far, but not being entirely satisfied of my ground, and not being able to give a satisfactory reason for what I had observed to be true, I wrote to Prof. Hilgard, of the State University, and submitted to him the point under discussion. The reply I give in full, as it makes clear the whole matter, as he always does anything that comes from his pen; and I wish to make public acknowledgement of the service he has been to me personally, in pointing out the right way, and the service he is daily doing to the people of the coast.

"BERKELEY, April 19, 1888.

N. P. Chipman, *Red Bluff*: DEAR SIR:—In reply to yours of 16th inst., I would say that the idea you refer to—that a crust on top of the soil is a non-

conductor of moisture—is simply contrary to facts of the case. On the contrary, the crust, by dint of its smaller capillaries, takes violent possession of all the moisture within the reach of the surface in the loose soil beneath, and, being a good conductor of heat, evaporates that moisture and so depletes the soil very rapidly, just as a dry brick laid on a wet sponge drains the latter of its moisture, and, when heated, will let it go. The sponge, on the contrary, will not take up any moisture from ever so wet a brick, because the small capillaries of the latter will not yield the water to the coarse ones of the sponge.

Cultivation prevents evaporation because the loose soil is like a blanket, preventing conduction of heat downward, and, on account of the coarseness of its capillaries, of its moisture upward. The crust is like the sheet of horn that might be made by compressing a blanket under superheated steam—it conducts the sun's heat freely; but, unlike the sheet of horn, also sucks the moisture upward and allows it to be dissipated.

You will find this matter discussed in some of its bearings in my pamphlet on alkali soils, which I mail with this. Very truly yours,

E. W. HILGARD."

We find, then, that the true and scientific reason why we break up the crust is to enlarge the capillaries and thus destroy their power as conductors of moisture. The other advantages follow to which I have referred.

I wish to express my dissent to the practice of growing vegetables or grasses or small fruits, or, in short, anything among our young trees.

Every living vegetable growth, whether a weed or some useful plant, lives upon the moisture which should go to your trees, and, in proportion to the extent you consume this moisture by vegetable growth among your trees, in that proportion you deplete the soil of its moisture.

There are soils where this can be done to some extent without injury, and probably a small space might be used in most soils for annuals, but, unless there is a necessity for it, I would never do it.

I notice, also, some are plowing or cultivating near the tree but neglecting the space beyond. This is very unwise and will prove detrimental. You cannot have moist soil around the tree if the soil next to it is dry, because the moisture will be drawn laterally away from your tree into this dry earth, and thus your tree will suffer.

We have not had our usual rainfall; it behooves us to conserve what moisture we have, and this can only be done by frequent stirrings of the soil.

Frost Affects on Plants.

EDITORS PRESS:—The damages which the frost of January has inflicted on different trees and shrubs can now be accurately ascertained, and to give an idea how much cold various plants can stand, we shall state the injuries done at Quisisana, near Auburn.

The lowest temperature witnessed here on two mornings before 6 o'clock was 16° Fahrenheit or 9° Centigrade below freezing. The growths killed entirely were:

Small one-year-old orange trees (only a small percentage is sprouting out from below the bud); pepper tree, guava apple, date-palm (*Phoenix Canariensis*); small plants of *Ritchardia filifera* (California fan-palm); *Veronica imperialis*, *Diosma alba*, *Arancaria excelsa*. (The trunk killed but the plant sprouting out from the stock); *Grevillea robusta*; *Acacia decurrens*, *linifolia* and *melanoxydon*. (With these the sprouts are so exceedingly weak that it is doubtful if they ever will give a healthy tree); orange and lemon trees less than four feet high. (The new sprouts of the orange are already ten inches, while those of the lemon have hardly one inch). *Dracena stricta*, *Cordylus indivisa*; *Agave*, Century plant (small plants); *Metrosideros semper-florens* (bottle brush); *Hydrangea hortensis*; *Abutilon*; *Solanum jasminoides*; *Habrothamnus elegans*; *geranium*, banana (*Musa Ensete*); rubber tree (*Ficus macrophylla*) and heliotrope. The last three were protected by a cover of manure.

One-year-old wood frozen on the following: Oranges more than four feet high; olives less than three feet (Mission and Piccolini have suffered equally less than Nevadillo, which lost all leaves; at present, however, all are covered with green foliage, the new growth being as long as six inches); oleander, gum tree (*eucalyptus*) *Acacia dealbata*.

The following were slightly injured, part of the leaves killed: *Phoenix tenuis*; fan-palm (two years old); New Zealand flax; *Eucallonia baxterianum*; *Ligustrum Japoeicum*; *Berberis Darwinii*, myrtle.

The following were not injured at all: Olives over three years old, *Araucaria imbricata* and *Bidwellii*, *Magnolia*, *Bambusa*, *Pittosporum*, *Yucca*, *Chamaecyparis xcelsa* and *humilis*, *Acacia julibrissin*, *daphne*, *camellia*, etc.

Quisisana, May, 1888.

F. C.

POWER FROM ARTESIAN WELLS.—Heavy machinery is now run by artesian well-power in many parts of France, and the experience of the French shows that the deeper the well the greater the pressure and the higher the temperature. The famous Greenelle well, sunk to the depth of 1800 feet, and flowing daily some 500,000 gallons, has a pressure of 60 pounds to the square inch, the water being also so hot that it is used for heating the hospitals in the vicinity.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Interstate Commerce Law.

[By MORTIMER WHITEHEAD, Lect. N. G.]

It is now generally admitted that, more than all other causes combined, the farmers of the United States, in their organized capacity in the Grange, brought about the legislation, both State and National, that is commencing to hold in check the great railway corporations, in their abuse of the power conferred upon them by the people. First came the "Grange decisions" of the United States Supreme Court, and followed in the last Congress by the passage of the Interstate Commerce law that has now been on trial about a year. It takes intelligent united work on the part of the people to secure good laws, and it requires watchful care to keep the laws after they are passed. "Eternal vigilance" applies here. The victorious soldier must not sleep upon the field of honor, or his triumph may turn to final defeat. As has been fore-shadowed during all the 12 months of its trial, amendments to the Interstate Commerce law are now before Congress, and will soon be acted upon. Will they make the law better, or will they lessen its usefulness?

As far as we can at present judge, the amendments to the Interstate Commerce law seem to be in line with the spirit of the law itself, and to make it more rather than less effective. We will present them here; and as the original law itself was so generally discussed by Granges all over the country, it would seem right and proper that Patrons should carefully study these proposed amendments, seek to understand them thoroughly, and then act accordingly.

The Senate Committee on Interstate Commerce has completed, and Senator Cullom has introduced, the following series of amendments to the Interstate Commerce Act: These amendments require that the printed schedules of rates shall be kept "open to public inspection" and "accessible to the public;" that reduction to the published rates shall only be made after three days' public notice, instead of without previous notice, as at present, and that the provisions in regard to advances and reductions in rates shall apply to joint tariffs made by connecting roads, as well as to the tariffs made by individual roads. It is proposed to amend the criminal penalty section by making those convicted of violating the Act liable to imprisonment for not exceeding two years, in addition to the fine already provided for, or both fine and imprisonment, when the offense is an unlawful discrimination in rates for the transportation of passengers or property.

The committee proposes three provisions in regard to "underbidding." First, that the officers, agents or employees of a railroad, who, by means of false billing, false classification, false weighing or false report of weight, or by any other device or means, knowingly and willfully assist or willingly suffer or permit any person to obtain transportation at less than the established rates, shall be deemed guilty of a misdemeanor, and shall be subject to a fine of not exceeding \$5000, or imprisonment for not exceeding two years, or both.

The second is that any person, or the officer or agent of any corporation, who delivers property for transportation to any common carrier subject to the provisions of the Act, or for whom as consignor or consignee such carrier shall transport property, who shall knowingly and willfully by false billing, false classification, false weighing or false report of weight, or by any other device or means, whether with or without the consent or connivance of the railroad or its agents, obtain transportation for property at less than the established rates, shall be deemed guilty of fraud, which is declared to be a misdemeanor, and shall be subject to a fine of not exceeding \$5000, or imprisonment for not exceeding two years, or both.

The third provision makes subject to the same penalties any person who by the payment of money, etc., or by solicitation shall induce any railroad or any of its officers or agents to discriminate unjustly in his favor as against any other consignor or consignee in the transportation of property; and also makes such persons liable with such railroad in an action on the case to be brought by any consignor or consignee discriminated against, for all damages resulting therefrom.

The only other amendments of general interest proposed are: One to permit railroads to carry free destitute and homeless persons transported by charitable societies; and another to permit railroads to give reduced rates to municipal government for the transportation of indigent persons.

Anarchy and Dynamite.

The *American Magazine* for May contains a startling article entitled "My dream of Anarchy and Dynamite." The editor states that "the author is a well-known writer who stands very high in military, social and political circles, but whose name is withheld at his request." The article itself professes to be an expose of the plottings of the Anarchists, and the avowed object of its publication is to so arouse the public sentiment that has been lulled to sleep by the delusive absence of open demonstrations, that laws will immediately be enacted for the suppression of both anarchy and dynamite. The utter inadequacy of present statutes, and of the police and military preventive measures, is forcibly shown, and effectual remedies are presented.

The author declares that "new features must be added to the laws: First, the possession of a dynamite bomb by any unlicensed person must be *prima facie* evidence of an intent to commit murder; and unlimited powers of search for bombs must be accorded to the police. A bomb would not be used by a private citizen not engaged in blasting, for any purpose other than murder; and the law might rightfully conclude that the man who had one in his possession without license, had it in pursuance of an intent or conspiracy to murderously take human life. The penalty for conviction should be specific and extreme; no loopholes for jury nor judge should be left; the penalty should be specifically imprisonment for life, and, if it be possible, the intervention of pardoning power should be forever prohibited. Let these fiends know that the mere finding of a bomb, in house, shop or pocket, means perpetual imprisonment with no miscarriage of justice possible, and it will tide us over the danger temporarily. But this would not be a permanent safeguard. After a time, police vigilance must necessarily relax; and the danger would again suddenly confront us, the more effectively, from the fact of its having been driven to underground and hidden methods."

Oregon State Grange.

The 15th annual session of the Oregon State Grange convened at Salem, Tuesday, May 22d, Worthy Master R. P. Boise in the chair.

During the afternoon the Grange was addressed by Governor Penoyer and others. Mayor Murphy of Salem delivered the address of welcome to the members of the Grange.

The attendance is large, and an interesting session is anticipated.

Temescal Grange.

The Harvest Feast at Temescal Grange on Saturday, the 19th inst., was a very pleasant affair.

Bros. Perkins and Renwick and Sister Dewey were appointed a committee to confer with neighboring Granges with a view of having a Farmers' and Grangers' picnic on or about the 4th of July, and to arrange a program for the same in connection with other Granges.

ELECTION OF U. S. SENATORS.—The late Democratic Convention, at Los Angeles, declared itself in favor of the election of United States Senators by direct vote of the people of the several States, and urged the adoption of such an amendment to the Constitution of the United States as will accomplish that result. This backs up the Grange lead in this reform. So far so good. Now for the Republican party. Can they afford to do less?

THE painful duty falls upon us to chronicle the death of Sister M. J. Frisbie, wife of Past S. G. C., B. F. Frisbie. Sister Frisbie was a most pleasant and amiable lady, who had endeared herself to the hearts of all who knew her. The heartfelt sympathy of all Patrons will be extended to Bro. Frisbie in this, his hour of affliction.

THE SAN JOAQUIN COUNTY GRANGES' PICNIC at Lodi, on the 18th instant, drew a great multitude to Wardrobe's grove, where Hon. J. V. Webster delivered an excellent oration—published in full in this week's *Patron*. Music, recitations, baseball and dancing varied the pleasures of the occasion.

SEBASTOPOL GRANGE PICNIC.—The picnic given under the auspices of the Sebastopol Grange, P. of H., was largely attended, and proved one of the most enjoyable events of the season.

WATSONVILLE GRANGE will hold its picnic to-day at Porter's Grove, about one mile from the town of Watsonville. A general good time is expected.

Slickens.

Relative to the statement made by W. H. Lee that "fully one-half or more of the hydraulic mines now in operation are worked by Chinese, but the mines are generally owned by white men, who lease them for a certain amount of the gold taken out," the *Red Bluff Sentinel* asks:

"If this be true, and we have no reason to doubt it, why have not the bosses of the Anti-Coolie Leagues gone into the hydraulic mines, into the hydraulic mining camps, and waged war on those who subsidize Chinese and run hydraulic mines with Mongolian muscle and coin, in defiance of the laws of the State?"

Mr. Lee's statement may be relied upon as correct, and the *Sentinel's* inquiry is pertinent. It is more surprising, however, that the white miners, especially those engaged in drift and quartz workings, have not put a stop to this employment of Chinese to transgress the laws of the State and bring honest miners into reproach. Every form of mining to which there is no opposition on the part of the valley people is suffering from the illegal operation of the hydraulic miners. If public sentiment in the mountains were correctly reflected by the newspapers of that region, it would be found that there is general condemnation there of the continued violation of anti-debris injunctions. But the law-breakers seem to have instituted a reign of terror, and to have silenced the voice of the law-abiding majority.—*Marysville Appeal*.

LONG AND SHORT HAULS.—The Interstate Commerce Commission filed a decision last week in the case of Martin & Co. of Denver against the Southern Pacific Company and the Union Pacific Company. The chief question involved was that of a greater charge for the shorter haul from San Francisco to Denver than for the longer haul to Kansas City over the same line. The commission decided that no adequate ground now exists upon which a greater charge for the shorter haul to Denver than for that to Kansas City can be justified. But in view of the fact that an effort is being made in good faith by the various lines to re-adjust the tariff to meet the requirements of the law, no order will be issued in this case for 60 days.

THE GRANGERS' PICNIC AT HOCK FARM, on Tuesday, May 15th, was largely attended. Governor Waterman made an interesting little speech, and J. W. Breckenridge of Merced, delivered an eloquent address.

FRANKLIN GRANGE had a pleasant and profitable meeting Saturday, May 19th; conferred the Third and Fourth Degrees on two worthy sisters, and discussed a fine Harvest Feast.

Vacaville Fruit Notes.

EDITORS PRESS:—The weather has been very cool for some time past, with fog hanging about the hill-tops mornings, which is not common at this season of the year. Fruit ripens slowly. Cherry-picking is about done, the crop being very light. Hay is pretty nearly all out, has turned out very well and is selling at from \$7 to \$10 per ton in the shock.

Two carloads of apricots, mostly Thissell's seedlings, were shipped East from Winters last week. They were put up by Messrs. Brink, Thissell and Pleasant. These apricots are a very light crop this year, but are the largest ever raised here. Some raised by Mr. Brink weighed seven to the pound. They are put up much ripier than those heretofore sent East, especially those packed by Mr. Brink.

When Mr. Earle and Mr. Porter were buying fruit to ship East, there was always a strife between them to see which would get the first fruit in market, consequently a great deal of what they shipped was never fit to eat. This the fruit-growers acknowledged would be the case, but so long as the money was paid and the shipper took all the risk, they did not care. Now that they take the risk and the fruit sells on its merits, things are changed for the better, and fruit is put up in much better condition. Fruit picked when fully ripe, but before it begins to soften, will keep much longer, either in the packing-shed or shipped away, than that picked green.

There has been much anxiety among the fruit-growers as to what would be done in regard to the contract made with Mr. Mauser for apricots. Mr. Mauser was around last week and assured parties with whom contracts had been made that fruit would be received and paid for just as contracted for. He promises fairly and some are satisfied, while others are doubtful if affairs are all settled. It is said that the Lusk cannery has about 700 tons of apricots engaged in the State, and 400 or 500 tons are between Vacaville and Putah creek.

Much uneasiness is felt in regard to the supply of labor. The China company at Winters have notified parties that they will have to pay \$1.25 per day for Chinamen. Many say they will pay but \$1 per day. Several have tried Japanese, and think they are much better than Chinamen.

Vacaville, May 20th.

A PARTY of Idaho vigilantes captured four men driving a herd of stolen ponies in No Man's Land, and lynched the whole party.

THE VETERINARIAN.

Serious Swellings.

EDITORS PRESS:—The swellings, alluded to by subscriber in your last issue, as occurring on his four-year-old bull and three-year-old heifer, are either of a *scrofulous* or *actinomycetic* nature, which can only be determined upon by examination by a qualified veterinary surgeon. These tumors used to be described and known as "wens" or "olysers," and were considered as *scrofulous* tumors, but are now generally considered to be *actinomycosis*, which is produced by a vegetable fungus, the *actinomyces*. It is of recent discovery and has been found in man, ox and pig. *Actinomyces bovis* is the name applied to the fungus in the ox.

These growths are found in various parts of the body, especially affecting those parts which have lymphatic glands situated in them. They increase in size slowly as a rule, but may manifest a first acute stage, which changes to a phase of less activity.

Softening often occurs, but the inflammatory action is often not active enough to cause bursting of the abscess, whence it is called a cold abscess or tumor.

Treatment.

As a general rule, surgical extirpation of the tumor is absolutely necessary. We must cut down on the diseased parts and remove all that is possible. Then dress the internal part with a strong solution of carbolic acid. The edges of the wound must be closed by sutures (stitches).

Syringe it out once a day with the carbolic solution, and apply a blister on the external surface.

In bad cases the animal had better be fattened for the butcher.

A. E. BUZARD, M. R. C. V. S. L.,
No. 11 Seventh St., S. F.

From Southern Colusa.

EDITORS PRESS:—The present season is a hard one for Colusa county, the soil being generally of such a light nature that less than ten inches of rain leaves us short. The reverse is the case in a wet season, for, unless the ground is actually flooded and kept so for a long time, Colusa responds nobly. If one-third of the crop of 1884 is realized, we shall think ourselves well off. Of course there is good fallow grain, but even that is far from being up to the standard. In Sutter county, as you get toward Yuba City from Colusa, the grain improves, but I am told that it fails again toward the Sierra foothills. Spots that have been irrigated hereabout show the good effects of water by the grain standing at least a foot higher than that surrounding, and instead of having that blasted appearance which most of the grain has, it is green and filling well.

Some alfalfa fields are irrigated here by pumping from the river. The land has to be divided into half-acre checks and leveled, and have direct communication with the ditches to make it profitable to use the size of pump we have here—the 10-inch. Land so prepared, not too far from the pump, with ditches working satisfactorily, can be covered or flooded to the depth of ten inches, at the rate of an acre per hour, which makes alfalfa more profitable than grain where the water can be obtained.

The Democratic Convention in this county nominated to the Assembly, and that is equal to an election, Mr. A. H. Rose, a great reclamation man. He has spent more time and money on levees and attempts to reclaim land than any other man in Northern California. How good a legislator he will make remains to be seen.

Sycamore and the whole of Colusa county has lost in Mr. Howell Davis one of its most energetic and enterprising citizens. A pioneer and resident of this county for the past 30 years, he has been merchant, teamster, farmer and contractor during nearly the whole of that period; and in connection with Mr. Rose and on his own account has constructed many miles of levee. About his last business transaction was to purchase two sections of swamp land and then encircle and include them within his vast levee system. He was one of the contractors who constructed the debris dams on the Yuba and Feather rivers, and he did all the earth-moving that was done by teams on the Colusa & Lake railroad. He was at the time of his death, and for 15 years before, a member of Grand Island Grange.

The haying season is advancing. Many acres and but few tons will be out. Much grain is too short to cut even for hay. The harvest season will doubtless be early here, as many fields of barley and some of wheat will do to cut in a week or ten days. They are already white and yellow.

The hog disease of which I wrote you last fall has not appeared for certain as yet; but doubtless will as the warm season progresses. Precautionary preventive measures are in order. The canal movement is just now the all-absorbing topic—one down the plains and one along the west side of the river is the course.

E. G. MORTON, JR.

Sycamore, May 18, 1888.

A COMPANY of English capitalists have sent an expert ostrich-raiser from Africa to Nevada to look out a suitable place for establishing an ostrich farm.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

A JACK SOLD WELL.—Chico *Enterprise*, May 14: A few days since D. M. Hooper purchased two fine Kentucky jacks of a gentleman just from the East, paying for both animals the sum of \$900. On Saturday Mr. W. Finnell of Tehama was in this city, and seeing "Uncle Dad's" fine canary birds, took a fancy to one of them and paid \$750 for him. He was shipped to the Finnell ranch, and hereafter his musical voice will resound along the banks of Thomas' creek. "Uncle Dad" says it was a pretty fair bargain, but claims he has the best one left yet.

Contra Costa.

HAY CROP.—Martinez *Item*, May 16: The whole country from Bay Point for some distance above Antioch is one immense hay-field, and farmers, assisted by the dry cool weather, are virtually "making hay while the sun shines." As an instance of the return from this valuable crop, Frank McCabe, near the town, has already baled three tons to the acre from about 15 acres, and thinks he has over 300 acres that will average as well. His crop is estimated at 1000 tons of first-class hay. Other ranches are doing as well, and, at the present prices of the article, it is a question if a greater profit will not be realized from this crop than from a large grain yield at the present low price of grain. Less expense is incurred in harvesting the hay crop and a consequent greater profit realized.

Fresno.

PROMISING FIG ORCHARD.—Fresno *Expositor*, May 16: W. M. Williams came down from his fine fig orchard on Dry creek this morning bringing some specimen boughs from his young orchard. One small bough within a space of 10 inches carries 21 figs and another 15, which are about half grown, and measure 5½ inches in circumference. Mr. Williams states that on his 60-acre orchard there is any quantity of such boughs. One small tree that would cover a space of 12 feet square he estimates will yield 1500 pounds of fruit. They are all the white Adriatic variety.

Placer.

THE CHIEF OF CHERRY TREES.—Newcastle *News*, May 16: It is pretty generally known that the largest cherry tree in the State stands in the orchard of Mr. Robert Hector, near the town of Newcastle. The yield of this immense tree increases from year to year, and notwithstanding the short crop of cherries the present season, Mr. Hector assures us that this old father of the orchard will yield over 3000 pounds of cherries this year, which will fill more than 300 10-pound boxes. The cherries are of the Oxheart variety, and very fine.

CHERRY-PLUMS.—Record-Union: A correspondent from Newcastle says the first plums of the season were picked on the ranch of G. D. Kellogg at Newcastle on May 18th. They were of the cherry variety, and very highly colored.

Sacramento.

CANNIBAL DUCK.—Bee, May 17: Mrs. Parsons, who resides in the Eastern suburbs, essayed this spring to raise some chickens and ducks, but the young fowls were no sooner hatched out and able to get about than they would mysteriously disappear. It was thought that the depredations were being committed by cats or rats until a few days since an accident occurred which lifted from the felines and rodents the weight of suspicion and fixed the guilt where it belonged. Mrs. Parsons is the owner of some large Pekin ducks, and on the occasion referred to children who were playing in the yard saw an overgrown drake waddle up to a young duck, knock it over with a vicious peck, and then gulp the duckling down into his capacious maw as easily as a hungry longshoreman would dispose of a luscious bivalve. This explained the fate of the young ducks and chickens which had gone before, and the Pekin ducks have been put where they will cause no further slaughter of the innocents.

THE FOLSOM CANAL.—Ground was broken at Folsom the 16th for the great irrigating and manufacturing canal. About 20 prisoners were put to work clearing away for the immense dam to be constructed. It is expected that over 200 men will be engaged in the work by the first of next month and operations will be energetically pushed.

San Bernardino.

SAN BERNARDINO CANNERY.—Ontario *Record*, May 16: The cannery at San Bernardino is now an assured thing, over \$30,000 in stock having been taken. The company has been incorporated with the following directors: S. G. Bart, J. L. Grow, E. C. Seymour, R. F. Cunningham, John P. Clum, John Anderson, H. L. Drew, H. H. Linville and J. B. Goodlett. A call for 20 per cent of the capital stock has been issued, payable in 10 days.

MOORPARK APRICOTS.—Lugonia *Southern Californian*: Everybody, nearly, who has tried apricot growing, knows that the Moorpark, though a fine flavored and large fruit, has proven so shy a bearer that it has been discarded by nearly every one. But in conversation with M. Eason of Crafton the other day, the editor learned with surprise that that gentleman had had none of that trouble with this variety. His trees are in soil which is a mixture of the red land and gravel, and they bear

abundantly every season. Mr. Eason thinks that his system of pruning may have something to do with the fruitfulness of the trees. He never prunes in winter or spring, but defers that operation until summer. He is of the opinion that better results are thereby secured, and certainly this seems to be the case in the matter of the Moorpark apricots.

San Joaquin.

MONEY IN FRUIT-RAISING.—Stockton *Independent*: One of the largest and most successful fruit-growers on Roberts island is Joseph Hale, who has 180 acres under cultivation, from the product of which he has cleared over and above expenses, \$80,000 in the past 12 years. Mr. Hale is satisfied that with proper cultivation the sediment-soil of the island will produce as good results as have been produced in his orchard. The fruit-growers of Roberts island have a great advantage over those of other sections in that the fruit ripens and can be placed on the market very early in the season, thus enabling them to derive the benefits of first prices. This is especially true of pears of all varieties. Since Mr. Hale set out his pear trees, his net profits from the fruit have averaged \$300 an acre. He has netted in one year \$1800 off 1½ acres of Bartlett pears. He has between six and seven acres devoted to apricots, and last year netted \$1700 from the apricots shipped. On 4½ acres in peaches he netted in one year \$1400. His 180 acres of land planted in fruit, vegetables and wheat brought him in a yearly profit of \$6,660, or \$37 per acre.

Shasta.

FRUIT SUPPLANTING GRAIN.—Cottonwood *Index*, May 17: Through the kindness of C. E. Williams we were shown through the Oak Lawn farm, and saw some splendid evidences of the fertility of upland. He has wheat, rye, oats and barley that are of fine growth and will fill without more rain. We never saw finer heads of barley, and much of the wheat is good for an average of at least 20 bushels to the acre. But grain is no longer profitable, and it has been clearly proven that our upland is the best in the world for fruit and grapes. Mr. Williams' orchard and vineyard will testify to this. They are loaded with fruit and grapes and are making a fine growth. He will plant trees and vines extensively next winter.

Sonoma.

DRIERS AND CANNERS PREPARING.—Healdsburg *Enterprise*, May 16: As the fruit season comes on, work tending toward the completion of the Magnolia cannery is being pushed to its utmost. A fine new engine and boiler have just been placed in working order. Tables and cooking vats are being placed in position, preparatory to beginning work. The tinshop employs ten men who have already made up over 80,000 cans, making them at the rate of 5000 per day. Over 500,000 cans will be required for the season's run. The enterprising proprietor, T. S. Merchant, has already contracted for the cherry crop of several large orchards in this vicinity, paying from 4 to 6 cents per pound delivered at the cannery. He has made arrangements with the S. F. & N. P. R. R. to issue commutation tickets during the busy season, from Cloverdale and return each day, \$5 per month, and from Geyserville \$3 per month, thus insuring him help from abroad and from our own county. He proposes to pay the very best of wages, being governed by the S. F. rates. During the busy season from 250 to 300 hands will be required. The Russian River Evaporating Co. has bought of G. W. Chapman the entire interest in his fruit-drying and evaporating establishment in this city, also the Hotchkiss evaporator at Windsor. Both of these driers will be enlarged and remodeled on scientific principles, using all the modern improvements in the evaporating system. The company expects to be able to handle all the drying fruits of this section, and to enlarge as the growing fruit industry may demand.

PEACHES FREE FROM CURLED-LEAF.—Santa Rosa *Democrat*: At a special meeting of the Fruit and Grape-Growers' Association, held in the Court-house, Saturday, May 12th, Mr. Woolsey reported that he had found the Early Crawford and Lemon Cling somewhat affected with the curled-leaf this season, but not enough to be seriously detrimental to the growth of the trees. The Orange Cling, side by side with the Lemon Cling, were remarkably free from the disease. The Muir was also an exempt variety.

Tehama.

THE OSTRICH FARM.—Red Bluff *Sentinel*, May 19: Since Dr. Sketchley's second visit to Red Bluff, when he entered into a contract to purchase from Beers Guyre 2100 acres of land seven miles north of Red Bluff for \$30,000, for an ostrich farm, his actions have been closely watched. After this transaction he became at once an object of interest in both Southern and Northern California. The time he asked for in which to consummate the purchase and perfect arrangements for removing his ostriches from Los Angeles and establishing them on a farm in Tehama county—16 days—expired Saturday, and true to his arrangements the Doctor was on hand and matters were satisfactorily adjusted. He arrived here on the 3:30 train Saturday afternoon, and was hospitably received by our citizens. He is enthusiastic over his new home. He thinks the climate well adapted to ostrich farming, and that the propagation and raising of the birds will be profitable. Nine of the ostriches arrived Sunday evening on the freight train. They occupied one-half of a box car, while the other half was occupied by a

keeper and a lot of vegetables on which the ostriches fed. The birds are all young. Early this morning six of them were loaded on McCann's dray and taken to the farm. More birds will be shipped here from time to time, as the farm is put in condition to receive them.

ARMY WORMS AT VINA.—The vineyard at Vina, it is reported—in fact, the entire ranch—was recently invaded by the army worm, and desolation was spread on every hand. The vineyard escaped total destruction only by the prompt action of H. W. McIntyre, the superintendent. He had trenches dug before the army, by plowing a furrow and shoveling out the loose earth. The worms could not cross these, as they are not able to climb. Many of the trenches were filled level with worms, however. The loss is considerable.

Tulare.

IRRIGATION COMPANY.—Visalia *Times*, May 17: Articles of incorporation of the Frazier Valley Irrigation Co. were filed in the office of the County Clerk on Tuesday. The purposes for which it is formed are the construction of a canal from Tule river and the diversion of water therein from said river, and the using of the water so diverted for irrigation, milling, manufacturing and domestic purposes in this county. The principal place of business is Frazier Valley, and the capital stock is \$60,000. The directors named for the first year are H. M. White, John Tuohy, James A. Kincaid, B. M. Hotchkiss and L. L. Gill. Jas. A. Kincaid has been elected treasurer and J. E. Shuey secretary of the corporation.

Yuba.

WOOL PURCHASES.—Appeal, May 18: The Marysville Woolen Mill ceased purchasing wool for the present season yesterday, having taken about 1500 bales, equal to about 500,000 pounds. The average price paid was 16 cents. Their purchase this year is larger than that of last. The wool-growers of this district find the factory a decided advantage to them, as it always pays good prices and they can usually do better to sell here than at the bay.

WILD BLACKBERRIES.—Chinamen appeared on the streets with wild blackberries yesterday, which they had gathered on the Feather river banks north of here.

FIRES IN THE MOUNTAINS.—Several small forest fires have been reported from the mountain regions. Residents there are going to take precautions this year to see that they do not spread.

ARIZONA.

PINAL COUNTY NOTES.—Enterprise, May 12: The Papago Indians residing in the valleys below Casa Grande are raising good fields of grain this year without irrigation. They take advantage of the occasional rains to store water sufficient to supply small fields and usually secure fair crops. After the summer rains they plant corn, melons and beans, and raise enough for their own consumption. H. G. Ballou killed his 47th lynx, at his ranch ten miles below Florence, Saturday night. These predatory animals pass his place in their meanderings up and down the river, and occasionally one that carries to pay its respects to his chickens contributes its scalp to Mr. Ballou's trophies. The Montezuma Canal Co. has two ditching machines on the way to Florence, which will be used in constructing the canal. Mr. Laughlin says he will have the canal completed for a distance of over 20 miles from its head inside of four months. Farmers about Dudleyville are in the midst of their harvesting, and very heavy crops are being gathered. Help is quite scarce in that section.

APRICOTS AND BARLEY.—Editors Press:—The apricot known as Wood's Early—alias Pringle, appeared in Phoenix, ripe, May 1st, from a tree owned by Maj. Hancock. In Mesa City, same day, ripe apricots appeared. May 6th, many trees yielded their first picking, and on the 10th, Maj. Hancock's tree had ripened all its fruit, which was a fair crop of an eight-year-old tree. May 9th, the first load of new barley thrashed by a common thrashing machine of a volunteer crop, appeared on the market in Phoenix. Many headers went to work on barley fields, May 14th, in this valley. —GEO. KAY MILLER, Tempe, Arizona, May 21, 1888.

OREGON.

THE WOOL CLIP.—Portland *Cor. Chronicle*, May 20: Sheep-shearing is actively progressing in Eastern Oregon, and wool is already being hauled to points on the railroad. The clip being hauled to Arlington and The Dalles is in fair condition. The staple is better than last year, except from localities where the ranges are crowded. Umatilla and Snake river wools are average in appearance. Union and Baker counties show a heavier clip, owing to the introduction of better blood. Grant county wools are light, and on the whole the clip of Oregon may be considered five per cent heavier in shrinkage than last year, but wools classed as railroad wools by the trade are as much as 10 per cent heavier. There is no buying to speak of, except at Arlington, where Eastern speculators are operating to a small extent at full prices.

THE Senate Committee on Appropriations has adopted an item in the Indian Appropriation bill of \$25,000 for the construction of buildings for an Indian school at Carson City.

News in Brief.

GENERAL PHIL. SHERIDAN is seriously ill. A REPORT is to be made to the Secretary of War as to the probable cost of a breakwater at Santa Monica.

A SPEED-TRACK to cost \$35,000 is to be built in Golden Gate Park. The money has been subscribed by citizens of San Francisco.

THE cruiser Baltimore will be launched at Philadelphia on July 4th, and it is thought that Mrs. Cleveland will christen the vessel.

THE Napa Agricultural Association has purchased the Coombs tract, just northwest of the town, and will lay out a mile course thereon.

A PORTLAND fisherman landed a 27-pound Chinook salmon with a hook and line last Friday. It took him over half an hour to do it.

THE Board of Underwriters has lowered the rate of insurance in Fresno on account of additions to the fire extinguishing facilities of the place.

THE Marine Engineers have adopted a resolution to notify U. S. Inspectors where marine engineers are known to be habitually intemperate.

THE Boca Mill and Ice Co. are enlarging their dam so as to have the ice pond cover nearly one square mile. The improvements will cost \$40,000.

THE trustees of the town of Santa Monica are trying to keep campers from building tents on the beach. A test case has been made so as to carry it before the Superior Court.

W. F. BOARDMAN, the Contra Costa Water Company's engineer, says that Oakland uses more water per capita than any other city in the United States, in the proportion of about nine gallons to six.

J. O. BROWN, General Manager of the State Board of Trade, has been notified that Tulare county has taken steps to affiliate with the State Board, and that the local board at Hanford will shortly send an exhibit to the State Board rooms.

THE Kern county *Californian* says: Mr. W. B. Carr expects to cut and stack 100,000 tons of hay on his ranches in this vicinity this season. He has also some of the finest fields of wheat and barley that were ever grown in this State, the result of irrigation.

THE director of the Lick Observatory was notified by telegraph of the discovery of an asteroid by J. Palisa, at Vienna, May 16th. At eight hours one minute, Washington time, its position was R. A. 16 hours, 21 minutes 8 seconds; and Dec. south 21° 35' 12". Its motions were minus 56 seconds and 1 minute. Its magnitude was 12.

THE Sutter cannery, says the Marysville *Appeal*, has now 40 persons at work. The superintendent declares that 400,000 cans have been made, and that contracts have been entered into for enough apricots and peaches at two cents per pound to insure a successful run. He expects to handle at least 1000 tons of this fruit.

ALL the trout at the United States Breeding Station on the McCloud river have been turned loose into the public waters of the States. Besides the large trout which have so been disposed of a large number of young fish are being hatched, which, when they have arrived at the proper age, will also be released into the McCloud river or its tributaries.

Carnations Raised From Seed.

On Tuesday afternoon the expressman brought us a basket from the famous florist of Goleta, Joseph Sexton. The muslin carefully sewed over it could hardly keep in the delicious fragrance, which exhaled more and more as the wrappings were taken off, and the beautiful contents began to appear—double carnations, only two or three alike, nicely laid on moist cotton, and all enveloped in oiled paper, so they came out wonderfully fresh.

There were about a quarter-thousand of them, of perhaps a hundred varieties—white, pink, lemon, cherry, crimson, purple, ashes-of-roses—countless shades in endless combinations; some being almost wholly of one tint throughout, others daintily bordered, and yet others dotted and striped and mottled in divers fashions that defy description.

Deft feminine hands drew them gently from their traveling carriage, layer after layer, even to the sixth, and laid them in order on the counter in the business office, where they stayed awhile, delighting many with their loveliness, and thence were borne away in small bouquets to beautify and perfume a score of homes.

CORNERS CONTEMPLATED.—It is a queer commentary upon the proposition now before Congress to prohibit corners in food supplies, as recently noted in the *RURAL*, that on Tuesday the Chicago Board of Trade adopted an amendment abolishing the rule prohibiting corners by a large majority. "This action is significant," local papers say, "for the reason that corners in May corn have been among the possibilities, and a corner in July wheat might also occur without surprising anybody."

AGRICULTURAL DIRECTORS.—On the 21st instant Gov. Waterman appointed the following directors of the Sixth District Agricultural Association: J. W. Waters, Jr., San Bernardino; L. J. Rose, Jr., Ventura; K. D. Wise, J. W. Robinson, A. Workman, L. J. Rose, L. Lichtenberger, J. C. Newton, Los Angeles.

Decoration Day.

[Written for the RURAL PRESS by SARA C. G.]

Again in one beloved cause all hearts united,
We meet to celebrate this ever sacred day;
Asking not if those who slumber here had plighted
Their faith and service to the Blue or to the Gray;
We only know that here on Nature's kindly breast
Sons of America are lying in their peaceful rest.

As some fond mother, musing o'er the part
Beside the resting-places of her cheri-headed dead,
Says not: "This was the first and that the last
In my affection." Roses and blossoms sweet are
spread
With loving care o'er all; so our fair land to-day
Brings tribute of bright flowers alike to Blue
and Gray.

For each was brave and faithful to the cause
He ever had been tought to deem the right;
True patriots were they who knew no holier laws
Than those of the country; their sole guiding light.
Love of their native land, they, at her call
Gave to her gladly, their service, lives, their all.

Shall we be censors, then, and shall we dare
Decide that these were right, and those were
wrong?

Ah, no! we leave them now to Him whose care
Is over all, and while the wild bird's song
A requiem sweet will be, with flowers of May,
And garlands white, we cover Blue and Gray.
Silver City, Nevada.

A Homely Romance.

So the old lady's been tellin' you I might 'a'
been President if I hadn't wasted myself on a
farm, has she? Bless her, she can't no more
help that idee a-bein' in her head and a tellin'
of whenever she gets a chance, than I can help
whittlin' when I talk!

Want to know how I missed livin' in the
White House an' instead struck root on a down
East farm? Well, I don't mind if I do tell ye,
seein' the cows is milked, and the turkeys in,
and the old lady can't no ways think of another
chore for't least a minit and a half.

Never lived on a farm, did ye, with a real
smart and go-ahead wife? Well, you'd be
s'prised to see how many things sich a help-
meet could find to do after all was done.

But land! Keziah, she's got so uster midgin
me up and I've got so uster waitin' to be midged
thet it ed seem strange like if things wasn't
that way.

Ye see I ain't nigh so pudgicky as I uster be,
and things step along first rate and easy—reck-
on even the old notion of a brimstone hereafter
wouldn't scare me much now. I'd sorter say
to myself and Keziah, if we've got to be burnt
to cinders, we've either got to gin out some-
time, or be made tough enough to stand it.

But about my bein' President. I was young
in them days, and was considered good-looking,
bein' five foot seven in my stockin's and not
lackin' in conceit. Maybe you've found out
for yourself that folks value you pretty much
at your own figures, and to think you're some
pumpkins is the surest way to be some pump-
kins. It's strange, but mighty true. Now I
don't count for nigh so much as I did in them
days jest because I've sorter grown modest
and don't set myself forward. Heigho, if it wa'n't
for Keziah, I don't b'lieve I'd be any 'count at
all.

But when I had this good feelin' about my-
self I lived over there on a farm jest beyond
them hemlocks ye see to the north, and Keziah,
she lived here in the old house, which I may
add wa'n't nigh so smart and white as it is now.
Keziah was a beauty in them days, jest like a
peach that's all ready to drop off'n a tree; but
if you'll b'lieve me I didn't know it then. I
had to go away to learn it.

Ye see I had growed up with her and was so
uster takin' her soft eyes and gentle ways for
granted that I didn't think nothin' of 'em in
particular, or if I did I thought they was a
part of pretty much all girls and my due for
bein' a superior chap. I uster carry her to
singin' school and apple bees and meetin's, but
as for lovin' her, I didn't know what it meant.

I was ambitious, ye see, in them days, and
couldn't give no thought to love-makin' more'n
an evenin's fun. And Keziah, she seemed
never to think about it no more'n I did. She
was easy and gentle, but that was all.

Off and on I worked down to the village, and
kept a wantin' stronger and stronger to swing
out for myself, where there was lots o' noise
and excitement. Country ways begun to seem
dull and country folks no end slow. I got a
notion in my head that I was meant for a bigger
man than a farmer. I wanted to see the city.

Dear me! all boys jest comin' into whiskers
and neckties has the same feelin's. Sometimes
they recover and sometimes they don't—which
I take it was the case with Bonyparte. Now
if he only hadn't had a relapse he might 'a'
lived several years longer in comfort and happi-
ness.

I recovered, but I had 'em pretty bad and
needed some master bitter herbs before I got
well.

I took to findin' faults in the old folks as
had brought me into life and worked their poor,
tired hands into hard knots for my sake. I
actually begun to see that they eat with their
knives and didn't care whether they had a
napkin or not!

When I came to that state I thought it was
time I left. An' so one Sunday afternoon I
packed up my clo'se and told mother I was
goin' to New York.

I don't like to think about the way her
wrinkled faced looked when I told her—it
was sudden and unexpected, ye see, to her,
for I kept my feelin's pretty much to myself.
She didn't try to argy with me not to go—it
wa'n't that, but it was the way she said
"Good-by."

Father wa'n't so hard—he was a man, and
after givin' me some good advice the thing was
over.

Then I went to tell Keziah I was off. I
hadn't no sentiment about that. I only had a
feelin' that it oughter be done, and so I did
it. I came across her at the pasture bars a-
drin' home the cows.

"I'm off to New York to make my for-
tune," says I, gay and easy, "so wish me good
luck!"

She stood still like for a minit there in the
shadder of the maples, a-holdin' on to the post
and lookin' up as if she didn't understand.

"Aint you glad?" says I wonderin' why her
eyes made me feel so sorter uneasy.

"Why, yes," she makes answer in a hesitat-
ing way, "but aint it dretful sudden?"

"Maybe 'tis to some, but 'tain't to me. I've
been thinkin' of it these two months. I hev a
place in Jim Barker's uncles' store—and I'm
goin' to take it."

She took out the top bar slow like and patted
Brindle's head.

"What'll the old folks do?" she says, and
then I know partly why her eyes made me un-
easy. But I wouldn't own to her I knew—a slip
of a girl as had never been to the city in her
life and didn't know how a horse-car looked!

I spoke up loud and confident. "Oh, they'll
do all right! and besides, a man's first duty is
to himself. He's got ter make jest as much out
himself as he ken—and I'm goin' to begin."

I had heard that sentiment at a perlitical
meetin' and it had sounded first-rate, but some-
how here in the fields with them gray eyes
lookin' at me, it didn't seem to have the same
ring.

"Maybe your right, Is'el, maybe you're
right. I don't know much about sich things.
But anyway, I wish you 'luck,' an'—an'—
all happiness."

With that she turned and hurried up to the
house a-leavin' the cows starin' over the bars in
a perfect muddle o' 'magement. Dem fool that
I didn't see anything in that, but I didn't! I
druv the cows home myself, and then cut across
the fields to the village.

The next day I was in the city, a free and in-
dependent citizen, but somehow it wa'n't half
the satisfaction I expected it to be. Jim Bak-
er's uncle's store was one o' they sell things at
wholesale in, and my part o' the work was to
tumble 'round bags and boxes and sich things.
It wa'n't exactly what I'd looked for from
Jim's account, and I didn't relish it.

As the weeks went by I come to relish it
even less. The men I worked with was freer
and independent in their words than any-
thing else. Between dust and oaths I was
pretty nigh choked to death. And the noise at
night was worse'n a Methodist revival in full
swing. I couldn't deaden it down under the bed-
clothes, 'cause there wa'n't enough o' them, and
I couldn't groan out against it, 'cause the man
in the next room threw things at the wall if I
did. Boardin' house biscuits wa'n't even sec-
ond cousins to home-made biscuits, and boardin'
house girls—well, I got over my notion that all
girls was Keziahs in pretty short time.

I begun to think there wa'n't so much room
in cities as I had imagined. I come to hev
dreams o' rock pastures and maples and hem-
locks, and along o' them come Keziah's face,
sweet and still as it had looked that afternoon.

Owin' to dust and not relishin' my vittals, a
scratchy kind o' cough fastened onto me, and
some fever with it o' nights. I was lonesome,
I tell ye, and finally I couldn't stand it no
longer. I says to myself, "Maybe this is the
way presidents begin, and maybe if I kept on
and this cough didn't kill me, I'd come to be
one some day, but I'll be hanged if I'll take the
chances—I'm goin' home!"

It wa'n't much of a "See the conquerin' hero
comes" feelin' that I hed when I got out o' the
cars. I didn't feel nigh so big as I hed planned
to, when I went away, but I kalkulite the
President goin' to his inauguration wa'n't no
gladdern's I was to see them old hills again. I
was so glad I couldn't wait for no wagon to
carry me, but struck out across the fields on
foot. It was jest the pleasantest afternoon in
September I ever see. The trees had begun to
turn gold and crimson, and the bees was
growin' lazy, and the late flowers was smilin'
contented, and the clouds nestled off on the age
o' the fields as if there wa'n't no better place in
the whole world.

I didn't mind the soraggly bushes; I didn't
care a mite for the holes they tore in my
trousers. I just took clean satisfaction in
stummlin' over them and the hummocks. The
hills, too, was so easy I almost wished there
was more of 'em. It seemed as if the smell o'
them hemlocks down in our pasture was differ-

ent from all other kinds, and when I got to 'em
I slowed up to drink it in.

I hedn't thought o' Keziah—somehow I
wouldn't let myself. I had had a strange sort
o' setness against it. But now I was comin'
near where she lived and I couldn't hold back
no more. I begun to tremble and a dull sort o'
ache crept into my heart. I went to the
maples we'd stood under that day and looked
at the bars where I had seen her last, wonder-
in' if I'd ever stand there again with her—me a
fellow that had started out so loud and ended
up so limp.

It was most sundown, and I wondered if
she'd got the cows yet. Then as if in answer
to my question I heard a soft tinklin' and saw
her comin' over the edge o' the hill, lookin'
like a picture I'd once seen in the city. Her
dress caught against the bushes and her sun-
bonnet lay way back on her head, and her hair
strayed 'round her face like fine, soft silk.

Like a flash it come over me, the reason I
wouldn't think of her was because I loved her;
because I was wide awake and knew that I
wanted her and her only of all the women of
the world.

I waited like one waits for the benediction in
church, and as I watched the little figure mak-
in' its way down the hill, it come to me thet she
was the one of us who was "makin' the most
of herself." She was the brave one stayin' here
on the farm with the old folks; I was the coward
goin' off to the city. I took off my hat and
bowed my head. I couldn't look up any more,
and I was glad the clump o' maples hid me
from her. I couldn't speak to her with all
them selfish plans and ambitions left so little
way behind. I would wait.

Slowly she come driving Brindle and Pet and
Boss just as she'd done that other time when I
hadn't had no eyes to see. She let down the
bars and spoke gentle to each cow as it went
through, but after the last one had stumbled on
into the footpath, she rested her arm on the
post and looked off to where night was comin'
up slow in the east.

Her eyes was sad and her face was thinner
than it hed been. My heart ached and yet beat
for gladness at the same time. Maybe—maybe
—and then I sort o' lost the grip o' the reins.
I forgot I'd been selfish, I forgot I'd been blind,
I forgot I'd failed, I forgot everything except
that I loved Keziah.

"Ziah, dear," I says, husky, "I've come
back for you."

She started with a little cry, for I frightened
her steppin' out so sudden, but in a minit drew
herself up and away as only a woman can.

"I don't understand. I aint a city girl—
you went away to be a great man. I—I—don't
understand."

There I stood up full before her in my torn,
dusty clo'se and grimy face.

"I aint a great man," I says, glad o' the
chance to be ashamed. "I aint a great man
or even a brave one, and I never will be. But
I love you true and honest!"

She looked up at me for a long minit and
then under the shadder o' them maples, without
a question, she took me as I was for better or
worse.

The birds on the treetops and the butterflies
on the flowers, and the bees in their hives
wa'n't nigh so happy as we was there by the
pasture bars, knowin' little and carin' less
whether the cows was in the barn or not.

And that's how I missed bein' President.
Not very near, you think, but 'bout as near as
a quarter on 'em get as run, I reckon, and a
big sight nigher'n the other quarter that lays
out piles o' money to get there.

Ze-ziah, she thinks if I'd kept on I might 'a'
been there—and maybe I might; but bless me,
it orter be time for her to hev something for me
to do—guess I'll go and look her up.—H. G.
Duryee in Port and Transcript.

Light.

[Written for the RURAL PRESS by C. P. NETTLETON.]

The thought of faith sufficed to perfect sight,
When He who keenly looked read happy trust;
No less shall now Himself bring joyous light,
If faith will ask from swe' contributions dust.

MERCIFUL TO HIS BEAST.—A pathetic scene
of kindness to animals was noticed in New
York, rather singularly, on the day of the
death of Henry Bergh. A big dray horse had
fallen from exertion. The driver did not flay
him and urge him to get up—he was evidently
a man of human feelings—but instead of doing
so, placed the harness as comfortably as possi-
ble, unhitched the truck and drew it away, and
then placed the collar under the beast's head as
a pillow and protection from the snow, covered
him not only with a blanket but the overcoat
from his own back. Did the dumb animal ap-
preciate such kindness? Any one would have
admitted that the horse was grateful, for he
raised his head and licked his master's hand,
as a dog would have done, and grunted in a
seeming effort to murmur his gratitude.—Ex.

"ARE YOU THE HORSE EDITOR?" inquired
an innocent looking young woman, approaching
the desk of that functionary. "I have that
pleasure, Miss," he replied, taking off his hat.
"Can you answer all sorts of questions about
horses?" "Well, I rather think I can," he
said, with a prideful swell in his bosom. "Oh,
I'm so glad," she twittered. "Will you tell
me the difference between a bay horse and a
sea horse?" As she went out of the office she
smiled back at him, but he sat gloomingly at
his desk and said nothing.

My Baby.

[Written for the RURAL PRESS by MAUDE S. PRABLER.]

Dear little eyes that look so clearly into mine,
With never a thought behind their shine,
God might not know.
Dear little hands that softly grasp and cling;
Dear little ears that listen when I sing—
Why do I love you so?

Dear little curls that cluster round your head,
Dear little voice that ne'er a word has said,
Stay on my breast.
Dear little feet that soon from me must stray,
Here is thy warmest welcome night or day—
Home is the best.

Dear little soul in God's own image made,
Dear little frame sometime in dust to fade;
The Lord will spare thee many happy years,
Despite thy mother's foolish fears.

Country Homes Should be More Beautiful.

The ensuing article from the *Oregonian* would
be quite as good were "California" substi-
tuted for "Oregon" wherever the latter word
occurs:

A farmer from this region who went East
a year or so ago came back satisfied that Ore-
gon is the best country on earth, but determined
to make his farm look more like farms he saw
in Iowa and Illinois. There they work hard,
and early and late, yet for all that their farms
struck him as wearing an appearance much im-
proved over the usual run of farms in Oregon.
There are some tidy and even beautiful farm
homes here, but the majority of Oregon farms
do not present so attractive an appearance as
all homes should have.

A farmer would be surprised to find in any
town or village that claimed public notice, any
home possessing so little adornment, or even
neatness and comfort of appearance, as his
own home would display if it was trans-
ported suddenly from the country to the
town. He seems tacitly to consider that
towns are to have a monopoly of all beauty
and culture, even the beauty of vegetation
and the culture given by the plow and hoe. He
actually rules himself to a lower order of civili-
zation and enters a protest against being classed
as a lover of beauty or a grower of anything at-
tractive. The town resident hires man and
team, wagon and plow, to do the work required
to beautify home for him, and keeps men delv-
ing and digging to realize what the farmer can
do himself or by his team and hired man. The
odds seem against town improvement, and in
favor of country life and homes; but the farm
team must plow the fields, and can not lose an
hour to beautify the farmer's home. The man
who helps is needed in the field, and cannot till
the garden as it should be done to command
success.

This presentation is forcible and strong, and
unfortunately it is abundantly true. If the
farmer had a son or daughter who were married
and living in town, and saw their home neg-
lected, it is more than likely he would offer to
send the team and teamster in to help improve
the city home. Why cannot he see the need of
such improvement for himself, and make the
acre or two surrounding his country home vie
in beauty and charm of cultivation and plant
life with beautiful homes everywhere? There
are generally wife and children to tend the
home spot and make it beautiful, and there
seems no excuse for the neglect so commonly
realized of farmers' homes lacking grace and
comfort.

EDUCATION AND POPULATION IN JAPAN.—The
people of Japan are greatly interested in the
education and elevation of women. In 1887
there were 128 new schools and societies for
girls and women established in that country.
These are in addition to the public schools,
which have long existed. Considering the
density of population in Japan, the small
number of populous towns is very striking.
Only five have a population exceeding 100,000,
namely: Tokio, 900,900; Osaka, 313,890;
Kioto, 255,400; Nagoya, 126,900; and Kana-
gawa, 104,320. Six only have a population be-
tween 50,000 and 100,000. This peculiarity in
distribution is due to the circumstance that
Japan is not an industrial, but an agricultural,
country. At the date of the last census there
were 8898 Japanese abroad, of whom 4356 were
in Corea, 2068 in China and 817 in America.

HOW TO HAVE ROSES IN WINTER.—The fol-
lowing is an extract from "Arabian Society in
the Middle Ages," by E. W. Lane, page 163,
and is given to our readers for what it may
prove, on trial, to be worth. "Some persons
preserve roses during the whole of the year in
the following manner: They take a number of
rosebuds and fill with them a new earthen jar,
and after closing its mouth with mud, so as to
render it impervious to the air, bury it in the
earth. Whenever they want a few roses, they
take out some of these buds, which they find
unaltered, sprinkle a little water upon them
and leave them for a short time in the air,
when they open and appear as if just gathered."

FUMIGATION is said to have originated with
Acon, a physician of Agrigentum, who is said
to have first caused great fires to be lighted and
aromatics to be thrown into them to purify the
air, and thus to have stopped the plague at
Athens and other places in Greece about 573
B. C.

Stage-struck Women.

There are no doubt hundreds of girls in this and other cities who have a great hankering for the stage. There seems to be just now a craze for this profession, and almost every day we hear of a stage-struck maiden leaving home to try a theatrical career. The success of Mrs. Langtry and Mrs. Potter has quite likely had much to do in turning their heads. In the blaze of such triumphs, home-life becomes humdrum, the drudgery of the shop, store or school irksome, and the atmosphere behind the footlights alone is fascinating. Where else is so much money to be made, to say nothing of fame, brilliant dresses, seeing one's name in the papers and one's face in all the show windows. Are there not Clara Morris and Ellen Terry and Modjeska and many others who make hundreds of dollars a night and are the idols of the public?

Of course it is true there are scores of poor girls in the stock company, the traveling troupes, the dime museum contingent, who are glad to act for just enough to find food and clothing, and who are never mentioned in the press or show-bills. But our stage-struck young lady just turns up her pretty nose at the thought of these.

And so it happens that the glamour of the footlights and such successes as those of Mrs. Langtry and Mrs. Potter have spoiled lots of nice girls who would have honored a good home and made happy wives and mothers. It is not impossible they might make good wives and mothers and go on the stage, but the history of the theater does not encourage the thought. It is only the successes of the theaters, not its failures, we hear of; but the successful actresses may all be counted on the fingers of one hand. The profession pays well those who succeed, but there is certain to be ninety-nine failures out of every hundred, and then there is no mode of life so full of hard work, disappointments, discomforts and humiliation.

Then to be a leading actress, as the phrase now goes, one must not only be familiar with the principal female roles of the great plays, able to give their full and true meaning, but such a course of life implies the possession of a costly wardrobe, the maintenance of a splendid establishment and a wide acquaintance with the leading managers throughout the country. This is something the majority of American girls do not possess, and however brilliant their talents cannot hope to attain without years of toil and disappointment. Then they should remember that the public is fickle and is fond of new faces and soon tire of the old ones, no matter how pretty they are.

But this is not the worst feature of the case; no career unsexes a woman so soon and so hopelessly as this cruel and drudging mode of life. She must travel from year to year and encounter all sorts and conditions of people. If all the old stock actresses would tell the story of their career it would wipe out in total eclipse all the triumphs of such actresses as Mrs. Langtry and Mrs. Potter. It is a life of hard study, bitter disappointments, insults open or covert, thankless neglect and premature old age.

MOTHERS-IN-LAW have been the butts of irreverent jests by scalawag sons-in-law since the world began. But the very boldness with which the latter have slandered them is the best evidence of the amiability of the one and the cowardice of the other. Were mothers-in-law such viragos as run-away or braggart sons-in-law claim, the latter would not venture to open their mouths against them. It is because they are amiable, gentle and good that so many men dare to swagger and sneer at them. All the world feels a kindly interest in the German Emperor. He is a true and manly man, and the best evidence of it was his gladness to meet his mother-in-law.

THE American hog is the terror of the world. John Bull started the cry, for he loves beef better than bacon; and since then several foreign Governments have prohibited the importation of swine products. But as the prohibition does not cover bologna sausages, a semi-production of the hog, our people may complacently enjoy the market that is made for our canine products. What is lost by the aggressive character of the American hog may be made up in the docility and adaptability of the American dog.

"THAT BLARSTED BANANA PEEL."

YOUNG HOLKS' COLUMN.

"This Little Pig."

It is not the little pig who only went to market, and let another little pig stay at home, and still another eat all the roast beef. You have heard all about those five pigs ever since your pink toes were first counted, as you count baby's now. The one real little pig this true story is about was smart enough to do all five things herself. And this is how it happened:

We four, and no more, went to ride one day. On the way home, who do you think had come into the buggy, to make five for Fanny to draw? It was this little pig, then hardly larger than your pussy. She had two black spots on her round white body, but you would not have seen them if you had been riding with her. How she did squeal when the man tried to tie her kicking little legs! So she was first wrapped in an old shawl, that the cords might not hurt her. Dressed in this way, and riding in a buggy, she looked so much like the picture in your book that we all said, "This little pig went to market."

Though her new home was as nice as a pen could be, the little pig did not like it at all. Where were her mother and her brother and sisters? "I will go and see," said Piggy. She made a very small hole a little larger and crept through. Away over the hill, behind the hay stacks, she trotted, with her little white tail in the air. She was soon out of sight in the tall prairie grass, but I heard her say quite plainly: "Kwee, kwee, kwee, kwee! I think I can find my way home."

But she could not. I could have told her so myself if she would have stopped to listen. For Piggy's first buggy ride had been three miles long. However, experience is the surest teacher, even for little pigs.

When it had grown quite dark between the haystacks, I heard a tired little voice say sadly: "Kwee, kwee, kwee! I never can find my way home."

For a long time after this, Piggy seemed willing to make the best of it. She was firmly set in her own mind that a well-behaved pig, who never did any harm, should be allowed the freedom of the barnyard. At last, she brought us around to her way of thinking, which saved her the trouble of planning out a new way of escape, as she had done every time she was fastened in.

So, when Fanny went to the lake for water, Piggy always trotted behind like a little colt. At night, she soon found out a better plan than cuddling alone in the straw. The way I came to know where she slept was this:—

A pale little boy, out of breath with running, burst into the dining-room just after I had lighted the lamp. There was a little tremble in his voice when he said:

"Oh! there is something alive in Fanny's manger. I was putting in more hay for her to eat to-night, and I felt it."

He was sure it could not be the pig. But, when I asked him if he really thought it was a bear or a wolf or a fox, he grew braver with each laughing shake of the head, and concluded to look again. When he found that it was the pig, after all, she was given another hay blanket for her funny bed under Fanny's nose.

As for all the other pigs in the world, our one all alone seemed to think that they had gone out of it. She certainly could not find them, so "this little pig stayed at home."

This was before she took her second journey. One day, a buggy drawn by a black horse passed within Piggy's sight. Never stopping to notice that this horse did not have Fanny's brown nose, Piggy thought:

"There goes Fanny; I shall go, too."

No dog in the land ever trotted behind a team more faithfully than this funny pig. Two, four, six, eight, ten miles she followed at the

heels of the horse she had mistaken for her friend.

A week later, we received a postal card from another town. It said:

Dear Sir:—I am told that it is your pig that followed my buggy from F. last Tuesday. She is safe at my farm, where you can call for her when it is convenient.

There was nothing for it but to make the best of Piggy's blunder, and bring her home again. But, as strange horses looking somewhat like Fanny might pass along at any time, we were obliged to make poor Piggy a prisoner. She minded the loss of her freedom less because of Thanksgiving and Christmas times, when "this little pig had roast beef," or other dainties quite as good every day. But the time came when she had none. She was even obliged to submit to having her ears of corn counted out for her, because the pile was growing very small.

The little boy who used to care for her had another home now, where there were little twin calves for him to feed. He used to say that little boys were good to keep milk from souring, but Piggy could not see that any more of it came into her trough now he was gone. She was once more at liberty, Fanny's strong hoof having helped her out; but Fanny's next neighbor in the barn was Jersey, the cow. If Piggy ever got into her manger by mistake, she was treated quite rudely.

So, with one trouble and another, we began to feel sorry for the pig, and engaged board for her at a farm.

Once more Piggy trotted behind the buggy to a land of plenty, where we left her with other pigs for company. Perhaps it was because this farmer also kept guinea fowls, which she heard always saying, "Go back, go back," that we heard her familiar grunt at our door the very next morning. Piggy had found her way home alone from two miles away, and now rests from her travels. Though of roast beef "this little pig had none" after she came back to her home, we all felt that some honor belonged to her for her faithful attachment to us all. So I will tell you what she now shares with the family.

Baby is very fond of making "patty cakes," and Clara tells how to make them. She is always ready with P for Papa, C for Clara, E for Baby Evelyn—herself—while mamma has a bite out of each. For, strange as it may seem to older little folk, our four-year-old girlie thinks quite as much of these "make-believe" cakes as she would of real ones, and is grieved if each one has not a share in baby's baking.

One day, little Clara was in too great a hurry with the C to mark her own cake, and O came out instead; but mamma sang right along, "Toss it in the oven to make Piggy grow." And now the baking is never finished until we have sung:

"Pat-a-cake, pat-a-cake, baker's man
Yes, I do pat-a-cake as fast as I can.
I roll it and prick it and mark it with O,
And toss it in the oven to make Piggy grow."
—Christian Register.

WEALTH IN SCHOOLHOUSES.—There are today in the five States of Ohio, Indiana, Illinois, Michigan and Wisconsin more than 50,000 schoolhouses, in which schools are maintained from three to ten months every year. The value of these buildings, with the grounds, is considerably over \$80,000,000, which is more than one-half that of all other public-school property in the Union. Nearly 3,000,000 children annually receive instruction in the public schools, while more than 85,000 teachers, a large number of whom have been trained especially for their work, are employed as instructors. The total amount expended each year for the support of these schools somewhat exceeds \$32,000,000, or more than \$8 for each child of school age within the States.

ACCORDING to the Nevada papers the water in Lake Tahoe is lower than ever.

DOMESTIC ECONOMY

Corn-Bread.

The difference in the quality of granulated or new process corn-meal, and of the stuff sold at most mills and groceries under the name of corn-meal, is equally as great as the difference between the best brands of patent and the poorest grades of "red dog" flour; yet there are only 40 or 50 mills in the United States that make corn meal by the new or gradual reduction process. To be sure, there is a vast difference in the quality of corn raised in different sections of the country, but the best varieties grown are always readily obtainable. And if millers and grocerymen would furnish a supply of choice corn-meal and corn-flour suitable for culinary purposes, they are such delicious and nutritive articles of diet, and can be prepared so easily and in such a variety of methods that they would soon win their way to popular favor, and be found in general use upon the tables of all classes. It is just as impossible to make good corn bread of poor corn meal as it is to make good wheat bread of poor flour. But until the average individual realizes this fact a large proportion of the corn-meal offered for sale will be as measly looking and worthless as it is at present, and consequently a large proportion of the corn-bread made will be unfit to be eaten.

Here are a few good recipes for corn-bread:

Dodgers.—Mix a teaspoonful each of sugar and salt, with a quart of corn-meal, and scald with boiling water till a paste is formed sufficiently stiff to retain its shape without spreading, when placed upon the griddle. Mold into cakes three or four inches in diameter and half an inch in thickness, put a bit of butter about the size of a pea where each cake is to be placed upon the griddle, and as soon as melted lay the cake upon it. Fill the griddle in this manner with cakes, and when they are brown on the lower side place a small bit of butter on each of them, turn over and gently press as close to the griddle as possible, with a knife or cake paddle. After being turned on the griddle and browned on both sides the cakes can be transferred to a baking-pan and finished in a hot oven; or, if more convenient, they can be baked altogether on a pan in the oven. Such dodgers can be baked in 30 or 40 minutes, but are sweeter and nicer when baked a longer time. The heat under the griddle should be moderate so as not to scorch the dodgers, and they may be turned several times if necessary.

Corn Crusts.—Scald a pint of corn-meal, into which a teaspoonful each of sugar and salt have been mixed, with a pint of boiling water. When sufficiently cool stir in a well-beaten egg, spread thin in a greased pan and bake in a quick oven.

Corn Pone.—Mix a teaspoonful each of sugar and salt with a pint of corn-meal, scald with a pint of boiling water and let stand till it swells and is about lukewarm, then add a half-ounce of compressed yeast, dissolved in a little warm water. If too stiff, reduce to the proper consistency with warm water, put in a well-greased baking pan, let rise, at a temperature of about 80°, for four or five hours or until light, and bake till thoroughly done in a moderate oven. Pone should be eaten fresh and hot, but is very nice when toasted, even after it is several days old. Home-made yeast may be used in place of compressed, but it requires so long for the pone to rise when mixed with ordinary yeast that it is generally slightly sour when baked.

Corn Muffins.—Mix together a pint of corn-meal, a teaspoonful of salt and two teaspoonfuls of sugar. Scald with a quart of boiling milk, and when sufficiently cool stir in the yolks and whites of four eggs beaten separately. Bake in shallow bread or pie pans, gem cups or muffins. If slappers or griddle cakes are desired, thin to the proper consistency and bake on a griddle.

Milk can be used instead of water in making all kinds of corn bread, and is preferred by many people; but a majority of corn-bread eaters think it is sweeter when mixed with water. It is difficult to give the exact proportions of meal and wetting in making corn-bread, as so much depends on the quality of the meal. Coarse granulated meal frequently takes twice as much water to swell it thoroughly as finer meal does, and care should be taken to always have the dough the proper consistency without closely following the recipe. Boiling water or milk should be used for scalding meal, as there is a vast difference in the quality of corn-bread made with water boiling briskly, and with water that has not quite reached the boiling point.—Mrs. E. P. Ewing in *Indiana Farmer*.

A NEW DEVICE FOR WASHING WINDOWS.—An Englishman has invented a machine by the use of which a servant can clean a window with safety, washing the sash and glass on the outside while standing on the inside. A belting is ingeniously arranged, and a water spray is fixed on the traveling cleaner, so as to play on the glass just above it, when fed by a rubber pipe, which ends in a bucket within the room. One hand of the operator squeezes a ball of rubber which drives up the water, while the other hand works the belting.

CREAM PIE.—Take one pint of milk, one heaping tablespoonful of flour, three tablespoonfuls of sugar, one tablespoonful of butter, two eggs and flavor to taste. Bake with one crust, the same as a custard pie. Beat the whites of the eggs to a stiff froth, spread over the pie after it is baked, and brown in the oven.

The Week.

The weather has been cool for the time of year, and in certain parts of the State the sky has been considerably overcast. Though no rain falls, the condition of air and sky lessens evaporation, and growing plants are making the best possible use of all available moisture. So notable is the result produced in some parts of the State, that grain has made good growth during the week and promises better than a week ago. Though this may help out some growers considerably, it is not wise to anticipate any great effect of such weather on crop aggregates. Commercial bears make the best possible use of every degree on the thermometer and every cloud in the sky to depress prices at this season of the year, and to entrap the unwary into contracts. There is every reason to expect very good grain and hay prices, and we hope the growers and not speculators will secure what benefit there may be in them.

Fruit crops are coming on apace, and newly planted trees and vines are favored by the weather. Where to get help is the great question. Nor are the fruitmen alone in this search. The hop-growers are on the anxious seat, and the new beet-growers at Watsonville want a hundred men to secure their crops from the weeds.

Origin of Races.

Europe, Asia and Africa all meet on the shores of the Mediterranean. Africa is surely the original home of the black man, Asia of the yellow man, and Europe of the white man.

When we get back from the point of contact in what is now Turkey, we find each race more and more distinct till all the shades are lost, and we have the distinct type, pure and undefiled, and, as we approach the center, the Mediterranean, we find traces of mixture, till they are so blended that we cannot say which prevails.

It is manifest that at some remote period these three races met each other near this common center. How? Simply as rambles, singly, or as families. The earth was not crowded then. Man did not increase very fast. The contest for life against wild beasts, famine, pestilence and accident was fierce and uncertain. Government, armies, planned invasions were unknown. It was simply as hunters for game or curiosity that drew these races to the common ground.

And when they saw each other, what a surprise it must have been. Imagine, if you can, black and white people meeting for the first time. It is impossible to think what might happen. A fright or a fight was inevitable, and both are possible. But it is certain that they did meet, and eventually mingled, and produced an intermediate race.

But the white man also met the yellow Asiatic, and the same thing occurred—mixed families. The three seemed to come pell mell upon each other, and produced varieties and shades innumerable. In Persia the Caucasian prevailed. In Arabia the Asiatic took precedence. The Moors of Africa might have been a cross of white and black, or Arab and black.

If we now draw a line from Norway to Arabia, we shall find at one end, light hair, blue eyes and whiteness; at the other, black hair and eyes, and skin; between, a gradual ascent from the one to the other. Let the line run to China and Japan, and the yellow deepens as you go. It seems a little uncertain whether the Chinese or the Malays were the original type. A line from Arabia through Africa brings us gradually to the black Hot-tent.

As the races met and the mixed families arose, it would seem that they showed more courage and force than the pure races, and drove them back continually. Thus the dark hair and eyes penetrated to France, to England, and even further north in some degree. The North of Africa was lost to the negro, and the pale faces entered India and Tartary.

While man remained a savage without a local habitation, the name applied to the tribe, or family, rather than the country. Government like that of Abraham was in the father, who ruled his children and his slaves. Polygamy was common, and the Chief and his sons became indeed the fathers of their people. Hence the family likeness in the Jews and other small nations. They made war to extermination of all the males of mature age, and slavery for the women and children. The rising generation were of the blood of the conquerors.

This was the origin of the feudal system, and gave national characteristics. The blood of the Chief, or King, was diffused among his nobles, and they, on the same plan, bestowed it on their vassals. The whole clan became one family.

Thus the Western nations took their features and complexion not so much from the climate as from their actual descent. When monogamy came into fashion it somewhat broke the line and the distinctive features passed away. More recently friendly treaties and travel and inter-marriage have brought Europe almost into a homogeneous mass as to the nobility, but when you come to the classes that do not travel you know them and their location by their features and dialects.

The American people are likely to be still further compounded and their race and origin lost in a chaos of multitudinous ancestry. The United States is another center where we meet to contend again for place and supremacy, not by battle, but by lawful and peaceful emulation. All the races of the earth are represented here, either by a primal or a secondary specimen. We are told that the fittest will survive, but the fittest for what? That is an important question for us. What shall our race be? Shall the people of this republic be

the most intelligent, the most beautiful, the most moral on earth, or shall some other quality, some crooked deformity, take charge of our country and make the most unscrupulous cheat the type of the future?

It is for us to say. If we set up such a moral atmosphere that only honor and beauty can thrive, why honor and beauty will come to the front and all else fade and die out. But if we permit intrigue and villainy to take all our high places, what we sow we shall reap. The majority of our people are on the side of virtue, and it will in the end prevail against all its enemies. They die. Virtue lives.

Fairs of 1888.

Repairs and refitting are now in active progress on the State Fair grounds in Sacramento. They include an entire renewal of the underpinning under the grand stand, replacing with brick piers the old posts which have yielded to contact with the soil. There will also be a renewal of the apartments under the grand stand, so far as the carpenter work goes. If we had our way about it, we should like to refit the whole basement of the grand stand morally, as it is about the worst place in this way imaginable.

An improvement at the park which will be generally appreciated is the addition of new space on Twenty-third street. The sheep and swine pens will be removed to this part of the grounds. Cattle and horse stalls will be constructed around the outer edge of the property purchased. The carriage entrance is to be changed to Twenty-third street, coming into the grounds on G street, exactly opposite the foot entrance on Twentieth and G streets. This will obviate the necessity of driving around among the stalls where the horses are being cared for, and where there has heretofore been some risk in passing them. The new entrance will land exactly where the roadway crosses the track on the east side of the grounds.

We give below a list of fairs to take place in this and adjoining States the coming season, arranged in the order of their dates, so far as known. We intend to republish it, revised from time to time, and shall be grateful for any aid which officers of associations may give us in correcting errors and filling gaps:

Los Angeles—Live-Stock department.—Aug. 6 to 11 (Hort. department, October).
Ione—26th Dist.—Aug. 7 to 10.
Mechanics' Institute, San Francisco.—Aug. 7 to 10.
Santa Rosa—Sonoma Co.—Aug. 13 to 18.
Petaluma—4th Dist.—Aug. 20 to 25.
Placerville—8th Dist.—Aug. 20 to 25.
Chico—3d Dist.—Aug. 21 to 25.
Oakland—1st Dist.—Aug. 27 to Sept. 1.
Marysville—13th Dist.—Aug. 27 to Sept. 1.
Sacramento—California State—Sept. 3 to 15.
Santa Barbara—10th Dist.—Sept. 11 to 14.
Independence—18th Dist.—Sept. 17 to 21.
Reno—Nevada State—Sept. 17 to 22.
Salem—Oregon State—Sept. 17 to 22.
Stockton—2d Dist.—Sept. 18 to 22.
Concord—Contra Costa—Sept. 24 to 29.
San Jose—S. Clara Valley—Sept. 24 to 29.
Susanville—11th Dist.—Sept. 24 to 29.
San Luis Obispo—16th Dist.—Sept. 25 to 29.
Salinas—7th Dist.—Oct. 1 to 6.

GREAT WORMS ON THE VINES.—The vineyards in the upper part of Napa valley are suffering considerably from great striped or spotted caterpillars. They are larvæ of two species of Sphinx moths or humming-bird moths. The moths are seen hovering about the flowers in the evening and are particularly partial to verbenas. These worms have done much harm in other years in other vine districts. Around Woodland and Fresno they were very abundant many years ago. There are two ways at least of fighting this pest. The moths may be stricken down and killed in large numbers in the garden and thus future hatches of worms prevented. The best way to treat the worms on the vines is to spray with Paris green—one pound to 150 gallons of water. This is death to all leaf-eating vermin.

AMERICAN SOUTHDOWN ASSOCIATION.—The Seventh Annual meeting of the American Southdown Association will be held in the Illinois National bank building, Springfield, Ill., May 30th. Parties who have heretofore not thought a public record of Southdown sheep necessary, are now being led, by the increasing demand for recorded animals, to seek the registry of their breeding stock. This fact, with the growing interest in mutton sheep throughout the country, is encouraging to every member of the association and patron of the record. S. E. Prather of Springfield, Ill., is secretary of the association.

Fruit Notes.

The fruit is beginning to move eastward overland, although no assurance has been obtained from the railway authorities as to rates to be charged this season. Our Vacaville correspondent gives a very interesting account of these first shipments in another column.

The representatives of the Fruit Union made a forcible statement to the Railway Managers' Convention of the needs and demands of the growers for less rates and better time than were given last year, but there does not seem to be any disposition on the part of the railway people to act in the matter. It is still interesting to give an outline of what was claimed, even though it is not granted. The report in the *Chronicle* says:

Mr. Hatch said that the California fruit-growers could not reach the English market under favorable conditions unless there was a change in the present system of fruit-shipping as well as in the transportation charges. The Fruit Union wanted the ten-car-train arrangement so altered as to permit of the carrying of fruit through to New York and other cities east of Chicago by the single carload. Under the present arrangement the trainload rate does not apply to New York shipments unless five of the ten cars are sent East from Chicago. This practically shuts California fruit-shippers out of the far Eastern market. They cannot afford to pay the present high single-carload charges. A rate of \$300 a car in ten-car lots to Chicago and of \$400 a car for single cars in this same train to New York was asked for, and if it were granted he had no doubt that the shipments would be greatly increased. The union was ready and willing to continue under the present system of ten-car trains, but he thought that it ought not to apply farther east than Chicago under the present restrictions.

Mr. Pratt of the firm of Pratt, Gilman & Francis of Minneapolis, who was present, wanted an "open train," in which the shipments were not controlled by any man or set of men. He was willing that the Southern Pacific Company should receive the freight in its own way and control all the shipments.

Mr. Hatch said that single-car rates to Chicago were too high, and that they should be reduced to \$200 a car for slow freight to Chicago, and \$400 or less on passenger trains.

The labor supply continues to be the uppermost topic in the fruit districts. All available supplies are being drawn in. Quite a number of Japanese are being secured, but there is no great supply of this material, most of those now in the State being here on educational errands, and they find plenty of profitable housework to do. However, some are appearing in the fruit districts. Reports of the negro experiment at Fresno continue in the main favorable. A. B. Butler of Fresno writes to the State Board of Viticulturists that the colored help that he has recently secured from the Southern States are making capital field hands, and that he is using 100 of them to advantage in his vineyards. The pay averages \$15 per month. Even the boys are stated by Mr. Butler to be familiar with plowing, handling horses, etc. Should the experiment with colored help prove a success this year, many more will be imported next spring. Dr. Hastings of Fresno, who is trying the same experiment, states that his colored help is about the best he has.

Petaluma seems to have advanced most quickly in the employment of school-children. The schools of that city closed last week for a three months' vacation and the Petaluma cannery opened at once on cherries with 75 hands.

The influence of the assignment of the J. Lusk Canning Co. upon fruit contracts made by their representatives is quite a question in districts where they have been buying. Our Vacaville correspondent says the agent who bought fruit in that district has revisited the growers and assured them the fruit would be taken as agreed. At a meeting of the directors of the suspended cannery held in this city on Monday afternoon of this week, and it is reported that William Lawson, Barry Baldwin and C. E. Palmer were appointed by the creditors to confer with David Wilcox, the assignee, as to the means of immediately disposing of the plant, so that the purchaser may use it in the coming canning season. A public statement of the assets and liabilities has been made, the total liabilities, \$253,680.41, and total assets, \$39,530.36. The calculation probably is that the purchaser of the plant will corral the fruit contracts, which we imagine are rather desirable property. It is announced as probable that the whole assets will be sold at auction.

SENATOR STANFORD and wife will shortly go to Carlsbad.

The Maple Sugar Product.

Now that it has been demonstrated, as recently stated in the PRESS, that one of our native maples (*Acer macrophylla*) is a satisfactory source of maple sugar, it is possible that California may grow to be a leading maple-sugar State. These trees are naturally abundant in some parts of the State, and are very satisfactory for forest planting, owing to their easy growth from the seed and rapid progress afterward. In view of these facts a few notes, which we collect from an Eastern exchange concerning the maple-sugar production in Vermont, may be interesting. In reference to the distribution of the Eastern sugar maple we read as follows:

Though it does not elsewhere usually form so large a proportion of the forest as in Vermont, the sugar maple is a widely distributed tree, growing in Newfoundland and south through the Northern States, along the Alleghenies in the Southern States, and even in Florida a variety of the species is found. It is not rare in any large extent of territory in the Northern States east of the Mississippi. There are many large, thrifty maples in the forests of Michigan, Ohio, Pennsylvania, West Virginia, etc., but they do not in general yield sugar like the maples of Vermont; the sap is not so sweet and the quality of the sugar not so good. Even here there is a difference in the quality of the sap and the sugar which it makes, according to the situation of the trees. Maple growing in a low, damp soil or on the northwestern slope of a hillside produce a poorer quality of sap, and generally less in quality, than trees in other situations.

The two States—Vermont and New York—produce about half the maple sugar and syrup made in the United States. According to the last census, the total product of maple sugar in the United States was 36,576,061 pounds. Of this, Vermont made 11,261,077 pounds—over 2,000,000 pounds more than a fourth part of the whole. The total production of maple molasses in the United States was 1,796,048 gallons, equal to about 14,000,000 pounds of sugar, making the total product of maple sugar and molasses equal to 50,000,000 pounds of sugar. Vermont made very nearly one-half of this total.

Maple sugar is made in 23 States. Six States made, as reported by the census of 1880, more than 2,000,000 pounds each, as follows:

	Pounds.
Vermont.....	11,261,077
New York.....	10,693,616
Michigan.....	3,423,149
Ohio.....	2,895,782
Pennsylvania.....	2,866,010
New Hampshire.....	2,721,945

In addition to the sugar, nine States made more than 40,000 gallons of maple molasses each as follows:

	Gallons.
Ohio.....	495,839
New York.....	266,390
Indiana.....	252,084
Pennsylvania.....	140,667
Michigan.....	131,990
Vermont.....	128,091
Maine.....	82,007
New Hampshire.....	79,742
Wisconsin.....	58,712
Illinois.....	40,077

The production of maple sugar is said to be not one per cent of the whole amount of all kinds of sugar consumed in the country, and is not likely to increase in amount so that its price will be depressed by ordinary cane sugar. On the other hand, the call for a fine quality of maple sugar and syrup appears to be increasing from year to year, and it is doubtful whether in future enough will be made to supply the demand. For two years past the markets have been cleared of old maple sugar with a demand for more. The indications now are that whatever may be the price of other sugar, there will always be buyers willing to pay a good price for a nice quality of the maple product.

A FINE BULL FOR HUMBOLDT COUNTY.—Mr. S. B. Loveren of Eureka, Humboldt county, has been paying a visit to Baden farm. He takes home with him the fine young roan Shorthorn bull Prince Pansy, 13 months and 2 days old, and weighing, in San Francisco, 980 pounds, his heart girth being 5 feet 9 inches, which we consider good weight and good measure for a hand-raised calf. As Mr. Loveren has a few good milking Shorthorns on his cheese dairy near Eureka, he was desirous of getting a breeding bull of the best milking strains, which he has without doubt got in his choice of one from the old and reliable Pansy tribe.

NEVADA sheep are finding summer pasturage in Mono county, California, and the owners willingly pay the license tax of five cents a head.

Farmers' Steam Generator and Engine.

Uses for small steam generators, with and without engines, are multiplying as our agriculture becomes more diversified. The engraving on this page shows a California invention for which a patent was secured through Dewey & Co.'s agency in September last. It is useful in the form shown in the engraving for running small manufacturing machinery of all kinds, or for pumping, cutting and grinding feed, sawing, etc., also for dairy work. Without the engine it is an excellent steam generator for heating or other purposes. The machine occupies but little space and is easily

FARMER'S PATENT STEAM GENERATOR AND BOILER.

accessible in all parts for cleaning inside and out. The side plates rest on hooks at the bottom and fit in a recess at top and can be lifted off, the soot brushed from tubes and the plate replaced in a few seconds without tools. The water tubes each have a plug opposite the end of the tube, so the scale or sediment can be readily

WALNUT DRIER USED BY RUSSELL HEATH OF SANTA BARBARA.

removed without disturbing the tube. The water spaces at front and back also have plugs for cleaning the inside, and it can be accomplished in a few minutes. This is an excellent feature, as the best boiler will soon burn out with bad water if there is no way to keep it clean.

These generators are made of different sizes and are furnished with and without engines. The form shown in the engraving is a four-horse generator with a three-horse engine. The manufacturer is E. H. Farmer of Gilroy, who is also known to our readers as a manufacturer of vises and cheese-presses. The generators are taking well and are being ordered from different parts of the coast, one being shipped to Arizona last week.

SALT LAKE CITY is to have a fruit cannery. It will start with a paid-up capital of \$100,000.

A Satisfactory Shorthorn Sale.

The sale of Shorthorns at Sacramento on Thursday last brought together a respectable company of breeders in search of fresh blood to infuse into old herds, while not a few were on the lookout for suitable animals for the foundation of future herds. Col. S. A. Sawyer, the auctioneer, by his agreeable and gentlemanly manner in conducting the sale, gave general satisfaction to all. The colonel knows a good beast as well as a good pedigree, an advantage, under most circumstances, to both buyer and seller, especially to the buyer who had not the opportunity of referring to the herd-books when necessary to do so, which it often is when one wants to get at the bottom of a pedigree.

The sale cannot but be considered a success when 42 head of cows, heifers and calves, sold for \$4860, an average of \$115 70, and eight bulls made an average of \$179, equal to an average of \$125.90 for the 50 head sold belonging to Messrs. Dunlap and J. S. Latimer & Sons. The cattle were in good, thrifty condition, though some of them might not improperly be called fat—at least fat enough for a show-ring.

The highest priced cow was the beautiful three-year-old, Red Rose of Cedar 3d, a descendant of imported Rose of Sharon by Belvedere (1706). Lillie Belle Geneva 3d (a "Young Mary"), with her seven-months old bull calf by her side, sold for \$310.

The yearling bull Baron Acomb 5th sold for \$400, being the highest priced animal sold, which must have been more on account of the "blue blood" coursing in his veins than for individual merit, as there were better bulls, of good sound breeding, sold for a good deal less money.

After the sale of Dunlap & Latimer's cattle there were sold about ten head of cows and seven bulls belonging to Messrs. Bill & Burnham, among which were some remarkably good animals. Water Sparkle, a light roan, thick-bodied, short-legged cow of the Torr Waterloo family (Booth upon Bates) was deservedly the favorite among the cows. With a roan heifer calf by her side, the two sold for \$390. The best bull sold was the yearling Earl of Aylesby 2d, a short-legged bull of great substance, de-

Russell Heath's Walnut Drier.

Our correspondent who recently visited place of Hon. Russell Heath, in Carpinteria, Santa Barbara county, thoughtfully prepared for us an outline sketch of a drying-house which Mr. Heath devised to prepare his walnuts for market, and which he has found very speedy and effective in operation. Walnuts are finished in eight hours from the time of placing in the drier, and our correspondent assures us that Mr. Heath dried the entire crop of 280 acres of walnut trees with 12 cords of wood. As the crop brought an aggregate value of \$10,000 last year, the drying is certainly very economically done. Mr. Heath has no patent on his drier, and any one who chooses is at liberty to make use of it. He has been growing walnuts for 25 years, and this fact, with the intimation of his large crop, indicates that his experience is valuable. It is usual to count 12 hours as the time required to finish walnuts in a drier, or 8 to 10 days in the sun.

In the little sketch on this page *F* is the furnace; *H* is the opening to let in the cold air and bring in the draft; *A* is the heating-room for the air, which is divided through partition *D*, one part of it passing through *B* into the drawers 1 and 2, and the other through drawers 3 and 4 into *M*, whence it is allowed to escape into *G*, the chimney regulated by another register *R*. *K* is the cellar and *L* the stairway; *E* is the outside building, which is, of course, higher than indicated in the sketch.

Mr. Heath has found it best to put the fresh nuts into drawer 1 and move them downward, according to their state of dryness. The drawers close, of course, airtight, and have a wire netting for a bottom. They are 5x36x30 inches. The flues from the furnace are marked *x*; they run through the whole length of the heating-room *A*. The drier frame rests upon stone walls, marked *S*.

This description is not as explicit as it might be, but probably our readers' ingenuity may supply the details which are lacking. If not we will endeavor to secure fuller points if questions are asked. We would also like to know what other nut-growers have found satisfactory in preparing their crops for market.

PROGRESS OF THE UNITED STATES.—Probably no one thing will give a better idea of the progress of this country than the following facts in regard to our postal service: The immensity of the United States postal service is not easily comprehended. The sum to be appropriated for its maintenance during the year ending June 30, 1889, exceeds \$60,000,000, and of this formidable aggregate all but \$2,500,000 is derived by the department from its own revenues. The extraordinary growth of the country during the last 50 years is indicated by the fact that in 1839 the postal revenues were less than \$8,000,000. The present expenditure for railway transportation of the mails is \$19,000,000, their weight being the basis of compensation. On seven of the great trunk lines there is now carried an average daily weight of 578,984 pounds of mail matter, or 289 tons. The deficiency in receipts as compared with expenditures during 1889, according to the estimates, will not be half of what it was in 1876, when the letter postage was 50 per cent higher.

A MAMMOTH ENGLISH GRAPEVINE.—The largest specimen of a growing vine in Great Britain is a Black Hamburg vine in Kennell, in Perthshire, Scotland. This vine, planted about 56 years ago, has a main stem 22 inches in circumference and completely fills a glass house 270 feet long, and is still growing as rapidly as ever. Its yield last year was 2548 bunches, of which only about 500, averaging about two pounds each, were allowed to mature. A substantial subsoil of leaf mold was used when the vine was planted, but the only extra material which the vine now receives is broken bones in half-inch pieces. This vine exceeds in size the famous Black Hamburg at Hampton Court, the principal branches of which are about 110 feet long, though its trunk is 38 inches in circumference.

TO PRESERVE THE NATURAL COLOR OF FLOWERS.—A method of preserving the natural colors of flowers consists in dusting salicylic acid on the plants as they lie in the press, and removing it again with a brush when the flowers are dry. Red colors in particular are well preserved by this agent.

scended from imported Telluria Wassail, a cow that the writer had the pleasure of seeing sold for 310 guineas (about \$1600) when the herd of the late Wm. Torr was sold on the 2d of September, 1875.

The day following the sale of thoroughbreds there was an auction of high-grade Shorthorn heifers from the breeding farms of W. P. Higginbotham and Bill & Burnham of Manhattan, Kansas. Very satisfactory prices were received.

NURSERYMEN'S CONVENTION.—The thirteenth annual meeting of the American Association of Nurserymen will be held in Fraternity hall, Detroit, Mich., commencing Wednesday, June 20, 1888, at 10:30 A. M., and continuing three days. Hotel headquarters at the Michigan Exchange. Rate, \$2 per day (special). For further particulars address the secretary, D. Wilmet Scott, Galena, Illinois.

THE VINEYARD.

Raisin Growing.

The following paper was read by Supervisor T. C. White of the Raisina vineyard, near Fresno, before the State Viticultural Society at its recent meeting:

The subject assigned me for consideration and to which I invite your attention is

The Raisin Grape.

While I do not expect to add to the information of many who have been long engaged in the business, still there may be some to whom the results of our experience may be interesting if not profitable.

Ten years ago, I was among those seeking knowledge, and found a most efficient teacher in R. B. Blowers Esq., who kindly gave me the benefit of his experience in the then comparatively new field of raisin-grape culture.

The success achieved in the past few years has outgrown a local interest, and is now attracting a word-wide attention. The following table shows the growth of the industry:

1873.....	6,000 boxes
1874.....	9,000 "
1875.....	11,000 "
1876.....	19,000 "
1877.....	32,000 "
1878.....	48,000 "
1879.....	65,000 "
1880.....	75,000 "
1881.....	90,000 "
1882.....	115,000 "
1883.....	140,000 "
1884.....	175,000 "
1885.....	500,000 "
1886.....	703,000 "

In 1873 the raisin crop of the State was estimated at 6000 boxes, swelling to the comparatively enormous number of 800,000 boxes in 1887, and may reasonably be expected to reach 1,000,000 boxes the coming year.

It has been demonstrated beyond question, that the soil and climate of portions of this State will produce a grape equal in size and quality to those of the most favored districts of Europe.

Permit me to make a few general remarks in reference to the soil, climate, culture and varieties to be grown, and the best manner to pick, dry, sort and pack raisins for market:

In geographical distribution the yield is divided between the great San Joaquin valley and Southern California. No raisins are produced in any quantity outside of these two regions. The crop of the valley amounts to 505,000 boxes; that of the southern counties—Los Angeles, San Bernardino and San Diego—to 295,000. Fresno takes the lead with 350,000 boxes, nearly double the yield of any other district and nearly as much as that of all of the rest of the State combined. Riverside comes next with 180,000 boxes.

While I have visited the raisin-producing sections of the State, north and south, my remarks are based upon the experience gained during the last few years in Fresno, in the San Joaquin valley. The following requisites are indispensable to the successful production of good raisins: Soil, climate and methods of picking and curing. First, a selection of location with reference to soil. This, in my judgment, is either the white ash or the red, sandy loam. If your "lines be cast" in the San Joaquin valley, which I believe to be the best for this industry, be certain to obtain land which can be conveniently irrigated.

My own choice would be white ash, if not too strongly impregnated with alkali. So far as I am informed, the first raisin-grape cuttings were imported by the elder Haraszthy in 1862. These were the Muscatel Gordo Blanco; later there were other importations which were sent to different portions of the State, and assumed the names of Muscatel and Muscat of Alexandria, causing much diversity of opinion in reference to identity and respective merit. "When doctors disagree, who shall decide?"

My vineyard is exclusively Muscatel Gordo Blanco, which I consider the best on account of its uniform large size of berry throughout the entire cluster, small size and number of seeds, tender skin, richness of pulp and high flavor.

The vines should be trained low and pruned short, and great care and judgment should be exercised in this matter, so as to leave the vine well balanced, not having more spurs on one side than the other, and also leaving top spurs with a view to growing wood for shade.

Another important consideration is the removal of all suckers and non-fruit producing growth to avoid the diversion of the strength and vigor of the vine from the fruit and growth of wood for the succeeding year. The vineyard should be plowed and cross-plowed as soon as the vegetation starts in spring, and cultivated thereafter continuously until prevented by the growth of the vines.

Much can be done toward destroying the vinehopper by thoroughly stirring and displacing the soil immediately around the vine early in the season.

To assist in accomplishing this, plow away from the vine, then shovel directly around it, and then cross plow, turning the furrow toward the vine.

Another important aid in destroying this pest, is sulphuring, which should be commenced as soon as the vine has put forth a new growth of one of two inches. Just before blooming,

sulphur a second time, and in localities liable to mildew, a third application may be beneficial. Couleur, or the blasting or dropping of the bloom, is probably caused by sudden changes of temperature, strong winds and excessive moisture. When caused by the latter, it can be largely overcome by the application of sulphur. As vines become older, I think they are less susceptible to climatic influences. Irrigation at the blooming period should be avoided, and until the berry is well set.

If summer irrigation is necessary it should be done by means of furrows, through which the water is run.

Plowing in these furrows will prevent the cracking and drying out of the land.

In Fresno, picking commences about the 1st of September, although there have been seasons when it occurred as early as the 20th of August.

The grapes under no circumstances should be picked for raisins until they are ripe. There are three ways by which to ascertain this fact—first, by the color, which should be a light amber. Second, by the taste, and third, by the saccharometer, which is by far the most accurate.

A grape may be ripe and not have the proper color when grown entirely in the shade.

The juice of the grape should contain at least 25 per cent saccharine to produce a good raisin.

The most practicable method of drying is by the use of trays placed upon the ground. The almost entire absence of dew in our locality greatly facilitates this method.

The trays are usually 24x36 inches. Those of larger dimensions are found inconvenient to handle when filled. Trays of the former size hold about 20 pounds of fruit, and should produce from 6 to 7 pounds of raisins.

The product of a vineyard depends largely upon its age and favorable conditions, varying from 2 to 9 tons per acre.

The trays or platforms are taken into the field and distributed along the sides of the roads, from which they are taken by the pickers as they are needed. As the grapes are picked from the vines, all imperfect berries, sticks and dead leaves, are removed from the bunches, which are then placed upon the trays, right side up. A cluster has what is called a right and a wrong side, the wrong side having more of the stems exposed than the right side. Great care should be used in picking so as to handle the bunches only by the stem. If the berries come in contact with the hands some of the bloom will be removed, which will injure the appearance of the raisin.

The trays are placed after filling between the vines, one end being elevated, so that the grapes may receive the more direct rays of the sun.

The length of time required for drying depends much upon location and conditions, favorable or otherwise. I have known raisins to be dried in seven days, but they were not a good article, and too rapid drying is not desirable.

The grapes are left upon the trays until about two-thirds dry, which, with us, will be in from 6 to 8 days. They are then turned. This is accomplished by placing an empty tray on top of the one filled with partially dried raisins and turning them both over. Then take off the upper or original tray, and you have the raisins turned without handling or damage.

After turning, curing proceeds more rapidly, and frequently is completed in four or five days. During this time they should be carefully watched, to prevent any from becoming too dry. When it is found they are dry enough, the trays are gathered and stacked one upon the other as high as convenient for the sorting which follows. This protects them from the sun and prevents overdrying. Stacking should be attended to early in the morning while the stems and berries are slightly moist and cool from the night air, as they will retain this moisture after being transferred to the sweat-boxes and assist in quickening the sweating process.

The trays which have been stacked are now ready for sorting and grading, and this requires care and judgment, and, although a tedious process, greatly facilitates rapid packing.

The sweat-box is a little larger than the tray, and about eight inches deep. When filled these will contain about 125 pounds of raisins. Heavy manilla paper is used in the boxes, one being placed in the bottom and three or four more at equal distances as the filling progresses.

The object of the paper is to prevent the tangling of the stems and consequent breaking of the bunches when removed for packing.

The sorters have three sweat-boxes—one for first, second and third qualities, as the grade will justify. The bunches should be handled by the stem and placed carefully in the sweat-boxes to avoid breaking the stems, thereby destroying the symmetry of the clusters.

Any found to be too damp are returned to the trays and left a day or two longer in the sun. To ascertain if they are perfectly cured, take a raisin between the thumb and first finger and roll it gently until softened, when either jelly or water will exude from the stem end; if water, it requires further drying. When the boxes are filled they are taken to the equalizer. This should be built of brick or adobe and as near air-tight as possible, but provided with windows to allow of ventilation when necessary. The windows should have shutters to keep it dark. The filled boxes are placed one exactly upon another to a convenient height and should remain from 10 to 20 days or more, when they will have passed through the sweating process.

As the raisins are taken off the trays some of the berries on the bunches will be dry enough and a few will not be sufficiently cured. To

remove the moist ones would destroy the appearance of the cluster, and to leave it out longer would shrivel the dry ones, hence the sweat-box. The moisture is diffused through the box, some being absorbed by the dry raisins, and the stems also taking their share, and are thus rendered tough and pliable and easily manipulated when ready for packing. When the raisins are sufficiently equalized, the sweat-boxes are removed to the packing-room, which is provided with tables, presses, scales, etc. My method of packing is substantially the Blowers' style, face downward. The most convenient mode of packing is by the use of a metal tray corresponding in size to a layer of raisins and having a loose bottom. The raisins are placed in the preliminary packing tray with the face of the cluster downward, which gives the surface a level appearance and prevents the exposure of the stems. When the bottom of the packing-tray has been covered, which should always be with perfectly shaped berries and bunches, the tray is filled to the requisite weight of five pounds. The contents of the tray are then pressed sufficiently to pack the raisins firmly together, but not with such force as to break the skin, causing the jelly to exude, and consequent early sagging.

After being pressed, they are transferred to the boxes, during which process the paper is wrapped around each layer. The paper is placed on the top of the tray of raisins and a sheet of steel the exact width of the tray is placed above the paper, and the whole reversed. The sheet of steel serves to hold the raisins in place until the layer is put into the box, when the steel is withdrawn and the layer drops into the box—face up.

The standard box of California raisins is 20 pounds weight, containing 4 layers of 5 pounds each.

They are usually graded into Dehesias, London Layers, Layers, and one, two and three Crown Loose Muscatels. The Dehesia or highest grade is packed with a view to superseding the imported article, which sells at from \$10 to \$12 dollars per box.

Every one has seen and admired the boxes of imported raisins, which have a top layer packed in rows with uniform regularity; few, however, appreciate the difficulty of producing this handsome appearance by hand. The task is slow and tedious. To simplify and expedite this process, I have invented and received letters patent for a packing plate, expressly adapted to producing this effect. This device will prove of great assistance to the raisin packer. I have used it through two seasons with perfect success.

The invention consists of a flat metal mold or plate, having depressions made in its surface, which plate forms the bottom of the preliminary packing-box, and serves to hold the raisins in a fixed position, until the packing is completed and the raisins are placed in the raisin-box. Loose Muscatels are prepared by being put through the stemmer and grader. The stemmer removes the berries from the stems, and the grader by separating, according to size, determines the grade.

By observing the foregoing remarks, you will naturally conclude that the raisin business is eminently made up of details. None can be carelessly performed or overlooked if we expect to compete successfully with the nations who have made this subject and industry a study for centuries.

Not only in the essentials of quality, and quantity, but in this esthetic age a due regard to effect must be observed in the way of attractive wrappers and labels.

The industry with us is in its infancy, comparatively, and while we have some cause for gratulation, still we have much to learn before we attain perfection. In reference to shipping it is to be hoped that the near future may bring us better facilities, and cheaper rates of freight, thereby enabling us to supply the Eastern market and the growing foreign demand. I note by late quotations that all grades of raisins are scarce in the home market and insufficient to meet the demand until the next crop. May this be an incentive to us to increase and extend the industry through the length and breadth of our inland valleys.

Much may be accomplished by a free interchange of ideas and comparison of notes in reference to methods and results. Local and State conventions afford good opportunities for such conferences.

\$500,000

On Country Real Estate in large and small amounts at lowest rates, by A. Schuller, 106 Leidesdorff St., Room 3.

HALL'S SARSAPARILLA!

THE BEST BLOOD PURIFIER AND TONIC ALTERNATIVE IN USE.

It cures disease originating from a disordered state of the Blood or Liver. PALM VALLEY!

TROPICAL WONDERLAND!

EARLIEST FRUIT LAND IN THE WORLD.

EARLIEST VEGETABLE LAND IN THE WORLD.

FINEST WINTER CLIMATE IN THE WORLD.

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?

DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?

DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?

DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND COMPANY

Has secured 2000 acres of this choice land; has subdivided it into 5 and 10-acre lots, which they are now selling at \$200 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. Two hundred acres have now been sold on this basis, starting at \$150 per acre. The price is now \$200 per acre.

The Company has a Stone-walled Irrigating Canal, over ten miles in length, completed.

They have completed a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the town site owned by the Company.

They are planting 160 acres to an orange grove, of Navel oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State. No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

THERE IS NO FROST, NO FOG, NO HARD WINDS.

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

JUDSON POWDER.

The Only Reliable and Efficient Powder
For Stump and Bank Blasting. From 5 to 20
pounds blows any Stump, Tree or Root clear
out of ground at less cost than grubbing.
Railroaders and Farmers use no other.

POWELL'S PATENT DERRICK.

MOVING.

UNLOADING.

Derricks complete, with ropes and block (no nets).....	\$120 00
One long net for one wagon.....	22 00
Two short nets for one wagon.....	32 00
Powell's Patent Net Blocks, per pair.....	8 00
Powell's Patent Foot Blocks, each.....	5 00

IMPORTANT FEATURES.

The entire wagon load is hoisted up in a center opening net, by a self-braced Portable Derrick, which is moved from stack to stack ground without being taken down. Half an hour is ample time to move and set. Two nets can be used in each box, and the load taken out in two parts by having a partition in the box. Any farmer can at once see many advantages gained by the use of this invention.

One large or two small Nets used for each wagon. Parties having boxes longer than 16 feet should order two nets for each box.

In ordering nets, send inside length of box, and state whether one or two nets are required for each.

In Use Over 15 Years and never One Returned.

The Only Successful Sickle Grinder Ever Made!

Every Machine Warranted. There are more Boss Sickle Grinders sold every year than all others combined.

ONE MAN CAN GRIND A SICKLE easier and in less time than TWO by the OLD WAY, and every section will be ground to a TRUE BEVEL as when it came from the factory.

It costs but a trifle more than an ordinary Grindstone, with frame and hangings, and can be used for all purposes. Price, \$8. MANUFACTURED FOR

P. P. MAST & CO., Pacific Coast Agents, 31 Market St., San Francisco.

Orchardist Wanted.

Wanted, a man to take charge of a farm in Contra Costa county containing an Orchard of 220 acres, a small Nursery, some grain land, horses, cows, etc. Address A. F., Box 2361, San Francisco, Cal., stating age, experience, nativity, wages expected, etc. References required.

THE DOG in health, habits and disease. All breeds and treatment; 50 cuts; 25c. Thi. office.

Palermo.

About five months ago the Palermo Land and Water Company, composed of D. K. Perkins and Henry Wise, well-known merchants of Oroville, and Ex-Governor George C. Perkins, C. W. McAfee and A. S. Baldwin of San Francisco, purchased 6900 acres of land five miles south of Oroville on the line of the Northern California railroad. It would be difficult in the State to find a more charming and picturesque spot, fanned by the most genial and health-giving sea-breezes. The land is marvelously rich, adapted to all variety of fruit and floral culture, but was specially selected for its adaptation to the growth of semi-tropical and citrus fruits. No finer oranges are grown in the State than in this portion of the northern citrus belt.

About 250 acres of this tract have been surveyed into town lots, and about 1600 acres of the remainder have been subdivided into suburban tracts each one, two, four, ten and twenty acres. About the center of this tract two entire blocks and part of two others have been set apart for a park, and two blocks on the crest of an elevation reserved for a hotel. This property thus plotted and surveyed about four months ago was placed upon the market, and the sales have been surprising. Nearly all the one and two acre lots in the immediate vicinity of the town have been sold. The work of developing these lands has commenced in dead earnest. Acres over which the sheep and cattle roamed four or five months ago have undergone a magical change. Broad avenues have been opened and about nine miles of streets graded. These lots and tracts are offered on reasonable terms, the company agreeing to furnish the purchaser plenty of excellent water free for three years.

Purchasers desiring it can have their lands cultivated by the Palermo Land and Water Company, on the most reasonable terms, as the company is interested in the success of every grove and orchard planted on this tract. The following is the approximate cost of planting a ten-acre lot in the best selected fruit:

Two acres of oranges set 20 feet apart containing 216 trees at a cost of \$100 an acre.....	\$200 00
Preparing ground, planting and cultivating for one year at \$20 per acre.....	40 00
Two acres in choice figs 36 feet apart containing 60 trees at 35 cents each.....	21 00
One hundred and eighty peach, apricot and prunes at 20 cents to set alternately with the figs.....	36 00
Cost of setting figs and these trees on two acres for one year.....	40 00
Six acres to raise grapes set 6x8 feet, containing 3600 vines at \$15 per acre....	90 00
Plowing, cultivating, etc., one year at \$10 per acre.....	60 00
Total.....	\$487 00
Or say \$500, averaging \$50 per acre.	

The second and third years the expenses of cultivation will be \$12.50 and \$15 per acre and thereafter the returns will more than pay expenses, and the net profit may be increased from \$50 to \$1000 per acre, according to the character of the fruit and the ability of the cultivator.

Over 300 acres of land have thus been plowed, and 250 acres of this have been planted with orange trees and vines. Twenty-three thousand trees have been planted up to date, 21,000 being orange trees, the remainder of deciduous trees, and five acres have been planted in vines. Several property owners wanted their land this year planted in vines, but the company was unable to get suitable cuttings, and planting has, consequently, been deferred, in their cases, until next year. All of this work of plowing and planting was begun in February. A nursery company formed in San Francisco has 50,000 seedling orange trees in their nursery lot here which will be budded next fall. The company also purchased about 200 acres here which are to be planted in trees next season. Twelve miles of new ditching has also been made, with a capacity large enough to carry all the water that will ever be necessary to irrigate the entire tract. Water was turned into some of the ditches two months ago and the work of irrigation began. All of the trees thus far look thrifty, and now that water in abundance has been brought to them their success is assured.

Water Resources of the Company.

The company controls over 2000 miners' inches of water, which is conveyed 25½ miles in the Ophir Ditch from the north branch of the Feather river to Oroville. This is distributed through six subordinate ditches known as the Sycamore, Slaughter House, Planing Mill, Carpenter's Flat and Wyandotte, the latter delivering from Finletter, a distance of 16 miles, 500 miners' inches at Palermo. There are also about

five miles of branch ditches at Palermo. Five of the old reservoirs of mining days are being used by the company for catchment, storage and distribution.

In short, the water supply is abundant, buildings and other improvements are advancing as rapidly as lumber can be procured, and as Palermo is situated in the heart of the northern citrus belt, and the climate genial and healthy, there is no good reason why this settlement may not become as attractive in the northern, as Pasadena or Riverside in the southern portion of the State.

THE BIG RABBIT-DRIVE which is to come off at Pixley next Friday, June 1st, will "break the record," if those who have been engineering the project for several weeks past see their hopes realized. One of them, exhorting in the Delta, says: "Many are the pleasures of a rabbit-drive. There is scarce another sport of the field that equals it. You are doing more good to yourself than if you stayed home and worked all day, and you are doing just as much good to a hundred neighbors and to the county at large. * * * Remember that there will be a barbecue with plenty for all to eat, and plenty of lemonade to be hauled around in a wagon and ladled out free to thirsty walkers. Those who have never attended know what fun it is, and those who have never seen a drive will now have a chance to see a big one."

THE appearance of a large California lion in the neighborhood of San Gabriel occasioned considerable excitement recently. He was seen by several parties and an unsuccessful hunt was made for him.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE! FERTILIZE! NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.
Dr. J. KOEHL—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.96 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.96 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. KOEHL, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully, E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

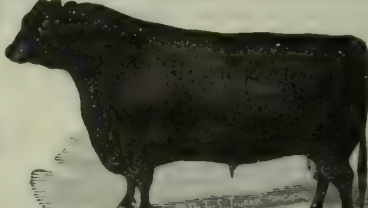

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

SANTA CRUZ COUNTY.

Address, H. MEYRICK, Box 5, Santa Cruz, Cal.

The supply of seasonable vegetables continue to increase, causing a weaker market. The weather is all that can be desired by gardeners. In peas, canners are still buying. Cheap lots of asparagus they

do not let pass either. Tomatoes and also green corn are beginning to come in more freely. The crop of these two will be larger than last year. Cucumbers, and, as for that, all other garden truck is gradually settling to lower prices.

Potatoes were steady up to Tuesday, when they temporarily strengthened, owing to some kind of religious Portuguese holiday on Monday. The demand for large, choice, well-matured potatoes is good, but inferior are only saleable at low prices.

In onions, there is nothing new to report. As the quality improves, so does the demand. As yet, very few are suitable to meet distant orders with.

Miscellaneous.

Hops are without change. The crop prospects are said to be good.

In wools; trading continues light. Receipts are backward probably due to the unsatisfactory market. The wool-buyers' organization or trust at the East is still depressing the market, using any means to keep prices down. They used the tariff humbug until it got too thin, for even the dullest wool-grower soon saw through it, now they are devising other means to keep American wools down. In our market holders of desirable grades are not pressing the market, but are firm in their views.

Continued receipts of live poultry from points on the Missouri river cause our market to rule lower.

Beans are steady. Eastern advices report a stronger tone owing to weak holders having about sold out.

In provisions the tone is stronger for both lard and meats in sympathy with higher prices at the East.

Choice varieties of apricots are beginning to make their appearance in the market. Ripe peaches will soon commence to come in; green are now in the market. Apples are still poor and consequently sell slow.

In dried fruits the market is slow, but then stocks are low and about cleaned up. The new crop will come in on a ready market.

Raisins are in light stock. The outlook is of the most flattering character for a large crop this year. The frost season has been passed and the only danger ahead is hot winds.

The tonnage movement compares with last year at this date as follows:

On the way.....	1888.	1887.
On the way.....	437,863	265,517
In port, disengaged.....	55,700	110,547
In port, engaged.....	9,989	7,818

Totals..... 503,549 383,882
To obtain the carrying capacity, add 60 per cent to the tonnage.

Tonnage on the way to Oregon, 15,077; tonnage at Portland, Oregon, loading and to load, 19,114. Total tonnage, 34,191.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Ertel's Victor Hay Presses.

The following letter to George Ertel from his son, who is now in Southern California, explains itself:

GLINDORA, CAL., May 19, 1888.

My Dear Father:—I returned here Sunday morning from Banning and left on the early morning train for Santa Ana Monday morning, as Mr. Burdick had sent a telegram for me to come Monday morning sure, and it was a good thing that I got finished at Banning in time to meet his commands as he was in an awful stew about the presses, and had telegraphed Zeimet here during my absence to know if they had been shipped. The two presses at Banning Mr. Thayer and I set up and started in one day, Saturday, and, as usual, the parties were highly pleased with them. Mr. Thayer's partner telegraphed him at Banning to see a party at Beaumont Sunday, and he wrote me since that he sold him a press, and that he has only two presses left out of the carload. He thinks he will get out of presses before the second car arrives.

Well, at Santa Ana I had a picnic with the Whitman agents. They had an ad. in the Santa Ana paper, challenging and defying competition against the celebrated Whitman hay press, so I and Mr. Burdick in person went down to their office and invited them to bring down a Whitman press and work it alongside the Victor, and agreed to allow them the use of our team and hay, but they positively refused to accept, saying they did not have the time, and, furthermore, they did not have to work their presses alongside the Victor. Mr. Burdick got quite indignant at this, and told them they better take down their bills if they did not want to do as they advertised. We persuaded several other men to go down and try to have them bring down a Whitman press, but they would not, and said they might have sold some presses if they had got theirs in before the Victor was introduced. They tried to get a man by the name of Price, from Austin, Texas, to help set up and run a Whitman press, but he told them he could not do it and honestly tell people it was the best press, for he has run a Victor two years in Texas that he bought from Walter Tips, baling and loading a car of hay per day with it; says he baled 900 cars (but I think he made a mistake in the amount), and the press has not cost him 5 cents for repairs. He says all the Dederick and Whitman presses are lying idle in his neighborhood, and he himself has a Dederick press that he will sell for \$20. There was one Whitman in use at Santa Ana last year, but it broke down several times when they tried to bale wet hay with it in the morning, as you know it gets very foggy down there in the morning. A man who had some baling done by this Whitman said they never could start up before nine o'clock in the morning, until the hay got rather dry, as they were afraid of breakages.

Truly, your son,
CHARLIE.

REMEMBER.—We can make it an object for some friend going East to consult us before buying tickets.

ALTHOUGH there are nearly 70,000 idle men in New York, immigrants continue to pour in by the shipload.

“PLANO” TWINE BINDER

IS FAMED FOR ITS

LIGHTNESS, DURABILITY, SIMPLICITY and CAPACITY.

GRAND AUCTION SALE!

Of 5 and 10 Acre Lots in Subdivision No. 2, with Town Lots and unsold Colony Lots in Subdivision No. 1, at

IRVING HALL, No. 139 Post Street, San Francisco,

SATURDAY, JUNE 2, 1888, AT 10 O'CLOCK A. M.

PALERMO!

The Riverside of Upper California. A Gem Colony, Surpassing all others in Fertility of Soil, Beauty of Landscape and Abundance of Pure Mountain Water.

The Palermo Colony, consisting of 6,900 acres of the choicest Fruit Lands in the State, is situated in Butte county, California, in the heart of the Northern Citrus Belt, 170 miles north of San Francisco and 5 miles south of Oroville, on the line of the Northern California Railroad. At the town of Palermo there is now a depot and warehouse, with side-tracks and railroad switches, and within a few weeks a Postoffice and telegraph station will be established.

SOIL AND TOPOGRAPHY.

The soil is a rich red and black, gravelly loam, the adaptation of which to all sorts of fruits has been fully established. Over one-third or more of the tract, including nearly all of Subdivision No. 1 and every part of Subdivision No. 2, is perfectly level. The remainder consists of gently rolling hills and valleys, where are sites for lovely homes and picturesque villas. Scattered over the Tract are giant live and white oaks and pretty groves of smaller trees.

A Merchant and Still a Fruit Grower.

A most attractive feature of the Palermo Colony is the splendid system adopted by the Palermo Land and Water Company for planting and caring for the groves and orchards of non-residents at actual cost, thus enabling those who cannot well give up their business or occupations to still engage in the profitable enterprise of fruit growing. While a number of most desirable settlers have located at Palermo and are caring for their own little farms, the Company, under the supervision of the Horticultural Superintendent, H. H. Hunting, has done a vast deal of work for purchasers living outside of the State, many of whom will build handsome residences on their tracts and spend a greater portion of the year among their beautiful groves of oranges and other fruits.

Thirty Thousand Dollars Spent in Cultivation.

During the season just passed within which trees could be planted—since the formation of the Palermo Colony—nearly 25,000 trees (mostly orange trees three or four years old, of the finest varieties) have been set out, in addition to which the Palermo Nursery and Citrus Association has 30,000 more in its nursery to meet the demand for next season. Orders were given for double this amount of work, but owing to the lateness of the season it was deemed inadvisable to attempt to do any more planting. Seven and one-fifth miles of picket fences were built. Twenty-four miles of main and distributing ditches were dug, enlarged and cleaned. The system of irrigating through ditches is, however, only temporary, and was adopted to meet the present demands. By next season the company contemplates having pipe lines laid throughout the colony and townsite, and great reservoirs will furnish abundant water for every purpose.

TOWN LOTS!

The town of Palermo must of necessity be a place of considerable importance. Its situation in the midst of a district yet in its infancy of fruit culture, though destined to become a great and growing one, and possessing splendid railroad facilities, with the almost certain prospect of being on a new overland route through the Beckwith Pass, makes an investment there a safe and profitable one. The lots, which are perfectly level, are all 50 feet front and have a depth of 150 feet, except those fronting on Railroad avenue, which vary from 117 to 180 feet.

Lots in Alternate Blocks Only Will be Sold.

\$3.00 from San Francisco.

\$1.00 from Sacramento.

50 cents from Marysville.

TIME TABLE.

Leave San Francisco, 7 A. M.; Sacramento, 10:30 A. M.; Marysville, 12:30 P. M. Arrive at Palermo, 1:30 P. M. Grand picnic at Palermo, where excursion will remain until 5:30 P. M., leaving for Oroville at that time. Leave Oroville at 6 A. M. Thursday, May 31st; arrive at San Francisco about noon.

TICKETS should be procured before the morning of departure, as only a limited number will be sold that day. Tickets for sale, maps and catalogues at the office of

Oroville, Cal.

AND FROM OUR REPRESENTATIVE AT THE DEPOT AT MARYSVILLE, WEDNESDAY, MAY 30TH.

A RESUME OF FOUR MONTHS OPERATIONS AT PALERMO.

On the 9th day of last January the first subdivision of the Palermo Colony, called Subdivision No. 1, and consisting of about 1800 acres of land, was put on the market. The sales which immediately followed have been steadily and continuous, although unaccompanied with any excitement or appearance of a boom. About three-fourths of this subdivision, apart from the townsite, has been sold to bona fide purchasers and settlers, as the catalogue map will show, and where the lots are large enough to admit it the name of the purchaser appears on the same. The prices obtained range from \$75 to \$250 per acre, being regulated entirely by the distance from the depot.

Eight and one-half miles of street grading has been done, and after the winter rains this work will be resumed, until throughout the colony the avenues and roadways will surpass those of Golden Gate Park. This work has given steady employment to 257 men.

IMPROVEMENTS.

Quite a number of good, substantial dwellings have been erected at Palermo, and but for the scarcity of lumber (something never before known in this splendid lumber district) others would have been built. A planing mill, which will employ from 30 to 40 men, is in course of construction, and a large hotel will be built by the Company and ready for occupancy the coming fall. It is intended to make this hotel the finest in Northern California, creating at Palermo unprecedented attractions to visitors, tourists and seekers after health in this great sanitarium.

SUBDIVISION No. 2.

Subdivision No. 2, lying along the railroad and immediately adjoining the townsite of Palermo, is as pretty a piece of perfectly level land as can be found in California to-day. It may truly be called the cream of the Palermo Colony. It shares every advantage that Subdivision No. 1 possesses, and its value, present and future, is established beyond peradventure. It comes as an offering to the public when this enterprise is no longer an experiment. Purchasers will have the assurance that no future subdivision can compete with it; since this is the only public sale that will ever be made of Palermo property, the inducements to at once accept the opportunity are unparalleled in the history of real estate transactions.

It will be the Last Subdivision Offered With Free Water.

PACIFIC RURAL PRESS

TWENTY-PAGE EDITION.

Vol. XXXV.—No. 22.

SAN FRANCISCO, SATURDAY, JUNE 2, 1888.

SINGLE COPIES, 10 Cts.

A Distinguished Aberdeen-Angus.

We have the pleasure of presenting on this page something grand in form, striking in pose

braska. This animal was winner of the grand sweepstakes over all ages and breeds at the Kansas Fat-Stock show of 1887; the *Breeders' Gazette* Challenge Shield for the best animal

herd of *any breed*, at the same shows. In addition, Black Prince was awarded 16 special premiums, alone winning in two weeks over \$2000. At the Chicago and Kansas City Fat-

The steer, "Black Prince of Turlington 2d," defeated all comers by "killing out" 70.77 per cent of net to gross meat, being a greater per cent than that of any other steer slaugh-

BLACK PRINCE OF TURLINGTON.

and forceful in spirit—a portrait of the greatest black polled steer which ever came to the block in America—the two-year-old, pure-bred Aberdeen-Angus Prince of Turlington 2d. He was the property of T. W. Harvey of Chicago, whose breeding farms are at Turlington, Ne-

braska, fed and bred by exhibitor, and of the sweepstakes for best two-year-old steer of any breed. He was also at the head of Mr. Harvey's herd, and won not only first premium for best Angus herd at both Chicago and Kansas City, but of the herd that won grand sweepstakes for best

Stock Shows of 1887 his winnings and that of the herd of which he was a member amounted, in two weeks, to \$4,435.50.

On the block at Chicago the four premiums offered were given Scotch cattle; two of them won by Mr. Harvey's Angus steers,

tered. He was closely pressed in this case, as he had been many times before, by his stable companions, "Sandy," champion steer of Kansas City, 1886, and "Pontiff," sweepstake two-year-old of Kansas City, 1887, they netting 70.67 per cent and 69.77 per cent respectively,

HORTICULTURE.

The Future of Citrus Culture in California.

[The following paper by L. M. Holt, editor of the *Riverside Press*, was read at the California Fruit-Growers' Convention, which convened at Santa Barbara on April 9th, under the direction of the State Board of Horticulture.]

The question of where oranges can be grown is one that has attracted the attention of the fruit-growers of California to a great extent during the past few months, and this question is intimately connected with the future of citrus culture in the State. There is one idea, I think, that has been entirely overlooked by the public discussions of this question, and that is, that more attention has been paid to the subject of where the orange tree can be grown than to where the orange fruit can be raised.

California is subject to cold waves during the winter time. There is particularly no portion of the State that is free from the cold wave. The question of average temperature cuts but little figure in orange culture, only as the question of minimum temperature is satisfactory. A cold wave that will destroy the crop will not materially injure the tree. Therefore the locality where the tree can be successfully grown might have such a minimum temperature that the orchard would never fruit in a profitable manner. A cold wave that would do no damage to the tree and no damage to the fruit in January, might ruin the crop if the same temperature should come in November, before the orange is sufficiently matured to resist the cold.

In November, 1886, a cold wave swept over Riverside, which sent the thermometer down to 27°, a point which would only cut back the tender shoots of the tree, and practically it would not injure the tree at all; and yet, the fruit in its immature state at that time was seriously affected. Of course, the mercury in different localities registered a different degree, but at that time there was probably no orange in the valley that was subjected to a lower temperature than 25°.

During the past winter the celebrated cold wave which swept all over the State, put the mercury down to 25° in Riverside, two degrees lower than the cold wave of 1887, and yet no damage was done, because the condition of the tree and fruit was such as to withstand the cold better in January than in November.

In neither one of these cold waves was there any damage done to the orchard. In fact, the mercury could have gone several degrees lower than it did and yet the trees would have sustained no injury of a permanent character.

The question, therefore, for the practical fruit-grower to study is to find the locality for the planting of the orange where the minimum temperature will be high enough to save the fruit as well as the tree.

There are a few propositions of a general character which are now recognized in connection with citrus fruit culture in California. One is, that the best localities for perfecting the orange and lemon are located away from the coast, in the interior valleys of the State. Wherever the orange has been grown, from Oroville to the Mexican line, every bearing tree, wherever located, has been a witness to testify to the correctness of this proposition. As a rule, all orchards located along the coast have been attacked by the common black scale, accompanied with the black smut or fungus growth, and every orchard located in an interior valley, as a rule, has been free from both. The one invariably accompanies the other, the black smut being the result of the black scale.

The same rule does not hold true as regards some other insect pests. The red scale and the cottony cushion scale are to be found in some central portions of California where the brown or black scale does not exist, although in Southern California it has been confined thus far to the coast valleys.

The markets of the United States demonstrate the fact that the oranges raised in the central valleys command higher prices than those raised along the coast. These interior oranges command a higher price in Chicago than any oranges shipped to that market from any portion of the world. It was these oranges, grown in the interior valleys, that competed successfully with Florida, and secured the gold medals for the best 20 varieties grown in California, in the United States or in the world. In making this statement I do not wish to reflect in the least upon the magnificent display of oranges from San Diego county at the New Orleans World's Fair. It is a well known fact that the line which separates the interior valleys from the coast valleys, so far as the citrus fruits are concerned, nears the coast as we progress southward toward the Mexican line, and that only a few miles back from the ocean, in San Diego county, we find as clean fruit as we do farther north, twice or three times that distance. It is also true that on the very coast, in San Diego county, clean orchards can be grown for many years, although eventually the scale, as a rule, gets possession of the trees. Hence, we find around the bay of San Diego very fine oranges grown on young trees. This does not conflict with the general rule which places the home of the orange, in California, away from the coast.

The time is coming when trainloads of oranges from California will be shipped across

the Rocky mountains, where now only carloads are sent. It is only about three years since oranges were first shipped successfully from Southern California to Chicago. It was then an experiment; a market had to be made in the Western States. It took time to make it, and yet the market has extended more rapidly than the bearing capacity of our orchards, and there has never been a time since the shipment of oranges on a large scale to the Western States commenced when the demand for good oranges did not exceed the supply. And yet the markets of the Northwest are only partially developed, and the East has not been touched at all.

We do not come in conflict with Florida in the orange markets of the North, because the Florida crop is marketed before the California crop is ready to market. Our shipments begin about the first of February, and at that time theirs is practically ended. The Florida crop of oranges comes into the market about the first of November, and continues for four months. The California crop commences about the first of February and continues about four months. Florida has the disadvantage of placing its fruit on the market during the four coldest months, at a time when the public do not appreciate acid fruits. The California crop comes upon the market in the spring, when the system demands an acid fruit, and at a time when there is practically no other fruit in the market with which it is brought into competition.

It is for this reason, and for another reason of actual superiority, that the California orange commands from \$1 to \$2 per box more in the market than is paid for Florida oranges.

As yet the supply of the California orange is not equal to the demand, and the supply is not increasing as rapidly as the public generally think. Orange-orchard planting has practically ceased for several years past along the coast valleys of Southern California, while it has received an impetus in the interior valleys during the past three or four years. There has been practically no increase of production of oranges in the coast valleys, and it is doubtful if there ever will be an increase in those sections. Hence, we must look to the interior valleys for the orange supply of the future. This supply, at present, comes from a limited area, and the future increase of oranges from those valleys will be slow, because it requires so many years to plant the orchard and bring it into bearing. Riverside illustrates this point very nicely, as is seen from the shipments from that valley during the past four years.

During the season of 1884-5, the shipment of oranges from Riverside amounted to 500 carloads.

During the season of 1885-6, the shipments were about the same.

During the season of 1886-7, the shipments did not reach 500 carloads.

During the present season, 1887-8, the shipments to date have reached nearly 500 carloads, with probably 200 or 300 carloads yet to go forward.

The total shipments of oranges from Southern California are not a great deal larger to day than they were four years ago, and yet while the increase is slow, it is certain, and in the four years to come we may look for a larger increase than in the four years past, because more young orchards will come into bearing.

The question of raising a superior orange in California is now settled. This State not only raises a superior orange, an orange that is king among oranges, but that fact is recognized by the markets of the United States, and there is no probability that the present century will see enough oranges produced in California to supply the spring markets of the Atlantic States. The Mediterranean orange is being practically driven from the market, while the Florida orange cuts no figure, as it is not a competitor.

Our people are learning rapidly where choice oranges can be raised successfully. Fortunes have been lost in learning this lesson, and other fortunes, probably, will also be lost in trying to demonstrate the fact that the California citrus belt is a large one. A few will pay heavy tuition to learn these facts, and the masses will take advantage of the facts thus learned.

Cultivation of the orange in favorable localities is probably the most profitable business to which an acre of ground can be devoted for horticultural and agricultural purposes. It takes time to develop an orange grove, and this fact, taken in connection with the fear of overproduction, keeps the masses from going into the industry, and hence the time when overproduction will come, if ever, is pushed far into the future.

The price of choice orange land in California is yet very low, as compared to the price it must attain when this industry and the markets become fully and thoroughly established. Riverside to-day has 3000 acres of orange groves, which will produce next year one carload to every three acres, and this crop will increase from year to year until an average crop of two carloads to the acre is reached, or 6000 carloads from the 3000 acres. The crop of these 3000 acres next year will pay \$200,000 in freight, an average of \$66 to the acre, and when the trees are in what may be called full bearing, they will pay freight at the rate of \$600 an acre, if the freight rates continue as they are to-day—\$200 a carload—while the average net income of the crop now is \$300 an acre, and similar markets which have prevailed here for the last three years will pay, when the trees come into full bearing, six times that amount, or an average of \$1800 an acre, this being reckoned as the net price of the crop upon the tree.

In fact, single orchards are now yielding that income.

I did not intend to make this paper a document for booming California, but a discussion of the future of citrus-fruit culture that left out the question of dollars and cents would be incomplete.

While I am sanguine of the future profits of orange culture, I cannot say so much for the future of the lemon business, and as this portion of the industry is as yet in its infancy, but is being developed in a satisfactory but very slow way, I only give that part of the subject a passing notice.

The very best of lemons can be raised in California. They will ripen, however, at the wrong season of the year, and the only question now for our people to ascertain is, how can the lemon be picked in December and marketed in June.

Sun-Scalding of Trees.

EDITORS PRESS:—State Inspector Klee's article in the last PRESS on the above subject is timely and right to the point. Fruit-growers cannot be too often reminded of the necessity of guarding against the injury from sun scalding in this warm climate. The rapid growth of the tree and the tendency to shoot up long slender limbs, exposing a large surface to the scalding sun, renders them peculiarly liable to injury from this cause. The preventives he recommends are good, as I know from long experience. Shading the young trees with a shingle, white-washing the exposed bodies and limbs of all trees with a common lime whitewash with a little salt added, will not only reflect the heat, but effectually clean them from the woolly aphids and the scale. I have whitewashed two orchards in my immediate vicinity for two seasons and the bark presents a smooth glossy appearance, and they are entirely free from insects though previously badly infested.

Keeping the tops of trees low down, encouraging the growth of a dense foliage for shade, is also an excellent preventive.

Mr. Klee seems to convey the idea in his "Physiological Reasons" that the sap ascends through the bark or between the bark and wood. Not so, however. The sap ascends by capillary attraction through the pores of the outer layer of wood, called the albumen. At the East it was customary in an early day to girdle, or "deaden" the oak and other trees on the openings, and sow to wheat, without any further clearing than the small undergrowth. Every woodchopper knows very well it was necessary to cut into the wood in order to deaden the tree. Even the little "sap sucker" knew from instinct that it was necessary to peck into the wood to produce the flow of sap.

After the sap has ascended and performed its functions of developing the leaf and fruit buds, a portion descends between the bark and wood to form an annular layer of wood. No doubt the damage is done at or about this time when the sun comes out in all his fervid vigor, and bakes and burns the bark to such an extent as to unduly heat the sap, and thus deprive it of its vivifying principle. I cannot understand how the sap can become soured, unless perforations, as Mr. Klee intimates, are made to admit the oxygen of the air, which is necessary to acidity. J. S. TIBBITS.

Santa Rita.

DATE-PALM FENCES.—We have avenues of date-palms in this State, notably the one on Col. Hollister's place at Santa Barbara, but we are not aware that any one has tried setting the plants closely enough together to form a fence or hedge, and yet this has been done in Florida, and a writer in the *Dispatch* of Jacksonville, says: "Mr. J. C. Thorpe of Sanford, then of Orange City, some ten years ago, transplanted into a row some little date-palms he had, and now they are something like two feet in diameter and ten feet high. No animal could get through the line. Their exquisite, creamy white blossoms have appeared for one or two years past. Think what a sight a close row of those palms would be, one pushing this way, another that, in the upward struggle for light and air." It would be easy to try it in this State. All it needs is patience to wait for them to grow. The plants can be easily secured in quantity by planting the seed of the dried dates of commerce in boxes of sandy soil. If kept moist, they germinate readily, and in the warmer parts of the State they grow quite rapidly. They should be potted off separately and planted out a year or two later.

FLOWERS IN WATER.—At a recent horticultural meeting flowers were exhibited in a glass filled with water and fitted with a wide and flat stopper. To the stopper the flowers were attached and then carefully introduced into the water in the globe, the stopper completely filling the mouth of the globe and being wide enough to stand safely. By turning the whole arrangement so that it stood on the stopper, the flowers were left completely surrounded by water. The water magnified the flowers, and a pleasing optical illusion is the result. Flowers thus immersed will keep twice as long as those in the air.

GENERAL CHIPMAN of Red Bluff has accepted an invitation to deliver the annual address before the San Joaquin Valley Agricultural Association at the District Fair to be held in Stockton next fall. The General is reputed to be a deep thinker and accomplished speaker.

THE STABLE.

New Running Stakes by the State Society.

The *Record-Union* has the following: "The desire of many breeders and owners of thoroughbred horses to return and race on this coast after the closing of what is called the Western circuit, i. e., Louisville, St. Louis and Chicago, and to encourage the continued increase in the breeding of this class of horses, has induced the Directors of the State Agricultural Society to offer three rich stakes for two and three-year-olds, to be run at the State Fair of 1889, and two three-year-old stakes to be run in 1890.

These events, with one exception, are for entries of colts in their yearling form. The exception is for two-year-olds, in order that there may be a large stake for three-year-olds in 1889.

These events will be continued and others added each year, so that after a few seasons nearly all the principal running events for the State Fair will have closed while the colts are yearlings, thereby placing all on an equal footing, so that superior breeding and proper training shall be the test at the age named in these events. This plan has built up and made valuable stakes in nearly every State East; whereas if they waited until the colts were tried, the entries would have been 50 to 60 per cent less. These stakes are so arranged as to permit declarations at stated times, at such figures as will permit the withdrawal of a colt for a small payment, all of which swells the fund.

This system is what has made young horses so valuable, as the stakes to be run for are growing with the animal, as it were, and, with the added money, gives the fortunate owner of the winner a handsome return for his investment. Then, in addition, colts entered in such events outsell those of the same breeding that have no engagements. The stakes opened for 1889 are as follows:

No. 1.—The California Autumn Stakes.—A sweepstakes for two-year-olds (foals of 1887), to be run at the State Fair of 1889; \$50 each, h. f., or only \$10 if declared on or before January 1st, or \$15 by May, 1889. Declarations void unless accompanied by the money; with \$500 added, of which \$100 to second; third to save stake. Winners of any stake race to carry three pounds; of two or more, five pounds extra. Maidens allowed five pounds. Three-quarters of a mile.

No. 2.—The California Annual Stake.—A sweepstakes for two-year-olds (foals of 1887), to be run at the State Fair of 1889; \$100 each, h. f., or only \$10 if declared on or before January 1st; \$15 by May 1st, or \$25 by August 1, 1889. Declarations void unless accompanied by the money; with \$600 added, of which \$150 to second; third to save stake. Winner of Autumn stakes to carry seven pounds extra; winner of any other stakes to carry three pounds; of two or more, seven pounds extra. Maidens allowed five pounds. One mile.

No. 3.—The California Breeders' Stakes.—(To close in two-year-old form this time only.) A sweepstakes for three-year-olds (foals of 1886), to be run at the State Fair of 1889; \$100 each, h. f., or only \$10 if declared January 1st; \$15 by May 1st, or \$25 by August 1, 1889. Declarations void unless accompanied by the money; with \$600 added, of which \$150 to second, \$100 to third. Winner of any stake race in 1889, of the value of \$1000, to carry five pounds; of two or more, ten pounds extra. Maidens allowed five pounds. One mile and a quarter.

For 1890:

No. 4.—The California Breeders' Stakes.—A sweepstakes for three-year-olds (foals of 1887), to be run at State Fair, 1890. (Conditions same as No. 3, except as to year.)

No. 5.—The President Stakes.—A sweepstakes for three-year-olds (foals of 1887) to be run at the State Fair in 1890. One hundred dollars each, of which \$5 must accompany the nomination; \$10 payable January 1, 1889; \$15, January 1, 1890; \$20, May 1, 1890; the remaining \$50 the day of race. Payments not made as they become due forfeit money paid in, and declares entry out; \$750 added. The entire stakes and \$500 of the added money to winner; \$150 to second; \$100 to third. Winner of Breeders' stake to carry seven pounds; any other three-year-old stake of the value of \$1000, five pounds; if two or more, seven pounds. Maidens allowed five pounds. One mile and a half.

The offering of these stakes will cause horses that have engagements therein, and at the Pacific Coast Blood-Horse Fall Meeting, to return after running in the Western Circuit in May and June. Engagements in these events will insure the attendance of a large field of horses that will fill other races, thereby increasing the number of starters each season; and the class of horses that will take part will have much to do with placing our racing on such footing as to merit the indorsement of the public. California is fast assuming the lead in the breeding of thoroughbred stock, and the action of the directors of the State Agricultural Society in this additional encouragement is commendable in the extreme.

The entries to these stakes will close with the regular program on August 1, 1888.

THE VETERINARIAN.

The Functions of the Stomach in Ruminants.

EDITORS PRESS:—Whatever pleasure the aspirant to a knowledge of veterinary science may receive from the study of the physiology of digestion in the horse, when he becomes acquainted with that of the ruminant (animals which chew their cud) he must be struck with the superior claims it has to be considered as one of nature's most beautiful works. Here a wide and luxuriant field is open to him for research, and his investigation is sure to be attended by the acquirement of knowledge, interesting and important. The consideration of a structure, so complicated, yet so beautifully adapted for the functions it has to perform, must fill every thinking mind with admiration and wonder. The first difference of structure we perceive from that of the horse, as it regards their digestive organs, is that the ruminant has no incisor teeth in the upper jaw, their place being supplied by a densely fibrous and highly elastic pad (dental pad). By means of the teeth in the lower jaw and the pad in the upper jaw, assisted by the lips, which are more muscular, harder and firmer in texture than those of the horse, the herbage is partly cut, partly torn up by the roots; it is slightly or scarcely at all masticated, but is mingled with the saliva, formed into a pellet and swallowed. At the base of the oesophagus (gullet), however, there is a great peculiarity of structure. As it approaches its termination, this tube enlarges and becomes thicker and stronger in its walls, and when it reaches the stomach it abuts upon two powerful muscular pillars, which, when open, leave a passage of communication between the gullet and rumen (first stomach) and also with the reticulum (second stomach); and, when shut, they form the floor of the oesophageal canal which leads on to the third and fourth stomachs. I will consider the physiology of this structure when I have explained that of the stomachs, which are in the ruminant four in number, viz., the rumen or paunch, the reticulum or honeycomb, the omasum or manifolds and the abomasum or true digestive stomach.

The rumen is the largest of all the stomachs. It is situated on the left side of the cavity of the abdomen, extending from the diaphragm to the pelvis, its inferior surface resting on the floor of the abdomen and its superior one being in contact with the left flank. It is divided by a large muscular band into two distinct sacs, and these are again subdivided, thus forming four compartments. These separations are for the purpose of retarding the food in its passage through the rumen, so that the process of maceration may be more effectually carried on. The rumen is composed of four coats, an external peritoneal, a muscular, a glandular and an internal cuticular. The internal coat is studded with numerous papillæ, which are most developed at the center of each compartment. They are erectile, and are for the purpose of protecting the follicular glands beneath them from being injured by the food as it passes over them. They also assist in retarding the food and in mixing it with the mucus alkaline fluid which is secreted by these glands. There are two openings into the rumen, one through the two pillars communicating with the oesophagus and the other (which is guarded by a valvular fold of the rumen, running obliquely across it) leading to the

Second Stomach

Or the reticulum. This stomach is situated anteriorly and rather to the right side of the upper left sac of the rumen and between it and the diaphragm. It is, I believe, considered to be the smallest of the four stomachs, and is composed of the same number of coats as the rumen, differing from it only in that its internal coat consists of numerous wide and shallow cells, which present a beautiful network appearance. On their sides and in their centers are developed innumerable papillæ which have undoubtedly a secreting or secreting function. It has two openings into it, one which I have already mentioned from the rumen, and the other through the posterior part of the two pillars communicating with the oesophagus.

The Third Stomach

Is situated posteriorly to the second, between the liver and the right sac of the rumen. It is of a most peculiar but beautiful structure, consisting of a series of folds or plaits, which are arranged in a perfect and exact order.

Thus, a long fold hangs down from the roof of the stomach, floating freely within it, and reaching down to its floor; on each side of this is another lesser one, and beyond that another, until the last one is very small. Then commences another group similarly arranged; this is followed by a third, and so on, until the viscous becomes filled, or, as it were, made up of them. These plaits or leaves consist of a folding or double reflection of the cuticular coat, with muscular fibers interposed; on their external surface are developed innumerable small prominences, which are of a very hard, firm texture, and become more so as they approach near to the edges, where they assume a hook-like shape. They are most numerous at the anterior part of the stomach, where they are most

required, and least so at the posterior part which communicates with the abomasum or

Fourth Stomach.

The abomasum is the true digestive stomach, for it is here that the food, which has been prepared by the other stomachs, becomes mixed with the gastric juice, and is formed with chyme. It is of a conical form, the base being anteriorly situated. It is placed posteriorly to the manifold, and to the right of the right sac of the rumen. It is lined internally by a villous membrane, which is arranged in longitudinal folds. These are most developed in the anterior or wide part, and, generally, there is one more particularly so at the entrance into the manifold, allowing the free passage of the food from it to the abomasum, but entirely preventing its return, and thus discharging the function of a valve. The abomasum communicates posteriorly by its pyloric extremity with the duodenum (the first of the small bowels); and here its muscular coat becomes thicker and stronger and forms a kind of sphincter. It is more largely supplied with blood and with nervous energy than any of the other stomachs. A further consideration of the subject will be given in another article.

No. 11 Seventh St., S. F.

Swellings on Cattle's Necks.

EDITORS PRESS:—"Subscriber" wishes information respecting swellings in cattle's necks. I cured a very bad case a short time ago by the following treatment:

In the first stage of swelling, before coming to a head, bathe well with hot water every two or three days to soften and loosen it. After bathing rub dry and rub on plenty of raw linseed oil all around the swelling. Try around it with the tip of the finger occasionally to find a soft spot, and when one is found, that is the place to lance it.

If the soft spot is high up on the swelling, a small seton would drain it better. Take a small, smooth stick about half an inch in diameter. Insert the point (rounded, not sharp) in the place lanced first; press downward on the inside of the skin of the neck till well down to the bottom of the swelling; then cut a hole through the skin at the bottom of the stick, and insert a strip of cotton cloth greased with lard and knotted at each end. Move it up or down every day or two to keep it loose. A little raw linseed oil rubbed on will keep it soft and take away the soreness.

In the second or tumorous stage, when the swelling shows black and discharges offensive matter, take about a four-ounce bottle of carbolic acid, pure; pour about one ounce into an old saucer; take a small stick about a foot in length; tie a bit of sponge on the end and dip the sponge in the acid. Then push it in the wound where the matter shows; press it steadily in. Dip your sponge in the acid often. Press in in different places—it will burn the blood and matter wherever it goes.

Repeat the application every three days. Do not try to wash it, as water will not touch the burnt matter.

After using the acid the fourth time, letting it rest three or four days, take a small amount of crude arsenic—about one-quarter as much as will lie on a ten-cent piece—and an equal quantity of wheat flour. Mix thoroughly; then add two or three drops of water to the flour and arsenic, and mold into three or four small pills. Press the pills into the wound in different places. It will make the neck swell a great deal, but it will eat out the cancerous growth without any other care.

The arsenic is for the worst cases. Be careful not to use more arsenic than here stated, as it may cut further than intended.

G. M. BROWN.

Santa Clara May 24, 1888.

A HORSE SURVIVES A FEARFUL WOUND.—The Sacramento Bee of May 16th states that a valuable horse, on Mrs. Davis' ranch near Lincoln, was lately found to have sustained a frightful injury. There was a deep wound almost directly between the horse's eyes, and it was at first thought that he had been shot. The animal was brought to this city, however, and put in charge of a veterinary surgeon, who probed the wound and ascertained that the opening was closed by some hard substance. When the horse's mouth was opened, it was found that the object producing the injury had penetrated so deep that it formed a lump in the roof of the upper jaw. The surgeon made an incision at the surface of the wound, and inserted a pair of forceps, with which he took a firm hold on the hard object. By exerting all his strength, he was able to extract a piece of wood, over six inches in length, and nearly an inch in thickness. It was deemed certain that the injury would prove fatal, but it was decided to make an effort to save the animal. The piece of wood, the surgeon says, did not miss the animal's brain the sixteenth of an inch. An opening was cut in the horse's mouth, that all pus might flow therefrom, and the wound was washed out regularly and is healing nicely. The horse submits to the treatment without objection, and with almost human intelligence. It is now assured that the animal will recover with no further damage than the loss of one eye—a result regarded as extremely remarkable by horsemen. It is not known how the injury was received, but it is believed that the horse, while at play, ran violently against a projecting board.

POULTRY YARD.

Suggestions for Success.

EDITORS PRESS:—As I am in receipt of many letters seeking information of me in the matter of successful poultry-keeping, and while perfectly willing to impart all I know of it, I yet find it quite a task to answer them severally, and so think that probably a very good way would be to answer them through the columns of the RURAL, whence they obtained their knowledge of me as a poultry-keeper.

I will describe as well as I can a small poultry ranch that should be a successful one. For the locality in which I live and have fowls, I think I could do it with some assurance, but for all parts of the State it may not be so easily done, as one section is dry and hot, another moist and cool, or windy, or possessed of some characteristic making a different course of management necessary. But there are in all cases certain general rules to be observed which, if they are followed carefully and persistently, will result in most cases in success, and where they do not result satisfactorily one can generally, by careful observation, if his heart is in the work, see wherein the fault consists, whether in too much management in one direction or too little in another.

If fowls are yarded they should be allowed to have a run during the winter or early spring to freshen themselves up and get a pick at the young green feed and get insects and worms. Although this is not strictly necessary, as I have kept them yarded in small space (20 hens in a yard 16x16 feet, with the house 6x8 feet inside the yard) for nearly three years without change, simply keeping their houses clean, and their yards also clean and dug up, using also straw plentifully to help keep the yards and houses dry and comfortable. The houses at any rate must be dry, and if their yards are unavoidably wet during the winter, they will pass much of their time in their house, making extra care of the house needful. If then, after selecting with what judgment you may, your fowls, if you are obliged to yard them and are limited in space, do not put more than 20 fowls in a yard, say 16x16 ft., and make your house 6x8 ft., with two roosts running lengthwise of the house. Put the door in the end between the ends of the roosts. Place the roosts not more than two feet from the floor and make them of 2x3 scantling rounded on top. The floor may be of lumber or of dirt raised above the level of the outside ground. Some prefer to lay a brick floor, as the hens cannot scratch it up in dusting themselves. If this is done and the bricks are covered with dirt or sand, it is easily cleaned.

The houses should be made with an open space on each side of the bottom and as near the length of the house as possible. This opening should be about two inches wide for the purpose of ventilation; also the space between the roof and the sides and ends of the house should not be closed, and then you will have all the ventilation that is desirable. I have never found it necessary or advisable to have one side of the house latticed. On the other hand, I cover all the cracks in the sides and ends except the openings I have mentioned. Fowls should not be exposed to a draught unless you want to invite roup. The passage of the air through the sides of the house at the bottom carries all odors arising from their droppings away, while the openings at the top are sufficient for the passing off of the heated air and the entrance of fresh, and as the roosts are only two feet from the floor they are out of all draughts.

For nests, an excellent way is to make an opening on each side of the door, down near the floor, for the hen to pass through into a box with a hinged cover placed on the outside of the house and up against it. Then, without having to enter the house, you can, by simply raising the cover, get your eggs. Make the nests, say 12x16 inches and 12 inches deep, with straw, sawdust or loose dirt for them to lay in.

I find that for drinking vessels there is nothing better than bright, clean coal oil cans cut in two, lengthwise, each can making two vessels. I do not use anything that I cannot wash out each time. I give them fresh water, and during the hot days they should have fresh cool water twice a day, the water kept shaded from the sun. The same kind of vessel is good to give them their mash in. This you should mix for them each morning, of bran or shorts, or both, mixed with middlings. During the cold weather it should be fed while warm; in the warm summer weather it does not matter so much, but in winter they should have it early and hot. At night feed dry grain varying in kind, but not much corn in summer, as it is heating and fattens too much.

As to the fatness of fowls I don't think or find that it hurts them as layers to be as fat as they can be, if they are fed largely in green stuff of almost any kind, either beet or carrot tops, grass, corn, or watermelon rinds, or whatever one has to give them, but give them all they will eat clean and this is a good rule with other food.

One vitally necessary thing in their care is cleanliness. Keep their yards and houses, fences and roosts clean; use coal oil and white-wash freely inside and outside. Give your fowls a dust bath in their yards, of say three

parts dry dirt and one part ashes with sulphur. Provide them plentifully with ground or broken suitably, and coarse, sand or fine gravel. For only 20 or so fowls you would probably have scraps of meat and vegetables from the table sufficient for them. If not you can get cracknels in cakes and feed them chopped up twice or three times a week. Keep in this way carefully and watched closely I don't see how one can fail of success.

Lodi, Cal.

T. B. GEFFROY.

HOW TO PRESERVE EGGS.—Take a teacupful of salt, and lime the size of an egg, and pour boiling water on them. When cold, drain off the liquor and put it on your eggs. If too strong, there will be a crust on top; if so, add more water. This is for two gallons of liquor. There is no receipt that beats this, and it can be relied upon. Eggs put down in August and used in April are just as fresh and make just as nice frosting as newly laid ones.

THE DAIRY.

Testing Dairy Value of Cows.

As we shall probably ere long come to the adoption of accurate methods of testing dairy cows exhibited at our fairs, it will interest readers to see the "rules for dairy tests" [adopted by the Ayrshire Breeders' Association, for which we are indebted to the secretary, C. M. Winslow of Brandon, Vt.]

Believing that the value of a cow for the dairy is not only her ability to produce a large quantity of milk, but also her ability to convert the largest percentage of food into milk solids; also believing that due regard should be given to the cost of production, and that dairy tests at fairs and cattle shows should be so conducted as to bring out these points, therefore—

Resolved, That the Ayrshire Breeders' Association recommend the adoption of the following rules to govern milk, butter and cheese tests at all fairs and dairy shows, and thus by official tests give the awards to the breed or single animals that show their superiority as profitable dairy cows:

Rules.

- 1st. A statement as to when the cow dropped her last calf, date of last bull service since calving, method of care, treatment and food since last calving, of kind and quantity of food in full consumed for 10 days previous to commencement of the test, must be made under oath.
- 2d. For each 10 days since calving..... Points.

" " 30 days of gestation.....	2
" " every pound of milk given in 24 hours.....	1
" " " butter from 100 lbs. of milk.....	10
" " " cheese curd from 100 pounds of milk.....	5
- In all..... 19
- 3d. Cost of product to be taken into account in making the award upon the following scale, viz.:

For every 10 cents cost for 100 pounds of milk over \$1 per 100 pounds, deduct.....	2
For every 10 cents cost for 100 pounds of milk under \$1 per 100 pounds, add.....	2
For every 1 cent cost for one pound of butter over 20 cents per pound, deduct.....	2
For every 1 cent cost for one pound of butter under 20 cents per pound, add.....	2
For every 1 cent cost for one pound of cheese curd over 10 cents per pound, deduct.....	1
For every 1 cent cost for one pound of cheese curd under 10 cents per pound, add.....	1
- In all..... 10
- 4th. Quality and chemical analysis of butter and cheese curd to be taken into consideration in making the award.
- 5th. Cows to be fed, milked and cared for by competent persons satisfactory to owners, and selected by and under the personal supervision of the superintendents. Food consumed during the test to be of such kind and quantity as the owner may designate. The food to be charged at cost price to the owner.

BUY A HORSE THAT IS INTELLIGENT.—The Boston Post says that in selecting a family horse the first requisite is intelligence. If the animal be intelligent he is pretty sure to be safe, whereas even a gentle horse who is stupid is always a source of possible danger. He may be so lazy and lifeless that the most timid woman would not fear to drive him, and yet if he lacks mind he will be pretty sure to kick the carriage to pieces or run away whenever anything breaks. On the other hand it is almost impossible to scare a really intelligent horse. He may be disconcerted or alarmed, but he won't lose his head. It is, however, astonishing how little interest in this all-important question of intellect the usual horse-dealer takes. The reason probably is that he feels perfectly competent to manage any horse, no matter what the animal's character may be, and he regards him simply as a beast of burden and not in the least as a companion or a friend. An acquaintance of mine sent a very shrewd jockey to Kentucky for the purpose of selecting a saddle-horse. He brought back a handsome animal, thoroughly trained and perfectly satisfactory to his new owner, but anybody who had studied horses' eyes would have seen at a glance that the high priced "saddler" was a fool; and so he turned out to be, for he was easily frightened, and he finally ran away and had to be sold in disgrace.

IMITATION IVORY.—Much of the so-called ivory now in use is simply potato. A good sound potato washed in diluted sulphuric acid, then boiled in the same dilution, and then slowly dried, is all ready to be turned into buttons, poker chips and innumerable other things that ivory was used for once upon a time.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The Farmer's Trust.

We briefly noticed the convention held at Topeka, Kansas, early last month, to form a farmers' trust, and the subsequent filing of a charter for "The Farmers' Federation of the Mississippi Valley," with a capital stock of \$20,000,000 in shares of \$10 each.

The Kansas City *Democrat* has published an account of an interview with the acknowledged father of the movement—Hon. Walter N. Allen, of Meridan, Kansas—extracts from which will give a fair notion of the proposed ends and methods of the new organization. Mr. Allen said:

The beef, hog and grain trusts have taught the farmers how to protect themselves. * * * The Legislature can give us no relief, and we can gain nothing by denouncing these trusts. The remedy is in our own hands, and if we fail to apply it we deserve to be slaves.

It is our plan to appoint agents to sell our produce, and local agents to gather it together and to ship it to the various markets; to create an executive board and a bureau of statistics which shall collect crop reports, regulate shipments and establish prices. We may have an over-production, but, by keeping the surplus off the market, we can always maintain fair prices for what there may be a demand for.

Of course it will take a very large amount of money to put this plan into practical operation, and we expect to raise the operating expenses necessary in this way—incorporate the trust, with a capital stock of \$20,000,000, to be issued in \$10 shares, \$10,000,000 of the stock to be held in reserve, and \$10,000,000 to be sold to actual farmers and stock-raisers, at 50 cents or less on the dollar. The stock is to be proportioned to the respective States and Territories according to their farming population and productive power, and equally distributed in counties, townships or districts. The money received in this manner will be used in inaugurating the Farmers' Trust.

The agents, who will be appointed at Kansas City, St. Louis and other commercial points to sell our produce, will have fixed salaries, but will be required to collect the usual commissions for selling produce. The commissions paid for marketing cattle, swine and sheep at Kansas City, Chicago and St. Louis, in 1887, were \$2,883,816; add to this sum half as much more for Cincinnati, Omaha, Indianapolis, Cedar Rapids, Louisville and St. Joseph, and we have the total commission for selling cattle, swine and sheep of the Mississippi valley, \$4,325,725. The annual production of wheat, corn, oats, rye, flax and barley in the Mississippi valley is estimated at 3,000,000,000 bushels. It is safe to say that three-fifths of this amount is sold in the public markets, on which the commissions are paid by the producer, amounting to about \$6,000,000, making a grand total of commissions paid on livestock and cereals, \$10,000,000 annually.

This entire business of selling could be done under our proposed trust system at a cost not to exceed \$1,000,000 annually. The sum collected by our agents as commissions, after deducting the amount necessary for the payment of salaries and running expenses of the trust, would be paid into the treasury for the benefit of the stockholders, and should this plan be generally accepted and the farmers and stock-raisers market all their produce through our agencies, it would effect a saving in commissions of \$9,000,000 annually, and in two years, at this rate, we would have in the treasury \$18,000,000 placed to the credit of the stockholders, which could be paid out in dividends or appropriated in the purchase of stockyards and grain-elevators, and thus another great saving would be accomplished by reducing stockyards and elevator charges. * * *

The keystone to the arch of this combination is the local shipping agent, who can always be reached by telegraphic communication, and through whom all shipments of farm products will be directed by the Executive Board. At the present time there are less than one per cent of the farmers and stock-raisers who do their own shipping. They are obliged to depend on local buyers to gather up their produce and ship upon the market. Under this system, no outside local buyer could compete with our shipping agents. If 80 per cent of the farmers should refuse to subscribe stock, and remain outside of the association, they would only deprive themselves of being equal beneficiaries of the trust, but could not defeat the object for which the trust was inaugurated; for this 80 per cent would be compelled, through interest and necessity, to market their produce through the trust agencies, thus giving the trust control over shipments, and power to regulate the supply and govern the market, while the entire agricultural class would be benefited by receiving a more uniform and reasonable price for their products; but special pecuniary advantages would accrue to the stockholders of the organization.

The closing hours of the Topeka meeting were spent in considering the report of the Committee on Resolutions. After a long discussion, the following was adopted:

In view of the great importance of the matters which this convention was called to consider, it is wise to give them careful consideration and take time enough to do it, therefore.

Resolved, That the further consideration of the pending resolutions be postponed to an adjourned meeting of this convention, to be held in Topeka, Kan., Wednesday of the third

week in November, 1888, at which time and place the National Farmers' Convention will be in session.

Resolved, further, that only farmers and those persons who are working with them and for them be admitted members of the adjourned meeting.

Resolved, further, that a committee be appointed by the president of this meeting, to consist of one member from each of the States now here represented, except Kansas; that two committeemen be appointed from this State, and that one of them shall be the Hon. Walter N. Allen, the originator of this movement; that the committee be instructed to investigate the subject matter before this body, and report to the adjourned meeting.

The chairman accordingly appointed the committee, as follows: Kansas, W. N. Allen and W. A. Pfeiffer; Indiana, Col. William Crimm; Nebraska, Gov. Butler; Iowa, Henry Wallace, of Des Moines; Missouri, Judge C. F. Moulton; Illinois, S. T. K. Prime, of Dwight; Minnesota, Gen. James H. Baker, of Mankato.

A Trip to Oregon.

Leaving on the 6:30 P. M. express from San Francisco, we arrived at Sacramento about 9, and proceeded by way of Marysville after the usual half hour's customary delay. Just why an express train should take this roundabout way for Oregon, whereby two or three hours at least are lost at the commencement of the trip, we are not advised. About daylight we passed Redding, now the county seat and a place of growing importance at the extreme northern limit of the Sacramento valley, 234 miles from San Francisco. For a period of five or six hours the route close along the Sacramento river is one of the most beautiful and delightful that it has ever been our pleasure to travel through. We doubt if any other railroad in the world affords such rare, entertaining and beautiful scenery incessantly for the same period of time in passing. The water in the upper Sacramento is as pure and pearly as that of the Merced in Yosemite valley, and seems as tempting to the taste.

The lands near Mount Shasta are suggestive of the title "sweet, juicy mountains." Sissons looks like a mining town of the largest type of early days, situated on wooded and cleared flats. It is being built up in view of the fine lumber district by which it is surrounded. The mountains here seem flattened out, affording long and often quite broad valleys, covered with meadows which are clothed in bright green grasses, and bright with beautiful wild flowers, lending a similar charm to the meadows of New England in early June, over which Mr. and Mrs. Bobolink delight to hold sway, and charming all listeners to their sprightly songs as well as themselves, no doubt.

Mr. Shasta and the higher peaks were shut off from our view by clouds and swift-moving mists both on the occasion of our going and coming.

Leaving Sissons some four hours are occupied in passing between beautiful hills and ridges and some quite large valleys, some portions of which showed evidence of alkaline soil and a growth of sagebrush, but the greater portion was covered with prolific-growing alfalfa and beautiful meadows similar to those mentioned. Cole Station was reached about 1 o'clock. It is located in California, 6½ miles or so from the Oregon line.

Although cloudy and threatening weather had been experienced from Sissons, the first rain caught us about three minutes after we passed the Oregon line, and the landscape from that time on was refreshed with occasional showers.

Climbing over the Siskiyou range, its grand views of hills, woods, tunnels, fills, and trestle-work, sharp curves, precipices, forests, trestles, deep ravines, and even mountains below us, we still observe denser forests and higher and more precipitous mountains above us, through which our heavy, panting engines took us gracefully, proved to us the most interesting portion of our trip from the valleys of California to those of Oregon.

Ashland, one of the southernmost cities in Oregon, rests like a queen on the hillside, overlooking one of the greenest, richest, most beautiful and fertile landscapes it has ever been our privilege to behold. It seems fairly surrounded with beautifully clustered and picturesque gems of scenery.

For 300 miles northward along the railroad is strung a succession of similarly situated towns, all of which look new, prosperous and promising of future growth and advancement.

The ride all through the valleys and over the ridges in Oregon, owing to the nearness and novelty of the low hills and forests, the exceedingly fresh and verdant growth of grasses and other agricultural products was never tiring. It seemed to reveal to us in our ride, of some 300 miles from Ashland to Salem, observing the diversified growths of the rich lands supplied by natural irrigation with the present sparsity of population, that the half cannot yet be told of the future outcome of such a climate and such rich agricultural lands as are possessed by Oregon. In the language of Hendrik Hudson, the discoverer of Hudson's river, expressed to his companions: "It is a good land to fall in with boys, and a pleasant land to see."

At Turner we were approached by an intelligent, pleasant-looking farmer, and asked if our name was "D." He proved to be Brother

Hilleary, who was on the lookout for a pilgrim from California of our dimensions, and we had pleasant company for the next six miles to Salem, where Brother Hayer, Worthy Lecturer, introduced us to Brother Boise, Master of the State Grange, and we were wheeled away to the Master's delightful home in the suburbs of Salem, and a few minutes later found ourselves in the State Grange, receiving the warm, hearty greetings of the noble, stalwart Patrons of Oregon.

Arriving Wednesday morning, we were privileged to enjoy two days only of the three days' session. We wish that every Patron of California could have been present, for in no other way could they realize the faith, hope and charity with fidelity evidenced by our brothers and sisters of Oregon throughout their entire harmonious session; nor the kind manner in which Californians who give the true password and signal in their camp are received; nor the generous, prompt and unprejudiced manner in which they expressed their cordial disposition to work and co-operate with their Californian brethren.

We owe many thanks to Bro. Boise and members of his family for entertainment in their cultured and happy home, as well as to Brother and Sister Stamp, Brother and Sister Hayes, Brother and Sister Hilleary, and we feel like expressing personal thanks to the assemblage of brothers and sisters, without exception, whose hearts were so full of kindness and generosity to the California representative during our short visit.

We passed just five days and six nights on the journey, four nights being spent on the sleeping car, two nights on the rail and three days in Salem, but it seems as if we got a month's enjoyment out of it though.

Leaving Salem at 6:30 P. M. on Friday, we arrived in Oakland at 7 A. M. on Sunday.

We were personally at a disadvantage during our visit to Salem from the effects of a severe cold, which went with us and returned with us to California. Hereafter we shall endeavor to make further mention of our experiences and observations while in the land of our good Northern friends.

Sutter County Farmers' Union.

The annual meeting of the Farmers' Co-operative Union, of Sutter county, was held at Yuba City on the 19th ult. The *Farmer* reports the meeting as follows: There was a good attendance, 371 shares being represented out of 491 subscribed. The business of the last year was shown to be satisfactory. The capital stock of the union was originally placed at 1000 shares, with a par value of \$50 per share. Of this but 491 had previously been subscribed, when no further attempts were made to dispose of the balance. It having become desirable that the remainder of the stock should be taken, and the reasons therefore stated by President Carpenter, Chandler, Ohleyer and others, when the stockholders at once came forward and subscribed for the 509 shares as fast as their names could be taken down. After this, a proposition was submitted to amend the Articles of Incorporation, which was unanimously approved. The election of directors resulted in the choice of the old board, viz.: George W. Carpenter, B. F. Walton, John H. Kimball, James Littlejohn, A. H. Wilbur, A. L. Chandler and Geo. Ohleyer, by a unanimous vote of the stockholders, no others having been placed in nomination.

SISTER E. Z. ROACHE has been appointed District Lecturer for Santa Cruz county. The full import of this information will be realized by those who have attended the State Grange and heard Sister Roache declaim. Bro. Steele informs us that the sister read the Declaration of Purposes at Watsonville Grange picnic with such life and vim that even those slow to comprehend could readily grasp the wisdom of this wonderful document, and Patrons of long standing appreciated the truths therein set forth more than ever before.

FOR ASSEMBLYMAN.—We are pleased to see the nomination of Vital E. Bangs of Stanislaus county for the assembly by the Democrats. Mr. Bangs is one of our best informed and progressive farmers and a prominent member of the Grange. If both parties would nominate such men we would surely be well represented in the Legislature.

GOOD TIMES IN VARIOUS GRANGES.—The Patron this week gives pleasing accounts of the Temescal Harvest Feast, the Merced reunion, and of sundry picnics—Watsonville; Sacramento county, Magnolia and Grass Valley—beside an extended report of Grange doings in Oregon, which, for lack of space, we can barely thus allude to.

THE "RURAL" AS A LIVE-STOCK JOURNAL.—One of the leading cattle-breeders of the great West writes: "I am much pleased with your paper and to know that the stockmen of your coast can avail themselves of a home paper of such great merit."

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

CHERRIES FOR CHICAGO.—*Haywards Journal*, May 26: Last Thursday at noon a carload of cherries was started from San Leandro for Chicago by the Gregory Bros. Co. of Sacramento. This is the earliest shipment of a carload of fruit ever made from California to the East. The cherries were of the finest quality, of the best varieties, and came from the orchards of Messrs. Huff, Faerrily, A. Rogers, W. Hulbert, H. W. Meek, Henry Marlin, E. T. Crane, F. Bryant, M. Wicks, H. F. Crane, W. F. Saunders and Joe Garcia.

PRESENT FRUIT PRICES.—The way the fruit-buyers are gathering up all our fruit is an indication that they cannot get enough. The rivalry between the cannery agents and the fruit-buyers is very keen. The ruling price for Black Tartarian cherries is four and five cents, and for Royal Anns six cents, while even as high as seven cents has been paid. The failure of the Luak cannery dropped the price of apricots half a cent. But the price is firm at 2½ cents, San Jose buyers bidding freely at this figure. . . . The demand for cherries is greater than previous years, and as for apricots, they are more than holding their own; in fact, the price is much better than last year. We are aware that there is a shortage in the crop in most places, but the increasing demand for cots by the canners will always make this fruit exceedingly popular. It is no uncommon thing to clear \$100 an acre on cherries, and we know of several instances where the fruit sold realized \$500 an acre. This is particularly the case with Royal Anns.

Calaveras.

THE CROPS.—*Murphys Cor. Angels Record*, May 20: The season in the mountains will be marked by increased production and more remunerative returns than for years past. It has, so far, been favorable for the hay and potato crops. This is acceptable, as last year the crop was almost an entire failure. In the vicinity of Murphys I am sorry to record a partial failure of the hay and grain crop, the last rain coming too late to be of much benefit.

Contra Costa.

DANVILLE ITEMS.—*Cor. Martinez Gazette*, May 20: Hay is going on. A larger acreage than usual will be cut this year, but the amount of hay will not be so great. The wheat surplus also will be light, but fruit and fruit trees do not suffer perceptibly. Thorough cultivation holds the moisture near the surface, and many almond and apricot trees have young shoots of this year's growth two feet long already. We have just returned from a careful examination of the young orchards of this vicinity, and find every one with a clean glossy bark and bright leaves, indicating a vigorous growth. . . . A. T. Hatch's young orchard near Alamo is an ornament to the valley. The trees being well selected, set out and now thoroughly cultivated, look as thrifty as any one could desire, and almost every tree is living, notwithstanding we have not had a drop of rain since the trees were put in their places. . . . Stock is looking finely, and this cool weather is making pasture last well. The outlook now is for plenty of fall feed. . . . Several almond crops have already been contracted for at 12½ cents per pound, and the trees are fairly well loaded.

LIVE STOCK FOR JAPAN.—*Martinez Item*, May 22: Mr. Ridgway of the Cook Stock Farm was down yesterday looking after the shipment of some fine stock to Japan. The herd consists of two Shorthorn cows that will weigh about 1600 pounds, four Devon heifers, beauties, one Shorthorn bull weighing over 1800, and two Devon bull calves, nearly a year old, perfect in form and color. This stock is all thoroughbred and registered in the herd-book, and brought top prices. B. Hirosewa of Yachigashira, Awamori Ken, Japan, made the purchase, to whom all will be shipped in a few days by steamer to Tokio, Japan. . . . In addition to the cattle a horse bought from Mr. Conway of Danville will be shipped. He is a two-year-old by Electioneer and he by Electioneer, for which Mr. Conway received \$475.

Fresno.

CHIMNEYS FULL OF HONEY.—*Selma Irrigator*: Our friend E. F. Hammers is in a bad fix. A few weeks ago he ceased to use the fireplace at his residence. During the late cold snap he undertook to build up a fire in the grate, but the chimneys refused to do their work and the fire smoked him out. On investigation he found that a swarm of bees had taken charge of the two chimneys in his house and that they were both full of honey. So tightly are the chimneys filled up that he is unable to smoke them out and they are too lively bees to be run out.

Humboldt.

OATS AND FEED.—*Eureka Standard*: J. O. Dinmore, who owns a splendid farm on Hol river near Junction station, says he has never seen oats looking better than they do this year. Oats is the principal grain grown in this neighborhood and he thinks the yield will be unusually large. He says from what information he can get he believes grass on the ranges will be much shorter than usual. Mr. Dinmore is a thoroughly practical man and believes stockmen would do better to have fewer stock and take better care of them. There is no money in having more live-stock than you can feed well.

Lake.

CROP NOTES.—Lakeport *Avalanche*, May 24: Trees of all kinds are loaded with fruit, much of it not yet half grown. There should be a portion picked off as the trees will not be able to develop so large a crop, and by thinning it out the fruit will be much better. Peaches, apricots, almonds, and indeed all kinds of trees are looking fine and full, and Lake county will badly need some proper means to care for the products of the present year. . . . In Scott's valley the hay is turning out from 1½ to 2 tons to the acre. All other crops look well and promise nearly a full yield.

Lassen.

DISTRICT FAIR ASSOCIATION.—*Alturas New Era*: The Board of Directors of the 11th District Fair Association held their annual meeting at the office of the secretary in Susanville, May 5th, all the members being present. The bid of Susanville being the largest one presented, the fair for this year, commencing September 24th, was located at that town. All of the former officers were re-elected as follows: J. W. Thompson, President; J. D. Byers, V. P.; D. C. Hyer, Treas.; R. L. Davis, Sec.; J. R. Murray, Ass't Sec. The speed program was arranged and \$10,000 in purses provided for. The premium lists amount to \$5000; total, \$15,000. The board adjourned until August, 1888.

Los Angeles.

THE POMONA CANNERY.—*Progress*, May 24: The work of building the Pomona cannery is progressing rapidly. The brick walls will probably be finished this week, and work upon the roof and floors will be immediately begun. Mr. Sanborn, who is to have supervision of the cannery, has been here three weeks, and is looking after the building. A large fruit evaporator arrived last week, and more apparatus is expected next week. A large quantity of jars for canned fruits are already here. Mr. Sanborn assures us that the cannery will be in readiness for all the fruit this season.

Mendocino.

FROM HOPS TO ALFALFA.—*Mendocino Republican*: On the land that has been planted to hops in this county may be raised the finest alfalfa. This our farmers are taking cognizance of and have this season put in considerable of that seed. They recognize the fact that instead of being an unsalable article, as is too frequently the case with hops, the hay can always be sold at a profit. Then, also, there is good pasturage in the alfalfa fields after three cuttings of hay have been hauled therefrom. With the growing of this crop we will have a different industry opened up in this country. Just now, and for the last three months, Ukiah folks have eaten butter made at or near Petaluma, in Sonoma county, and at Point Arena, in this county. Time and again have our merchants had to reply: "No butter; can't get any." Now this is all wrong. With valley land that is second to none on the continent, watered as it is every winter by never-failing rains, the idea of buying this necessity outside of Mendocino county is most absurd. Around Point Arena the capitalists are those who have paid close attention to the dairy business. In the eastern part of the county hops have financially ruined some of our most estimable citizens.

Monterey.

CROP OUTLOOK.—*Salinas Index*, May 24: A gentleman who took a trip through the southern portion of Monterey county last week reports his observations as follows: The early-sown crops in Long valley and peach trees look well. There will be plenty of hay and considerable grain, if the present cool weather continues. In Priest valley the crops look better than at a corresponding date last year. The prettiest fields of grain I have seen are in Indian valley. Vineyard, Ranchita and Hog canyons have very good prospects. In Cholame the early-sown grain looks well, and with favorable weather will produce a good crop. The general outlook in this portion of the county is favorable. Many fruit trees have been set out and the country is otherwise improving.

Napa.

FAIR ASSOCIATION.—*Napa Register*, May 18: An adjourned meeting of subscribers to county fair stock was held in the Court-house last Saturday afternoon. D. L. Hackett presided, and A. H. Conkling acted as Secretary. F. L. Coombs, chairman of Committee on Grounds, reported several offers from land owners. The report was received and referred to the nine directors chosen the week before, who will visit the various sites proposed, and decide which is most suitable. . . . Immediately following the adjournment of the stockholders meeting, the directors met and elected officers as follows: President, L. L. James; Vice-president, F. W. Loeber; Secretary, A. H. Conkling; Treasurer, W. J. McCollum. A certificate of incorporation has been received from the Secretary of State and By-Laws for the association are in the hands of the directors. After they have been perfected and approved they will be submitted to each stockholder for his signature.

THE GROUNDS SELECTED.—*Register*, May 25: A committee of the directors of the Agricultural, Horticultural and Vinicultural Association Friday concluded negotiations with Isaac McCoombs whereby 65 acres of land taken from the northerly half of the McCoombs farm, one mile northwest of Napa, have been leased for a term of five years at an annual rental of \$10 per acre, with the privilege of buying at any time during the term of said lease for \$400 per acre. This gives the Association abundant

room for a one-mile track and the necessary stands, buildings and other conveniences. The site is high, central, and is not only located on the main traveled dirt roads of the valley, but takes in as well enough of the railroad to command direct shipment to and from the grounds. . . . The work of surveying and building track will without doubt be entered upon at once.

Nevada.

EXTRA BARLEY.—*Grass Valley Tidings*, May 26: A sample of barley from the farm of Hon. Wm. George, at Indian springs, was brought to town to day by B. A. Van Slyke, lessee of the place. It was plucked at random from a ten-acre field and shows as high as 17 stalks to the root (or seed) and the heads are large and filled out plumply. Mr. Van Slyke tells us that it will thrash 40 bushels to the acre. This was planted early in season and went through the cold snap; but the damage resulting from the frigid temperature has been more than made up by the manner in which it has "stooled out"—for in many cases the stalks run as high as 25 to the seed, and will average ten stalks. Barley is always a good crop in the foothills.

Placer.

BARLEY.—*Auburn Republican*, May 23: This office is in receipt of specimens of barley grown by W. M. Holmes at the Grizzly Bear ranch, on the road to Forest Hill, which ought to be sent to the eastern fairs. The heads are four inches long, well filled and plump, and the beards measure nine inches in length, which gives a small bunch the appearance of a whisk-broom. It is growing on new land, and John McAninch says it is one of the finest fields of barley he ever saw.

CHERRIES.—A magnificent box of Black Tartarian cherries, received by express from Ira Avery, are the most luscious ever tasted. Mr. Avery's cherry orchard stands with Robert Hector's, the two largest and finest in California to-day. . . . Some specimens of Black Tartarian cherries from Dr. H. H. Clark's ranch, near Auburn, are equal to Avery's or Hector's, and prove that the river bottoms are not alone adapted to possibly the most profitable of our foothill fruits, the cherry.

WHEAT IN WESTERN PLACER.—*Auburn Herald*, May 26: Owing to the cool breezes that have prevailed for the last three months, the outlook for a good harvest is much better than it was in April. The moist southern wind has brought forward the grain wonderfully. The heads of wheat have filled out and the kernels are plump and heavy. Had the hot, dry weather of April continued, the crop of many farmers, especially those on the red lands, would have been a complete failure; but now all except those whose grain was winter sown, are satisfied that the crop of 1888 will be better than it has been for the last three years.

Sacramento.

THE NEW CANNERY.—*Record-Union*, May 26: Articles of incorporation gave been filed in the office of Secretary of State of the Sacramento Packing and Drying Co. The purposes for which the corporation is formed are to pack and dry fruits, vegetables, fish, meat and game, and buy, sell, and handle fruit, fish, meat and all kinds of produce. Principal place of business, Sacramento. Directors—John M. Avery, Wm. Schaw, C. H. Cummings, Jos. F. Hill, A. S. Hopkins, Edward Dieterle, Sacramento; Jos. Routier, M. C. Pike, John Studarus, Rountier's; Wm. Johnstone, Geo. A. Smith, Courtland. Capital stock, \$50,000, divided into 5000 shares of the par value of \$10 each. The capital stock actually subscribed is \$30,100.

Santa Cruz.

PAJARO STRAWBERRIES.—*Courier-Item*: The strawberry fields of the Pajaro valley are a wonderful sight. One farm has 110 acres of solid berries; another has 60 acres, and so on down. No finer drive could be desired than that out on the pretty tree-lined Lake avenue, with comfortable homes, flower gardens and orchards on each side, to where Laguna Grande lies, blue and beautiful. From Laguna Grande the water is raised by steam pumping works for the irrigation of the strawberry farms of Ira Thurber, R. W. Eaton and others; it is carried by an elevated sluice and distributed as wanted, with frequent facilities for shutting off. To accommodate this system of irrigation the land is carefully graded, so as to have the proper inclination, and the rows of plants, with trenches between, are laid out so perfectly in accord with this system that a bird's-eye view of them looks like an immense page of problems from Euclid. The cultivation is absolutely perfect, and is done by Chinamen, for whom, on the two farms of Thurber and Eaton, hastily visited on a recent trip, we found neat and comfortable quarters provided. The great red globes of the ripened berries gleam out from every little cluster of leaves, and the whole is a tempting and beautiful sight. Watsonville shippers of the fragrant and appetizing berry are rejoicing over the fact that facilities for getting the crop to market in good shape and at propitious hours are, this year, much improved.

Sonoma.

ARMY WORM.—*Santa Rosa Democrat*, May 26: From O. H. Hoag, who returned from Sonoma Saturday, it is learned that the army worm has appeared in the Drummond and Shaw vineyards, coming from Napa valley. In some spots the devastating insect is accompanied by a small black bug.

HANDSOME EXOTICS.—Mr. Dunn, the county gardener, has just received several varieties of handsome shrubs for propagation on the Court-

house grounds, the most curious of which are two varieties of the African variegated holly, from the banks of the Ganges river. They are said to be of the first importation ever received in this country. The leaves are beautifully traced with white and yellow, and their points are tipped with thorns. During the winter months they blossom and bear a small red berry.

THE VAN ALLEN CANNERY.—*Healdsburg Enterprise*, May 23: This cannery began operations on Thursday morning with about 40 hands, mostly women and girls, and although it was but a trial, everything worked to entire satisfaction. But a small supply of cherries being on hand, operations were discontinued early in the forenoon. So completely had everything worked that in this short time 144 crates of 12 cans to the crate had been put up and were ready for shipment. . . . When this cannery is working to its full capacity it will employ from 225 to 275 hands, to whom the price paid ranges from \$1 to \$2.50 per day, according to the work. The capacity will be from 10,000 to 14,000 cans daily.

Tulare.

"SPLENDID WHEAT."—*Visalia Delta*, May 24: Three bundles of splendid wheat fully five feet in height, may be seen at the real estate office of G. A. Botsford. It was grown on the farm of T. W. Standart, two miles north of Huron, and we have seen none grown elsewhere this season that equals it. The heads are large and the grain well filled, although not yet quite ripe. When matured, there will probably be no grain in the county better than in the field from which was taken the sample sent us.

A GENUINE THERMAL BELT.—As proof that the thermal belt of this valley is such, may be mentioned the fact that tomato vines two and three years old are still living after last winter, which was an extremely cold one. A number of these vines were killed but there is a large area in which an ordinary frost will not injure the most sensitive plants.

BALD BARLEY.—*Visalia Times*, May 24: Wm. Taylor on Tuesday last brought to this office a sample of bald barley, now growing on the ranch of Joel Smith, one mile from Huron. The stalks are fresh and green, all of three feet in length, and contain heads that are well filled with grain. The sample is a fair average from a 70-acre field that promises to yield not less than 60 bushels per acre. Mr. Taylor is of the opinion that 1200 tons of wheat and barley will be harvested this season in the vicinity of Huron.

COYOTES SMOTHERED.—Jasper Harrell was quite successful in exterminating coyotes this week. They have been making sad inroads among his chickens and goats, and he concluded that the only way to get rid of them was to make a search for their hiding-places and destroy them by the wholesale. A few days ago he discovered one of their dens in the ground, gave it a thorough smoking, and on digging into it the following morning, was delighted to discover that he had put a quietus on nine of the thieving curs.

Yolo.

THE MEXICAN BEARDESS BARLEY.—In regard to the quarter-section of this variety of barley mentioned in our "Agricultural Notes," May 12th, the *Woodland Mail* further says: "The magnificent crop is remarkably clean, no oats or other species of grain appearing. The uniformity of growth, the apparent vigor and strength of the stock, the fullness and evenness of the heads are features which an old farmer would remark as something unusual in such a season as this. The head of this barley has very much the appearance of 'Bald barley,' but differs from Bald barley in that the kernel when threshed is like the ordinary bearded barley, while the other threshes out more like wheat or rye. It is claimed that this variety is superior to the bearded for several reasons. It is known to stand the north winds and not thresh out. The stock is strong and when well ripened the heads will not droop down below the reaper blade and be lost, as is often the case with the bearded varieties. It grows a strong stalk and cattle readily feed upon the stubble. Being free of beards, it makes the best hay in the market."

THE BANEFUL BARBS.—*Mail*, May 26: A few nights since a mule belonging to J. W. Norton, who lives this side of Winters, got its head fastened in a barbed wire fence in such a manner as to cut its throat and neck so that it was found dead next morning. The animal was valued at \$250.

Yuba.

MARYSVILLE AHEAD ON CHERRY PLUMS.—*Appeal*, May 25: A correspondent of the *Record Union* says: "The first plums of the season were picked on the ranch of G. D. Kellogg, at Newcastle, on May 18th. They were of the cherry plum variety and very highly colored." J. W. Hicks of the Briggs orchard beat that record by five days. He picked on the 13th inst. over 30 pounds of cherry plums, which were shipped by express to A. Lusk & Co. They were well ripened and very palatable.

NEVADA.

AGRICULTURAL SOCIETY FORMED.—*Silver State*, May 24: An Agricultural Society has been organized at Elko, and Gov. Stevenson has appointed J. R. Bradley, W. T. Smith, T. T. Harris, T. E. Clagnon, Ed. Odell, F. Honeyman, A. B. Miller and Isaac Griswold as trustees of the association.

News in Brief.

FRESNO is to have a new postoffice building that will cost \$20,000.

THE day's wages of a skilled mechanic in Astoria will buy a barrel of flour.

THE Orphans' Home of Los Angeles realized \$4500 from the late flower festival.

WORK has been begun on a coal-bunker at San Diego that will hold 1000 tons.

THE entire business portion of Tipton, Tulare county, was destroyed by fire last Sunday.

THE Central Pacific Railroad Co. is having an artesian well bored at Battle Mountain, Nev.

PASADENA is to have iron works, the machinery and tools to be brought from Pennsylvania.

THE towns of Wellville and Allentown, N. Y., were severely damaged by a cyclone on Monday.

A BILL has been favorably reported in the Senate to reduce the limits of the Round Valley Reservation.

FOREST FIRES are destroying much good timber on the Northern Pacific in Western Washington Territory.

A PITTSBURGH steel-casting company has an order from the Australian gold mines for a carload of patent corrugated rolls.

THE first case of drowning at Santa Cruz beach was that of John Murphy, who tried to swim out to one of the rafts while intoxicated.

EVERYTHING at Mt. Hamilton is in readiness and the Lick Observatory will be turned over to the Regents of the University in a few days.

W. G. CURTIS, superintendent of track of the Southern Pacific Company, has been appointed assistant to general manager Towne.

THERE is no doubt, says the *Yuma Sentinel*, but that work will be commenced on the railroad between San Diego and Yuma early in September.

THE Glucose Trust recently formed, with headquarters at Chicago, has been dissolved. Each factory will hereafter transact its business independently.

A BILL has been favorably reported by the House Committee on Military Affairs to place Major-General John C. Fremont on the retired list of the army.

A SECTION of giant fossil fish jaw-bone was dug up at Santa Cruz last Saturday. It was found in a well 57 feet from the surface imbedded in limestone.

TRAVEL to and from Los Angeles is increasing daily. The trains are so long that they have to be run in two sections for a great portion of the distance.

THE Watsonville schools are having a vacation to give the boys a chance to hoe and weed sugar-beets, it being impossible for the beet-raisers to obtain sufficient help.

THE present season of rain is the first thorough soaking that Nebraska has had in two years, and with a moderate rainfall during the season, big crops will be inured.

By a railroad collision at Walnut Station, Arizona, brakeman Howell was killed and the engineer, fireman and two brakemen injured. Twelve cars were ditched and broken.

ACCORDING to the records, there has been a rainy season in the latter part of May and early part of June in Nevada every year since the signal office was established at Winnemucca.

IT is reported at the headquarters of the National Educational Convention that about 10,000 or 15,000 people will be present at the National Teachers' Convention in July in this city.

EXCELSIOR GEYSER, in the National Park, M. T., is discharging a column of water 16 feet in diameter and 300 feet high. The eruptions occur every 45 minutes and last from three to five minutes.

SENATOR STANFORD states that in the Leland Stanford Jr. university girls are to have equal advantages with the boys, and all facilities will be provided for them for fitting themselves for every employment suitable to their sex.

ST. VINCENT'S ORPHAN ASYLUM at San Rafael is being investigated by Governor Waterman's orders. Charges of cruelty and neglect have been made, and judging from the newspaper reports, are not without foundation.

THE *Portland Oregonian* says: The pamphlet of the State Board of Agriculture will be issued in a few days. It will be the most comprehensive descriptive work on Oregon yet published, giving full information and slighting no portion of the State.

THE new Union depot of the narrow gauge and broad gauge railroads at Santa Cruz will be located considerably farther south of the present broad gauge depot, in the region so long occupied by large lumber-yards, entrance being had from Pacific avenue.

At a meeting of the Executive Committee of the California Commissioners to the Australian Exhibition it was announced that everything possible had been done by the Commissioners to excite interest in the exposition, but so far they had only succeeded in enlisting about 20 exhibitors comprising machinery, flour, mining, leather, wine and canned goods interests. The Chairman spoke in strong terms of the apathy in regard to the matter which he and his associates had encountered. This might possibly be due to the late hour at which the matter was brought prominently forward, and, also, perhaps, to the fact that Eastern shippers had forwarded some large exhibits which prohibited their friends on this side from sending. Still it was not yet too late for business-men to seize what was practically a big, unique, free advertisement of their specialists and California's resources.

Overworked.

Up with the birds in the early morning—
The dewdrop glows like a precious gem;
Beautiful tints in the skies are dawning,
But she's never a moment to look at them.
The men are wanting their breakfast early,
She must not linger, she must not wait;
For words that are sharp and looks that are sur'y
Are what the men give when the meals are late.

Oh, glorious colors the clouds are turning,
If she would but look over hills and trees;
But here are the dishes, and here is the churning—
Those things always must yield to these.
The world is filled with the wine of beauty,
If she could but pause and drink it in;
But pleasure, she says, must wait for duty—
Neglected work is committed sin.

The day grows hot, and her hands grow weary,
Oh, for an hour to cool her head
Out with the birds and winds so cheery!
But she must get dinner and make her bread.
The busy men in the hay-field working,
If they saw her sitting with idle hand,
Would think her lazy, and call it shirking,
And she never could make them understand.

They do not know that her heart within her
Hungers for beauty and things sublime;
They only know that they want their dinner,
Plenty of it, and just "on time."
And after the sweeping and churning and baking,
And dinner dishes are all put by,
She sits and sews, though her head is aching,
Till time for supper and "chores" draw nigh.

Her boys at school must look like others
She says, as she patches their frocks and hose,
For the world is quick to censure mothers
For the least neglect of their children's clothes.
Her husband comes from the field of labor,
He gives no praise to his weary wife;
She's done no more than has her neighbor,
'Tis the lot of all in country life.

But after the strife and weary tussle
With life is done, and she lies at rest;
The nation's brain and heart and muscle—
Her sons and daughters—shall call her blessed.
And I think the sweetest joy of heaven,
The rarest bliss of eternal life,
And the fairest crown of all, will be given
Unto the wayworn farmer's wife.

—E. H. Wheeler.

Melissa.

The young stranger reined in his horse at the top of a little hill, and gazed with pleasure upon the sylvan scene. Just before him two mountain creeks formed a junction. The larger one he had been following for some hours, and now, from his left, a noisy tributary came rushing down from its rugged ravine, roaring with impatience at the huge boulders of granite which obstructed its way. To the right, on the opposite side of the main stream, a yellow bluff rose abruptly to a great height, crowned with a stately fringe of redwood trees. On the very edge of the precipice, a great madrone tree thrust its fantastic bulk out over the creek flowing more than a hundred feet below. The rain had washed the earth from its contorted roots, and it seemed in imminent peril of plunging into the abyss. On every other side, the forest hedged in a little clearing at the junction of the creeks. In the clearing there stood a large cabin, built of split boards and shakes. Its only color was the dark hue given by the weather. A rude fireplace of bowlders and clay rose at one end of the building, terminating in a chimney of sticks and mud.

Night was fast closing in. The yellow rays of the declining sun touched the tops of the trees on the bluff. The traveler thought it time to apply for shelter, as he was in a strange and wild country. He rode gently down the slope, and drew up at the cabin door.

"Hallo."

The door opened, and a tall, sallow woodman appeared. His long, untrimmed beard gave him a haggard look. The stranger told his needs, and indicated his willingness to pay for such accommodations as could be afforded him.

"Stranger," said the woodman, "if you're willin' ter put up with mount'n fare, an' say nothin' about pay, we'd be right glad ter hev yer stop. 'Light, an' make yerself ter home. I hain't got no hay for th' critter, but you kin stake him out in the feed yander. I see you got some grain tied ter yer saddle."

Still further pressed by the hospitable mountaineer, the stranger dismounted, and, uncoiling a picket rope from the pommel, led his horse to a level patch of grass near the creek, where he fastened him, after relieving him of the saddle.

As he followed his host into the cabin, he saw in the room, and peeping at him from various doors, a boy and four girls, the eldest about 12 years of age. Their yellow hair hung about their faces, thick and straight; their clothing was simple, and of neutral tint; and their bare

feet showed an intimate acquaintance with the rude country about their home. They gazed bashfully at the stranger, and were admonished in low tones by their pale and careworn mother.

Then there was an unusual stir in the little household. The good woman drew out the table, and spread upon it a tablecloth of snowy whiteness—the best of her little store of linen. The few cherished bits of tableware were carefully brought forth; the reserved stores of the slender larder were drawn upon; all in honor of the stranger, who looked with thoughtful admiration upon their gentle and generous hospitality.

When supper smoked on the board, the stranger was given the honored place. The host looked over the table with satisfaction.

"You done well, Charity," he said.

The stranger praised his entertainment, and amused his kind entertainers with cheerful accounts of the world beyond the mountains.

At intervals, indistinct sounds came to his ears from another room, and he perceived that all the children were not at the table. Occasionally the father and mother would glance at each other uneasily, and the latter would silently go to the room whence the sounds proceeded.

Supper over, the mountaineer and his guest sat before the fireplace, where sticks of pitchy fir were burning with intense glow and heat. The host filled his pipe thoughtfully. There was a pathetic look on his face. He placed a glowing coal in the bowl and drew deep puffs.

"It's Melissa," he said at last, turning to the stranger with a sigh. "My oldest gal, Melissa. She's bad." The stranger perceived at once that he meant that she was very ill. "She's mighty bad," he continued, in a low tone. "I'm dreadful afraid she's a-goin' to peter out. Char'y don't give up hope, though. Melissa's only fourteen year old. Stranger, I wish you could 'a' seen that gal four year ago. The peartest little thing you ever see—beat the rest all holler. She'd run an' climb, an' sing, an' allers ready ter help her mother. It come to an end mighty sudden, pore little gal." The mountaineer paused, and brushed his sallow cheek.

"Mebbe you noticed that big old madrone a-growin' out over the edge or the bluff across th' crick. Well, jess take another look at it to-morrow mawnin'. Four years ago las' spring there was a ter'ble savage old Californy lion round yere. He 'bout cleaned out the young colts, I reckon. Them critters is awful fond o' cold-meat. There was old man Pardee, an' Jack Briggs, an' Tom Baily, an' some others, all lost colts; an' the mares ud be found all scratched up in the mawnin'.

"Well, one day Char'y an' me went up to old man Pardee's, an' lef' the child'en to home. We never 'spected no danger. There was five of 'em. Melissa was ten, an' Toby, my boy, he was 'bout six. Barby wa'n't born then. Well, about the middle or the afternoon, the little gale was a-playin' outside, an' Melissa was sorter fixin' up things 'bout the house so's ter surprise her mother like when she got home. Pretty soon she tuk an' idee to go up around the bluff ter the open land up above an' get some wildflowers fur a bokay, 'cause she knowed th' ud please her mother. Well, she went up to the trail above yere, an' picked quite a bunch o' posies; an' by the time she was close on to the big madrone at the top or th' bluff. So she set down on it, fur the butt run out mighty nigh right straight, an' began ter fix up her bokay.

"While she was a-settin' there, with her feet over the edge—fur Melissa wa'n't afraid o' nothin'—and kinder singing to herself as she fixed the posies, she chanced ter look down, an' what d'you s'pose she seen? Stranger, she see little Toby down ter the crick with a fishin' pole a-tryin' to fish as he'd seen me do, an' 'bout a rod behind him she see a long yellor critter, with a long tail thet kep' a-switchin' from side ter side, an' th' critter was a-crawlin', crawlin', down on to little Toby; an' she see it a-pattin' its chin on the ground, an' hitchin' its hind legs up under it, an' a-tremblin', jess ready ter spring! It was that savage old Californy lion!

"It was a desprit thing, but Melissa, she sorter woke up in a minit, an' what do you s'pose she done? Holler, an' run back round the trail? No; she knowed by thet time the lion ud hev little Toby. She let herself down over the edge, hangin' on to the roots o' the madrone, an' when there wa'n't nothin' more ter hang on to, she turned around, with her back ter the bluff, an' let go! Thet's what Melissa done!

"My God, 'twas a ter'ble fall! Fur a little ways she slid down all right, an' then there was a place nearly up an' down, an' she fell 40 feet on to the rocks, an' then rolled, an' tumbled, an' fell again, an' at last dropped inter deep water at the bottom, with a whole slide of rocks an' dirt smashin' after her. Stranger, I never could see how she kin ot alive, but she wa'n't even stunned. She cud swim like a fish, an' she paddled across inter the shaller water, tryin' ter holler all she could. The next minit she was hurryin' Toby up ter th' house, an' the lion was bouncin' off in the brush, pretty well scared, I reckon.

"Char'y an' me, we got home fore long, an' found the child'en all in th' house, an' Melissa settin' down lookin' awful white an' covered with blood, from soratches as we thought. We got some water an' washed her, and then we see she was bleedin' inside. Ever sence that day she hain't been well; sorter pined away like. We tuk her ter town ter the doctor for awhile, but he could't do nothin'. We feel dreadful

sorry 'bout it—can't help it, you see. She used ter be so peart. The next day after it happened I found her bokay of posies lodged in a riddle down the creek. Char'y's got it yet, I reckon."

The mountaineer brushed his cheek again, and smoked rapidly, gazing in the fire. At last he went on:

"The teacher of the school yere has bin awful good to Melissa. She's a young woman from Santa Cruz—what I call one or the fust-best; kind an' pleasant, but lots er spirit, too. You see Melissa wa'n't able ter go ter school, so what does the school ma'am do but come down yere o' Saturdays, or mebbe Sundays, an' talk ter Melissa an' read to her, an' teach her little things about knittin' an' all that. It's done Melissa a heap o' good—sorter cheered her up like. The school ma'am's an awful good young woman."

At this moment the mother came softly forward and leaned over her husband's chair.

"Well, Charity, how's Melissa?"

"She doesn't feel any pain now. She wants to come out and see the stranger."

"So she shall, so she shall," said the mountaineer, rising and placing his pipe on the rude mantel. He went into the adjoining room, and after a time reappeared, bearing in his arms a piteous burden wrapped in a white blanket. So pale and fragile did the sick child appear, that it seemed as if a single rude breath of air might extinguish the flickering spark of life. Her eyes were large and brilliant, and unlike her sisters she had dark hair, which formed a startling contrast to her marble face. Her father held her tenderly as he resumed his seat before the fire. The other children gathered around, silent and on tiptoe. Toby, a sturdy, ruddy boy, stood beside his father, and gently arranged a stray lock of his sister's hair. The stranger recollected that the sister had sacrificed herself for this brother.

"This is my Melissa," said the mountaineer, with assumed cheerfulness. "She wanted ter come out an' see the stranger. Tain't every day that we hev some nn come from town to step in an' tell us the news, is it, little gal? So we mus' make the best of it. The stranger kin way 'om Santa Clara valley on horseback. You jess orter see his horse, Melissa; it's the prettiest critter you ever see. We mus' see him to-morrow mawnin'. He's a dark bay, an' his coat is jess like silk."

"He's gentle, too," said the stranger. "He will follow me about just like a dog. If I get tired riding, I jump off and walk and he follows me until I get ready to ride again. Why, Melissa, he's so gentle that you could ride him, and if he thought you weren't used to being on horseback you'd see how carefully he'd step, so as not to frighten you. My sisters often ride him, and he is always delighted when he sees one of them with her long riding dresses on, because then he knows that he will have a lump of sugar."

Melissa smiled at that.

"Is it warm in Santa Clara?" she asked, in a weak voice, scarcely more than a whisper.

"Yes, it is warm and sunny there, and there are gardens of beautiful flowers and orchards full of fruit. I wish you could come and see us, and my sisters would show you all the pretty places."

"It is very cold here," said poor Melissa.

In a short time she became weary, and her father, with infinite tenderness, carried her back to her room.

"I like the stranger," she whispered in his ear. "I want to see him when he rides away to-morrow."

The stranger was shown to a little, low-roofed bedroom, and when his host had left him, looked curiously about at the queer, home-made furniture and simple ornaments. He extinguished his candle and lay down. Through the little square window he could see somber treetops outlined against a starry sky. The roar of the brawling creek was a lullaby and he slept.

In the night an icy hand clatched his own. His bewildered and awakening senses perceived a tall figure bending over him.

"Stranger," said the hollow voice of the mountaineer, "Melissa's goin'. She's goin' fast." There was inexpressible grief in the tone. "She's bin callin' for the teacher," he went on. "She wants ter see her. Couldn't I git yer ter go up with yer horse an' fetch her down? She's stoppin' to old man Pardee's."

In another moment the stranger was out under the stars. The solemnity of the forest and the night was awful. The old moon hung in the west above the trees. A ghostly breeze passed moaning through the woods. In the dusky shadow, his horse started up at his approach, and met him with a low whinny. He threw the saddle on and mounted.

"'Bout a mile above yere," said a voice from the cabin door. "A house ter yer left with an openin' back of it."

The stranger rode on, over the bridge and along the unknown road. It was very dark among the great trees, but he pushed on rapidly. At last open ground appeared at his left, and a rude, long, low house in gloomy shadow touched with rays of moonlight. He drew rein before the door. Three large animals rushed forward, with deep, hoarse bays and uplifted muzzles. He leaned forward and struck resounding blows on the door. A growling voice was heard within. A light flashed from a window. The door opened, and a tall old man appeared, shading his candle with his hand. A long white beard flowed from beneath his chin, and his

iron gray hair was like a mane. So wrinkled was his face, that it seemed as if centuries and not years had beat upon it. He gazed with astonishment at the mounted stranger looming tall in the moonlight.

"Is this Mr. Pardee?"

"It is, so it is," replied the old man. "What kin' I do fur ye?"

The stranger quickly told his errand. "Sho, now; so the pore little gal is goin' under. It's a great pity, so it is. I'll tell Miss Fairchild to once." The old man disappeared with his light. The stranger dismounted, and the hounds came to lick his hands.

The light reappeared. A pale young lady wrapped in a dark cloak, stepped from the door, and gazed earnestly and anxiously at the stranger.

"Is poor little Melissa worse?" she asked, sorrowfully.

"I fear so. She has asked for you. I came to tell you. Will you mount my horse? You are not afraid to ride?"

"No, if he will carry a woman."

"He has—many times. But the saddle?"

"I can use it without the least difficulty."

He assisted her to mount. She gathered up the reins with a practiced hand, and the next instant had departed at a gallop into the black woods.

"Smart gal, so she is," murmured the old man. "Won't yer come in stranger? We'll hev a fire an' a cup o' coffee."

"No, thank you. I will walk back, now. Good night."

He walked away, escorted by the hounds to the edge of the woods. When he reached the cabin, the moon had sunk, the stars were pale, and the cold dawn was trembling in the sky.

He entered softly. The hour had come. Through an open door he saw the mother seize her husband's arm, and heard her voice in the agony of hope yielding place to despair. But the mountaineer, with the tears running down his sallow cheeks, and in a voice of utterable sorrow, said:

"No, Charity, she's plumb dead now, Charity—she's plumb dead now."

But the pale young teacher, kneeling by the death-bed of poor Melissa, rose up like a comforting angel to whisper sweet words of consolation to the mourning parents. The stranger could only wait silently with reverential wonder to do her bidding, for he was young and had never looked upon sorrow. When the bright morning had come, with all its cheerful sights and sounds, she beckoned him softly to look at the little dead heroine. The face was like marble delicately sculptured, illuminated by a serene smile of indescribable sweetness, as if at the moment of parting the music of celestial choirs had fallen upon her ears.

The stranger reverently gazing could but turn to his pale companion and murmur one word:

"Peace."

The stranger tarried to attend the simple obsequies. From distant mountain ranches and from cabins in the remote woods the sincere and kindly people gathered. There was then no church and no minister in that wild region. An aged man read the burial service, and sweet-voiced children, led by their gentle teacher, sang a hymn for their departed companion.

The mountains are no longer wild and inaccessible. The ax has swept their slopes, and the screaming locomotive rushes through the canyons; but in a dusky clump of fragrant mountain laurels, in peace undisturbed, there is a little green mound, and deeply carved on a mossy trunk the name MELISSA.—C. E. B. in *Oberland* for June.

The Starr-King Monument.

The S. F. Bulletin publishes the following communication from "one who remembers Starr King:"

I learn from the president of the Starr King Monument Association that the funds thus far collected for the purpose of building a monument amount to nearly \$9000, and that a further sum of \$3000 is needed to erect a suitable bronze statue mounted on a granite pedestal and placed in Golden Gate park. Mr. King's patriotic services to our State and nation occurred more than a quarter of a century ago. A new generation of men lives to-day on the scene of his labors. It is, therefore, incumbent on the men who lived in his time to erect the tribute to the memory of this patriot. Can you call the attention of the patriotic citizens of 1860 and 1865 to this matter, that the project may not fail?

The editor observes that the amount wanting would be speedily contributed were those who knew Starr King, and who are fully cognizant of his services to his State and country, to do what every one of them thinks should be done, and confidently affirms that when his friends realize how slight an effort is needed, the money will be forthcoming.

Any subscriptions sent to Mayor Pond, treasurer, or J. B. Stetson, president of the Starr King Monument Association, San Francisco, will be duly acknowledged.

WINTERING MELON-VINES.—"When I was a younger man than I am now," said Mr. E. W. Maclin the other day, "I was once on a visit to an old gentleman who lived on a ranch up in Nevada county. He showed me his trees and vines and at last we came to his water-melon patch. 'I am afraid I won't have a very big crop of melons this year,' he remarked; 'these vines do not appear to be doing very well.' My

sympathy was aroused at once and I thought I would cheer him up a little, and so I said: 'Oh, well, never mind. Take good care of the vines through the winter and perhaps they will do better next year.' I did not at that time understand the pitying look which spread itself over his countenance, but since then I have turned rancher myself."—*Auburn Republican*.

Preached a Funeral.

Young Will Penson, son of old man Bob Penson, sickened and died. Mrs. Penson, the young man's mother, was anxious that a preacher named Dabbs should deliver the funeral oration. Old man Penson went to the preacher and said:

"Parson, my wife is putty nigh dead with grief."

"Yes, brother, I know that."

"An' the children air awfully stirred up."

"Oh, yes, brother," the preacher responded.

"Wall, now," said old Penson, "I'm mighty glad you understand the thing so well, fur in this here funeral ter-do, I don't want nuthin' said that will jerk the pillar out frum under the head uv dozin' grief, an' cause a fresh outbreak."

"I understand that, brother."

"All right, then," said the old man, Penson, "I want you to preach my son's funeral."

The preacher came. The neighbors had come and arrayed themselves into the most dismal of all assemblages—a country funeral. The grief-stricken mother, whose life had been centered in her son, mourned in a corner of the room, and the children, struck with awe, hung back and whispered to each other.

The preacher arose and began to speak of the dead boy; extolled his virtues and spent many words in illustrating his manly qualities. The mother groaned. The preacher, seeming to take encouragement, began to draw about him the mechanical appliances of emotion. The mother shrieked. The friends began to wipe their eyes. The preacher threw himself back and began to paint an awful picture of death, and gave his hearers a startling etching of the necessity of repentance. The mother groaned in anguish. The father ominously shook his head. The preacher raved. He walked the floor and shouted with mourner's bench declamation. The mother fainted. The father shook his head and muttered something.

At the grave the mother had become almost calm; the preacher began to speak of the noble qualities of the boy. The mother fainted again.

One day, two weeks after the burial, old man Penson called on the preacher.

"Why," said the man of text, "I did not expect to see you so soon. Anything you feel like giving me is all right, but we can afford to wait awhile."

"We have waited long enough for what I owe you," said old man Penson. "I owe you a blamed good whuppin' an' it's got to be paid right now."

"Why, I don't understand you, sir."

"Yas, mebbe not, but I understand you. When I axed you to preach the funeral sermon uv my boy you said that you wouldn't stir my folks up. I had talked ter my wife about grace an' resignation till I had got her almost resigned, but you come an' knocked it all down. You told her about despair when I wanted you to tell her about hope. You painted a picture uv what we had lost when I wanted you ter show what our son had gained. Take off your linen, cap'n, fur I'm goin' ter use you rough."

"Why, I surely don't understand you."

"Wall, you will. You shove out the black boxes of sorrow whar you mout unfold the bright packages of hope; you—"

He seized the preacher, choked him, beat him, and then threw him out of the house. Penson was arrested and tried, but the humane jury rendered a verdict to the effect that it is a minister's place to brighten instead of to blacken; that he should console instead of deepen sorrow.—*Arkansas Traveler*.

OBSENE PICTURES AMONG SCHOOL CHILDREN.

—Parents have to keep a close watch over the children, indeed, if they would fully know the various temptations that are thrown in their way. The devil seems to be busying himself nowadays to insnare the youth and secure the ruin, especially, of our young girls. It has got to be quite the thing lately for manufacturers of fancy brands of tobacco, cigars and cigarettes to send over the country whenever their goods go great numbers of photographs representing women and girls in all sorts of positions and situations, from the common, vulgar, to the absolutely indecent and obscene. A teacher caught a boy in the act of presenting one of these "fancy" pictures to a girl on the school-ground in this city the other day. The picture was that of a woman entirely nude, except as to head-gear. The teacher, after taking the picture from the boy, instituted an investigation among the children, and to his astonishment found a dozen more pictures of the same obscene character. The question naturally arises, how do these pictures get into the hands of the school boys? The teachers and parents should forthwith inaugurate a vigorous war upon these pictures and see if they cannot be kept out of the schools. This is a form of wickedness that will do mortal injury if left to run its course.—*Santa Maria Times*.

A BILL has been favorably reported appropriating \$150,000 for a public building in Sacramento.

YOUNG FOLKS' COLUMN.

An Admonition (After Mother Goose.)

[Written for the RURAL PRESS by M. S. P.]

I know a little man, and I know a little girl,
To whom he has given his heart, heart, heart.
He is very often with this dear little girl,
And they don't live so very far apart, part, part.

Now this dear little man had better look out,
Else he'll get punched in his head, head, head;
For she's got another beau who might get mad,
But you needn't tell them what I've said, said, said.

Robbie and the Bear.

The following is for the boys. We find it in an Eastern paper, and if it is not true, it is good enough to be:

During the cold weather of April the two oldest sons of Isaac Roberts, living over at Twin Lake spring, near Northwood, started out for a fox hunt with two sons of a neighbor. They left the Roberts' farmhouse, and just as they were about ready to go, Robbie, a lad of 12, asked them to take him along. The older brothers objected. Nobody wanted to be bothered by a boy tagging along. Besides, there weren't sufficient snowshoes for all, and the big boys couldn't get along without the shoes.

The father, willing to humor the youngest of the family, told them to take him along and put him on a runaway with "the old musket." The old musket is a feature of every farmhouse up this way. It can be purchased for \$2.50, and it shoots No. 10 snipeshot and 000 buckshot with equal inaccuracy. Accordingly Robbie was armed with the musket, which he carefully loaded with about a handful of powder and buckshot, and after rolling up an old blanket to put around him while waiting on a runaway, he started off with the boys. Although he could keep a runaway as good as a man, the older boys were provoked at having their father insist on sending the boy, and they therefore posted him when about two miles from home at the foot of a ridge, in about the last place a fox, even when driven to desperation, would be likely to run. Foxes naturally take to the top of a ridge. But it was on the sunny side of the ridge and was a comfortable place to stay, and Robbie didn't know but that it was all right.

Leaving the boy hidden, as they told him, among the bushes at the roots of a hemlock stump, the elder lads went on to enjoy their fox hunt, and for the next hour Robbie heard nothing of them. By that time, he had got tired of sitting still, and ventured very cautiously at first to stir around a little. First he moved from the shady to the sunny side of the stump, then he climbed on to the log. About this time he heard the dogs a long way off in full chorus. He grabbed the old musket with firmer hand than he cocked it ready for action, but the hounds passed out of hearing along the top of the next big ridge, nearly a mile away, and Robbie saw nothing of the hounds or fox.

However, he expected the fox to turn on them pretty soon, and come sneaking back, down across the hollow, as the lads had said it would do, along the very hemlock log; and so a short time after the hounds were gone, Robbie was not at all astonished to hear something on the crust of the snow, down in the thicket toward the brook, and later to catch a glimpse of something black coming right toward the top of the hemlock tree he was guarding. The tree had been cut the summer before and the limbs were all there, but he could see the thing was black. That pleased Robbie all the more; a black fox would bring an immense price. But the noise was all too great for a fox, and Robbie noticed this, but only with curiosity. Pretty soon the beast came around the old top, and walked out in plain view.

It was a bear a year old. Seeing Robbie with gun up it stopped and equatted down on its haunches and stared as if in amazement, but not for any length of time. Robbie had a deadly aim across his knee and pulled the trigger. The roar of the old musket was heard at the Roberts' home, two miles away. Robbie tumbled off the log instead of the bear as if he had been shot. But the bear, which was only about three rods away, had seven buckshot in him, one of which pierced his brain, while Robbie had merely a black and blue bruise on his shoulder, which he now speaks of with pride. Another buckshot had opened the bear's carotid artery and it bled freely. This suggested a joke to Robbie. By the aid of a broken limb, which he used as a handspike, he rolled the bear against the log and then covered it with snow, leaving the blood plainly showing on the snow where the bear fell. Then he wet his cap and the musket in the blood, threw them down on the ground and scampered off for home.

Five or six hours later the big boys came along on their way home. They had tried two foxes, but both had run into rocky holes from which neither pickax nor fire could dislodge them. The boys were tired and discouraged. It was too bad, they thought, to have to go out of their way to pick up Robbie. Reaching the old hemlock, they saw the blood, the stained gun and the soaked cap, but did not see Robbie's tracks homeward bound, because he had followed the trail made when coming. To say that they were horrified scarcely hints at their feelings. Both brothers burst into tears.

"A panther did it," said one, "and buried him here."

They began to dig him out, and then, to their surprise, they uncovered the bloody head of a bear. They dug out the brute and then searched around for Robbie without avail. Not yet reassured, but hoping he might have gone home, they hastened away to find their hopes well founded. The bear was thin and weighed but a little over 100 pounds. It had been on the other side of the brook from Robbie and had gone his way when he heard the hounds.

A WISE TEACHER'S TALK ON HUMANITY.—A boy in school was having a very funny time by sticking a pin into the legs of the boy who sat next him and laughing at his antics. The teacher caught a sight of the proceeding, and taking a pin went to the first mentioned boy and said: "Would you like to have a pin stuck into you like that?" He laughed as though he thought it might be a capital joke, whereat the teacher used the pin rather freely, and his jumpings and squirmings, accompanied by his "Ows!" and endeavors to save himself by the use of his hands, attracted the attention of the whole school. The teacher finally asked him what was the matter, and why he did not sit quietly, and when he stated that he couldn't, "it hurt so." The teacher said: "Well, that is just the way it feels to other people. Have you had enough of it?" He was very decided in his opinion that he had, and the teacher took occasion to say a few words to the school in regard to their treatment, not only of each other, but of the lower animals. She said: "I saw a boy kill a toad last night, and I wondered if he knew the toad was a help to us, and if he thought of the toad's sufferings." Most of the boys looked thoughtful, a few laughed, and the very boy that killed the toad raised his hand and said: "What good can a toad do?" Upon the teacher's inquiry among the scholars she found that only a few knew anything of the good that a toad does in the garden. It was the means of a reform in that direction, and a talk on the uses of birds revealed the fact that very few of them knew that a bird is of any use whatever.—*Philadelphia Call*.

GOOD HEALTH.

For Sprains.

EDITORS PRESS:—Take the strongest vinegar you can get; add all the salt it will dissolve. Heat and saturate flannel cloths, and apply to the hurt as hot as the patient can bear. Then envelop in dry flannel. Repeat the process every 10 or 15 minutes until the pain is relieved. As one of my ankles is just recovering from a severe sprain, I can testify with a clear conscience to the efficacy of this remedy. We have used it in our family ever since I can remember.—D. J. O., *Spadra, Cal.*

GOOD AND BAD NEWS.—Good and bad news has a contrary action on the heart. Bad news weakens the action of the heart, oppresses the lungs, destroys the appetite, stops the digestion and partially suspends all the functions of the system. An emotion of shame flushes the face; fear blanches, joy illuminates it, and an instant thrill electrifies a million of nerves. Surprise spurs the pulse into a gallop. Delirium infuses great energy. Volition commands, and hundreds of muscles spring to excite. Powerful emotions often kill the body at a stroke. Chilo, Liagoras and Sophocles died of joy at the Grecian games. The news of defeat killed Philip V. One of the Popes died of an emotion of the ludicrous on seeing his pet monkey robed in pontificals, occupying the Chair of State. The Doorkeeper of Congress expired on hearing of the surrender of Cornwallis. Eminent public speakers have often died in the midst of an impassioned burst of eloquence, or when the deep emotion that produced it has suddenly subsided. Lagrave, the young Parisian, died when he heard that the musical prize for which he had competed was adjudged to another.

BIRD SKINS AS GRAFTS FOR WOUNDS ON HUMAN BEINGS.—Dr. Redard has communicated to the Paris Academy of Medicine some observations regarding the advantages of the skin of birds for grafts on wounds of human beings. He takes the skin from beneath the wing of a chicken, carefully securing the adjacent cellular tissue, but avoiding the adipose tissue. The transplanted pieces varied from a sixth to a third of an inch in size, and they were maintained in position by means of a little cotton wool and iodoform gauze. The skin of birds and fowls has the advantage of being supple, delicate and vascular, and is readily adapted to the surface of a wound, where it adheres without undergoing absorption. In a case of severe burn of the scalp, of eight months' standing, in a child two years old, he obtained rapid cicatrization by means of grafts from a fowl. The wound measured 3 inches by 2½, and completely healed in two months.

INTELLECTUAL LABOR AND LONG LIFE.—Among artists, Michar Angelo lived to be 90, Sir Christopher Wren to be 91. Titian is said to have been engaged in painting a picture now in the Academy at Venice where he was cut off by the plague at 99 years of age! Conrad Roesel of the Hague, who lived to be 100, and Ingres to 86, Tintoretto 82, Claude Lorraine 82,

Greuze 79, David 77, Turner 76, Horace Vernet 73, Lebrun 71, Poussin 71, are instances only of greatness in art, but greatness in enduring vitality. If we take poets, we find that Rogers lived to be 93, Sophocles 90, Colderon 87, Juvenal 86, Anacreon 85, Voltaire 84, Metastasio 84, Euripides 78, Goethe 83, Klopstock 79, Wieland 80, Lamartine 78, Beranger 77, and Victor Hugo 83. If we turn to philosophers and men of science we find among our contemporaries M. Chevreul, the French philosopher and chemist, who on the evening of his one hundredth birthday occupied the President's box at the opera; and if we look into the past we find the names of Fontenelle, who died at 100; Hoyle (who wrote the treatise on whist) at 98, Hobbes at 92, Morgagni at 89, Ried at 86, Dr. Heberden at 90, Sir T. Watson at 90 (?), Sir William Lawrence at 84, Royer-Collard at 82, William Harvey at 80, Schelling at 79, Cousin at 76, and, greatest of all, Plato at 82; and among great composers, Auber died at 88, Cherubini at 82, Rossini 77, Haydn 77, Gluck 79, and Meyerbeer 72. What a stupendous amount of brainwork, and brainwork of the highest kind, is represented by these names, all of whom exceeded the allotted threescore years and ten, but who are lost sight of in the delusive method of averages! Of the longevity of judges and dignitaries of the church, who also represent a great amount of useful brainwork, evidence has already been given.—*Nineteenth Century*.

DOMESTIC ECONOMY.

Cooking German Carp.

EDITORS PRESS:—In writing about the German carp, Mr. Wier says he cannot tell how to cook them so as to be palatable. As I have had a little experience I will tell how I manage them.

As soon after they are caught as possible they should be put in a tub or canful of fresh water and left to stand an hour or two, after which the water should be changed and left on them another hour. Then, if they are cleaned and put into some nice fresh water with a little salt in it, and left in that all night, they will have lost all that muddy taste which is so unpleasant.

Then I take an iron bake-pan and put them in, heads and tails, as close as I can pack them—two layers deep, if I have that many, and season them well with pepper and salt. Half fill the pan with water; cover it, if you can, with another pan or something, and set them in the oven and bake two or three hours, taking care that a little water is always in the pan until time is almost up. Then take off the cover and let them brown a little. The bones will all be soft and the meat first class in flavor. All this seems like a good deal of trouble, but it is not much trouble to fish-lovers. And as to those of us who live far from fish markets, a good mess of carp, cooked as above described, will be relished by all. MRS. J. HILTON.

BUTTERMILK BISCUIT.—Three cups of buttermilk, one cup of butter, one teaspoonful of cream of tartar, half a teaspoonful of soda, a dessert-spoonful of salt and flour enough to make the dough just stiff enough to be rolled out.

JELLY PIE.—One cup of jelly, two cups of sugar, four eggs, half a cup of butter, cream the sugar and butter, add the well-beaten yolks of the eggs, then the whites, and last the jelly, flavor with orange, and bake about three-quarters of an hour.

DOUGHNUTS.—Two cups of water, one cup of sugar, two tablespoonfuls of shortening, one quart of sifted flour, two tablespoonfuls of baking powder, or two tablespoonfuls of cream of tartar and one tablespoonful of soda and a pinch of salt. Flavor to taste.

GERMAN TOAST.—Cut in thin slices a loaf of bread, soak half an hour in sweet milk; beat two eggs, a small spoonful of butter, a tablespoonful of cornstarch in milk, and after taking the slices out of the milk dip them in this mixture and fry brown; sprinkle with sugar and cinnamon.

SNOW PUDDING.—One-half a box of gelatine in a pint of boiling water; when dissolved and nearly cold beat briskly with the whites of four eggs two cups of coffee sugar and the juice of a lemon; make a custard of the yolks and pour over it; add the grated rind of the lemon to the custard.

MINCED BEEF.—Three pounds of raw beef chopped fine; five soda crackers rolled fine, two eggs well beaten, 1½ teaspoonfuls of pepper, three slices of pork chopped, one-half cup of milk, and salt to taste. Mix all thoroughly, make into a loaf. Bake two hours. This should be sliced cold for tea or luncheon.

ROAST PIGEONS.—Pick, draw and truss them, keeping on the feet; chop the liver with some parsley, add crumbs of bread, pepper, salt and a little butter; put this dressing inside; slit one of the legs and slip the other through it; skewer and roast for half an hour; baste them well with butter. Serve with bread sauce.

OATMEAL GRIDDLE CAKES.—To a pint bowl of cold oatmeal mush, stir in about a half a cup of hot water (use only enough to moisten it and beat smooth), add three eggs, beaten light; add cold milk to make a thin batter, one teaspoon of baking powder, one-half cup of flour; if they break in baking add more flour. Bake on a griddle.

The Week.

Our April weather is appearing late in May. Surely the weather clerk has slipped his calendar back a peg. We expect "hay rains," of course, but not in such measure and over such a wide area as this year. If the refreshing had come six weeks earlier it would have reclaimed much lost grain, which it is now too late to save, but, as it is, the showers and the lowering weather have accomplished considerable—though not nearly so much as the hay and grain-buyers and the bag-sellers would have us believe. But let it improve the outlook as much as it can, it is not likely to make it any too good this year. Some damage has been done to hay, and possibly some to ripening cherries, which may burst their jackets; but, on the whole, it does not appear that even late May rains are objected to seriously.

The grand gala season of the schools and colleges is in the full, and the "sweet girl graduate" and the brand-new men are all about us. Our private schools seem to be thriving with the good times and the increase in population. May they never grow less.

On the Thirtieth of May.

We go to press Decoration Day under dripping clouds. Such weather, rare indeed in California at the close of May, is common enough in the older States when the G. A. R. goes marching out to the cemeteries to strew memorial blossoms on comrades' graves, and perhaps to this reminder of the Eastern climes—wherein the war for the union was chiefly waged—may be partly due the unusually deep and lively sense of the anniversary's import which to-day moves one, born and raised in New England, who five and twenty years ago was wearing army blue in the Old Dominion.

It may well be that hearts as truly patriotic beat beneath some butternut as beneath some indigo blouses, and we are now a re-united people, and the animosities attendant upon war are never to be rekindled; but the great distinctive principle for whose vindication the war was fought to its victorious close—the principle of National unity, established through so vast and precious sacrifice, must never be let go nor lost sight of in our thought. Extinct be sectional selfishness and party ambitions; and as our great National holidays come round, may we—old and young—be uplifted in spirit to a grander sense of America's place and mission in the great family of mankind.

As love of home and family may, in time of national peril, become as naught and be swallowed up in love of country (as it was here in rebellion time), yet be none the less real; so there is a patriotism which, with all its pride in native land and all its self-devotion to her service, is yet in nowise narrow nor provincial, but subordinates love of country to love of man—a patriotism which is perfectly genuine, yet merges in humanity.

Amid the waxing ferment and clamor of a presidential year; and in view of the larger problems, ethnic and economic, which come to the surface in labor movements, socialistic agitations, and diplomatic and ecclesiastical workings the world over, let us cultivate in ourselves and encourage in one another that soldierly temper and frame which recognizes the truth that we are not our own, our party's, nor even our country's, but owe a still higher allegiance to Truth and Right.

In the spirit of that paramount loyalty to the Most High are the patriotic words of George Wm. Curtis, which thrilled the wires last night from ocean to ocean, and stir true hearts to-day throughout Columbia: "The course of American history does not depend upon Presidents, but upon the people. * * * Conventions may well heed the memory of that host of heroes whose graves to-morrow will be strewn with flowers. In no country was there ever a more beautiful benediction upon patriotism or a more touching tribute of National gratitude. It was country, not party; it was duty, not ambition; it was liberty, and union, the impregnable bulwark of liberty, for which they made the costly sacrifice. They were patriots to whom America meant not only nationality and justice and equality and obedience to law, but also political progress, the righting of public wrongs, the ability of the people to see their own errors and constantly to strengthen by purifying their own Government. They died to serve these great ends. Let us live to serve them as we scatter flowers upon their graves. Let us baptize ourselves in their spirit and with their abiding faith in the people, seeing everywhere the signs that the America of their hope shall be the America of our children."

RUSSIA seems to be ahead of us in some things. For instance, while in New York State the bull-butterfacturers are asserting that they have a right to space at the Exhibition of Food Products in Albany next September, and are bulldozing the Attorney-General about it, word comes from Moscow that several wealthy merchants of that city having been convicted of adulterating tea, one of them has been deprived of his civil rights and banished to Siberia for life, and others sentenced to different terms.

FINE GOOSEBERRIES.—We have received from James Galloway of Haywards a sample of fine large gooseberries, wholly free from mildew, which he is growing from cuttings received from his uncle's garden in Dublin, Ireland, and which he calls "Royal Giant." He thinks so well of the variety that he proposes to offer the cuttings for sale next spring.

Eastern Shipment of Fruit.

The California Fruit Union, at the meeting of its directors in Sacramento last Saturday, gave final form to the arrangements of this season's business. Most of the day was given to the discussion of the two following resolutions, which were finally adopted.

1. The auction plan exclusively shall be tried in Chicago as long as in the discretion of the Executive Committee it is in the interest of the Fruit Union to do so. And our agents have the privilege of withdrawing any line of goods, should bids for same be less than the limit fixed by the owner, and may afterward offer the same at private sale.

2. That any member of the Fruit Union be allowed to attach any car to the Union's trains when presenting an affidavit and other satisfactory evidence that the same has been actually sold, upon the payment to the Union of the sum of \$30 for each car so offered, said payment to be made in advance of shipment; the shipper to pay also to the manager any sum paid by the Union for expedited service on such cars in advance, timely notice to be given to the manager of the intention to ship such cars.

The adoption of the first resolution insures a trial of the auction plan of sale at Chicago, and the fact that Capt. Weinstock was selected as Eastern manager, upon the resignation of the place by Mr. Hatch, especially insures the full and fair trial of the auction method, because Capt. Weinstock proposed it, and fully believes in its efficacy. Capt. Weinstock goes East to perform this duty without compensation, merely taking the cost of his expenses from the union. This decision seems final, for it was telegraphed from Sacramento on Tuesday that Porter Brothers have been appointed the Chicago agents for the California Fruit Union, and have signed a contract to handle no fruits save by the auction plan. Mr. Weinstock started for Chicago Tuesday evening.

The adoption of the second resolution presents a way in which cars of fruit may be sent East and escape the sale by the Union and still secure the low rates of freight pertaining to train-loads. It is expected that purchasers for such car lots of fruit will be chiefly in cities where the Union has no agent, and thus the general distribution will be promoted.

The prospect now is that there will be large amounts of fruit sent East this year, and it is hoped a wider scattering of it than heretofore.

SWEET POTATO VARIETIES.—Prof. Hilgard has received a letter from Dr. E. L. Sturtevant of South Framingham, Mass., asking for samples of California-grown sweet potato plant and tuber to aid him in the preparation of a monograph on the sweet potato, which he now has in preparation. Dr. Sturtevant writes that he has heard that several varieties of peculiar excellence are grown in California, and he is naturally anxious to include them in his study of the subject. He desires both the potato itself and a specimen of the foliage. We make this notice of Dr. Sturtevant's request because we think by calling attention of our readers to the subject better samples can be had than by collecting them in San Francisco. It is not necessary that the largest tubers be sent, but those that fairly represent the product of any variety, and if growers will take and press specimens of the foliage when it is at its best, and take the tubers later, perhaps, very interesting samples can be had. Sweet potato growers who will aid Dr. Sturtevant in this interesting effort may write to him about packing and forwarding of samples. We have long known Dr. Sturtevant as a painstaking investigator and an acknowledged authority on agricultural matters, and we would like to have him secure all the California agricultural material he can use.

NEW ZEALAND APPLES.—A few days since Mr. F. Canham called our attention to some shapely and handsomely colored apples at his snug little fruit-shop opposite the Palace hotel. On trial they proved to be not only good looking, but firm and well flavored; and they had come all the way from Pokeno, Auckland, N. Z., where they grew this A. D. 1888.

THE PERMANENT EXHIBIT AT SACRAMENTO.—The Sacramento Improvement Association has decided to open the new Exhibition Building Saturday evening, June 21, when displays will be made of the products of farm, vineyard and orchard by many of the Northern California counties. There are to be appropriate exercises afternoon and evening.

Savings in California.

The American Agriculturist for June makes an allusion to California which may be of great value to us in inducing competent and thrifty laboring people to think about our State as a future home. The following is the allusion made:

The returns of savings banks from California lead the list, the average being \$788 for each depositor. In France more than 2,000,000 depositors are credited with \$503 each. In Rhode Island the average is \$501; in Vermont, \$361. New York has an average of \$349, and New Hampshire, \$335; Massachusetts has \$309; Maine, \$328, and Connecticut, \$255. France, as is well known, is one of the most thrifty countries in the world, and the saving habits of her laboring classes are remarkable. The large average shown by California is proof of the claim that is so often put forward for that State, that wages are as a rule higher there than elsewhere, and that the expense of living, particularly of food, is less than on the Atlantic sea-board, and that the climate is such that labor is employed during all the year. There are none of those long breaks in employment which occur in the States of the eastern and central parts of the Union. The grain-fields are plowed and sown between November and February, then follows the care of orchard or vineyard, until the period of haying and harvest in May. This harvest period lasts along until it rounds out the year in October.

These are really the facts in the case, and, to use a peculiar phrase, they are rapidly becoming more so. The securing labor in the orchards and in other agricultural enterprises, sometimes however secures a change of location more or less great, to secure employment. This is however becoming less year by year, as the fruit area is extending farther into the grain regions. It is a fact that laborers are well paid in California—better paid than anywhere else in the world, and if a man will let whisky alone and stand to his employer with loyalty, he can enroll himself very soon in the ranks of savings bank depositors. California is a good place for a good laboring man—and for his sisters and his cousins and his aunts. One of the crying needs of the State in city and country, is a supply of faithful and loyal maid servants, and such can get wages far above anything they can command elsewhere. We can hardly have too many laboring men and women if they are of the right kind, but if they are strikers or drinkers or unwilling to render fair service for liberal pay, this State is too small for a single one more of them.

THE LUSK CANNERY TO CONTINUE.—At the assignee's sale on Tuesday of this week, a syndicate, composed of Sydney M. Smith, president of the Cutting Packing Company, Jacob Levi of H. Levi & Co., George C. Moore of E. L. G. Steele & Co., and Isadore Jacobs of A. Lusk & Co., purchased the property of the bankrupt J. Lusk Canning Company for \$48,000. The property transferred consisted of nine acres of real estate at Temescal, with factory and all pertaining; 24 acres of growing crops, factory buildings and plant at San Lorenzo, valuable labels, etc. By the terms of sale the outstanding contracts for fruit might be accepted or rejected by the purchasers. As we go to press on Wednesday afternoon it does not appear that this matter is decided, and the contracts are probably still hanging between the assignee and the owners of the plant, though decision will not be long deferred. Different opinions are expressed as to whether the syndicate will prefer to escape fulfilling the contracts of the Lusk Company or deem it advantageous to secure them.

REDUCING FREIGHT RATES.—A material reduction of rates on hay, grain and vegetables from all points on the northern division of the Southern Pacific to San Francisco is announced. Some weeks ago the R. R. Commissioners called the company's attention to the fact that the freight charges on these commodities were much too high and a 10 per cent reduction was asked for. On the 28th ult. Secretary Gaskill received a letter from Freight Agent Martin inclosing a copy of a new schedule to go into effect June 1st, showing a reduction of from 8 to 10 per cent. From Gilroy the new rate is \$2.40 a ton; Sargent's, \$2.50; Miller's, \$2.50; Watsonville, \$2.85, and Aptos, \$3. The stations south of Gilroy send the greatest quantity of grain and hay to this city, and as the reductions from those points are more marked than from points north of Gilroy, the farmers and shippers there will now be able to market their produce to advantage.

At the Presidio.

No doubt many of our readers have heard of the Presidio of San Francisco, but few know of the many interesting and beautiful scenes which are to be found there. The Presidio is of course one of the spots where grim-visaged war holds sway and where Uncle Sam puts on his most austere countenance, and yet in times of peace (may they never end) the Presidio has charms which even a "peace commissioner" might heartily enjoy. In fact, the U. S. reservation is one of the most charming places of public resort in the city of San Francisco.

And yet there much of the "pomp and circumstance of glorious war"—just enough to fire the soldier's heart and to inspire the young with dreams of prowess. There are now quar-

and the Government intends the people to enjoy it. Every Friday afternoon the band plays in the neat pavilion shown in the engraving, and the walks are filled with gaily dressed visitors. The scene is only rivaled by the brilliant Saturday afternoons at the Golden Gate Park. Besides the handsome trees shown in the picture, the Government has made extensive plantations in the interest of arboriculture, and many lessons in tree growth on sandy sites may be learned by the forester.

The site shown in the picture is just in front of the officers' residences, which are upon the right of the picture. Continuing directly backward from the pavilion, as shown in the picture, is the alameda, a beautiful shady walk which leads to the official headquarters. There is quite a little city of buildings on the Presidio

lodgings for the soldiers. A short distance from the Presidio was the *castillo* or fort. That at San Francisco was regarded as the most formidable, but in the present age would be in the way as a heap of rubbish. When General Figueroa was Governor of California he issued an edict to the commander of this Presidio not to grant or sell any lands around the station, the included portion being kept solely for the use of the Government. The United States Government has perpetuated the ordinance. Until the coming of General Howard the Presidio was headquarters of the Division of the Pacific, but to secure better accommodation and for convenience in transaction of business, the Division headquarters are now established in the Phelan building on Market street, in San Francisco. It is the idea to make the Presidio

ENTOMOLOGICAL.

The Plum Curculio.

EDITORS PRESS:—Will this pest ever reach California is the question. This question was asked of the writer by Prof. Van Deman, U. S. Pomologist, last winter, he being aware that I had made that insect a special study for years. The question is a hard one to answer, and the best answer I can now give is, that it will be in due course of time. At least, after due consideration of the habits of the insect, I will say that it will be introduced, and that it is most certainly strange that it was not introduced into California years ago, or so soon as any shipments were made by the transcontinental railroads. For, as is well known, this beetle changes from the larva in autumn, and the beetle at once seeks a cover in which to

A GLIMPSE OF THE PRESIDIO GROUNDS, SAN FRANCISCO.

tered at the Presidio five batteries of the First U. S. Heavy Artillery, each battery with three officers and 35 men; one battery of light artillery mounted, with four officers and 67 men; two troops of the 2d U. S. Cavalry, each with three officers and 65 men, and two companies of the First Infantry, each with three officers and 35 men. In command is Col. W. Graham, Brvt.-General.

The evolutions of these troops will always interest the visitor. The day opens with dress parade at 9 o'clock, though just at present being the target season the booming begins at 7 o'clock and continues until 11 o'clock. After July 1st the target practice will be abandoned, and then daily drills will be held each day, except Sunday, from 10 to 11:30 A. M. Guard mounting takes place each day after dress parade. Every Sunday morning the troops are inspected. So much for the formal martial exercises.

Our engraving shows the more peaceful features of the Presidio. Were it not for the serried rows of iron cannon balls, each eight inches in diameter, which line the walks and roadways, the scene might be taken for a pleasure garden. Such, in fact, it is in times of peace

reservation. Besides the handsome residences of the officers and the headquarters, there are the officers' club-house, the recreation building, the court-room, the church, the school-house, the library, the offices of the engineer the quartermaster and the commissary, the commodious barracks of the soldiers. In other parts of the grounds there are the guard-house, the magazines for ammunition, etc. All these details of the establishment will have interest to the visitor, and our readers who come to see the sights of San Francisco should not forget the Presidio.

The history of the Presidio is interesting in this connection. Under the old Mexican rule Upper California was divided into four military districts, the headquarters of which were denominated the Presidio of the district or jurisdiction. At each, troops were stationed. These presidencies or presidios were San Francisco, Monterey, Santa Barbara and San Diego. The buildings were alike in all and consisted of a square of about 100 yards east, inclosed by a wall of unburnt bricks called *adobes*, about four yards in height; within was the church, the residence of the commandante, a warehouse and

the great barracks for the troops of this division, and possibly as many as 5000 men may in the future be quartered there.

EMANCIPATION IN BRAZIL.—The Brazilian Parliament has approved the Government bill completely abolishing slavery, and it was sanctioned by the Regent on the 13th of May. This action met with extraordinary manifestations of rejoicing. President Cleveland sent the Brazilian Minister of Foreign Affairs a congratulatory dispatch upon the occasion, adding an expression of personal hope and expectation that the freedom thus extended will result in the increased happiness and prosperity of the empire.

HAMBERG, one of the men who swindled the Oregon farmer, F. M. Parker, out of his ranch, has been sentenced to one year in jail and a fine of \$19,000; in default of payment he is to be imprisoned in jail at the rate of one day for each dollar, or a term of 53 years. W. J. Pilcher, one of Hamburg's partners in the plot, received a year's sentence, with \$5000 fine, and Walter Neustadt, the other, a \$3000 fine with the same term of imprisonment.

hibernate during winter. As Prof. Riley says: "She seeks any kind of suitable shelter in which to hibernate during winter." Therefore, it would be strange if she did not seek shelter in some of the varied and most suitable things for that purpose of shelter, and he skipped here during winter in some of them?

But this is not saying that California will, at some future time, be scourged by this most noxious insect to the grower of stone fruits, for there are other points having a strong bearing on this question. I for one don't believe that the plum curculio could survive and propagate its kind in this climate, for the following reasons: It has been proven that this beetle whenever the weather is mild in winter leaves its hibernating shelter to feed. In the Eastern States the temperature in winter is seldom warm enough for it to do this, while here, nearly every day in winter time is warm enough for it to do so, therefore it is reasonable to suppose that if they are active and feeding all winter, that they would become exhausted and die of old age before there was any fruit large enough for her to deposit her eggs in.

This is no fanciful idea, but is a reasonable one to all who have given attention to the life and habits of insects. Such students have learned that it is a fact that they can only live in the active state for a certain limited period, and during that period they must feed (if they feed at all in the adult form), lay their eggs and die. Then it follows that if the plum curculio can

only live a month after leaving her winter quarters, then by change of climate, if she leaves her winter quarters three months before there are any fruits ready to receive her eggs, she must die before laying them.

The best answer we can give then to Professor Van Daman's question is that we in California need have little fear of the introduction of the plum curculio unless she changes her habits. If she could breed in this climate she would have been here long ago.

D. B. WIER.

115 Montgomery street, S. F.

This statement will be read with deep interest by our growers of plums and prunes. Mr. Wier has been known for years as a curculio expert throughout the Eastern States. We hope that his diagnosis of the reasons why the beetle cannot succeed in this climate my prove everlastingly true.

The Plum Aphid.

EDITORS PRESS:—Will some of your readers please say what is the best mode of clearing off the green lice from the under side of plum tree leaves.—C. R., Martinez.

Among the washes being tested this week on the plum trees of the University orchard the Ongerth wash, one part to ten of water, seems to work perfectly when the spraying is thorough. The aphid is easy to kill if you touch it, and we have no doubt other preparations will also succeed. Time enough has not elapsed to determine whether any harm will be done to the fruit.

State Inspector Klee, in his last bulletin, recommends the following for plum aphid and woolly aphid, above ground: Four pounds of resin; three pounds of sal-soda; water to make 4½ gallons. Dissolve the sal-soda in a few pints of water; when thoroughly dissolved, add the resin. Heat until dissolved, and add water finally. Use 1½ pints of solution to the gallon of water. Use a temperature of about 100° Fahrenheit.

The Melbourne Exhibition.

Frank McCoppin, United States Commissioner to the Melbourne Exposition, has issued the appended circular for the guidance of persons who contemplate sending exhibits to the exposition:

OFFICE OF THE COMMISSIONER FOR THE UNITED STATES TO THE MELBOURNE EXPOSITION,
312 California street, San Francisco, May 10, 1888.

Gentlemen: The United States Government has made an appropriation of \$50,000 toward the expenses of the American Department at the International Exposition to be held at Melbourne, Victoria, opening on the 1st of August and continuing until the 1st of January next. The President has appointed the undersigned as United States Commissioner to this exposition and placed at my disposal the balance of the appropriation, viz.: \$27,000, to be disbursed at Melbourne for the purpose of giving every advantage to the United States Department that can possibly be obtained by liberal display in arrangement and decoration.

Communications have been entered into with the agents of the Oceanic Steamship Company in this city, who have arranged that all shipments for exhibition shall be taken at a reduction of 50 per cent on ordinary rates.

A special rate of \$300 for the passage from this port to Sydney and return has been made by the Oceanic Steamship Company, good for return in eight months.

It is important to understand that shipments to leave by the steamers of May 31st or June 28th—the earlier the better.

Exhibits of raisins and other dried fruits which may not be ready for shipment until the product of the present season is harvested may be shipped as late as the steamer of September 20th. Spice will be reserved for these exhibits if notice be given in time, and the finest display possible will be made by the commission at Melbourne, considering that they will not arrive at the exposition building before October 20th, and that there will be only 70 days from that date until the close of the exposition.

A liberal appropriation of space has been made by the Victorian Government for the accommodation of American exhibitors. Intending exhibitors who have no agents in Melbourne can consign their exhibits to the Commissioner of the United States for the exposition at Melbourne, who will take charge of and attend to their proper disposition.

The exposition building, for the convenience of foreign exhibitors, has been declared a bonded warehouse, and all goods will be received without payment of duties, and unless sold—in which case local duties will be charged—will be returned to the owner in bond.

The attention of the citizens of the Pacific Coast is earnestly solicited that they should exert themselves to the utmost, during the short time of the commission in this city, to procure for the United States Department as abundant a display of the manufactures and products of the country as practicable.

The merchants of San Francisco have organized a committee to assist the commissioner in obtaining exhibits, as follows: Chamber of Commerce—Hugh Craig, F. A. Haber and I. C. Moore; Board of Trade—George W. Meade, J. B. Stinson and Eugene Beck; Produce Exchange—R. B. Forman, Byron F. Stone and C. F. Bassett; Manufacturers' Association—William Harney, Charles J. Woodbury and Isaac Hight; Mechanics' Institute—David Kerr, George H. Hopps and Irving C. Stump. Hugh Craig, 312 California street, is the chairman of this committee.

These gentlemen have expressed their desire to assist in forwarding the interests of the commission, and will be pleased to facilitate the forwarding of exhibits if notified thereof, and answer any inquiries regarding the same. Your obedient servant,

FRANK MCCOPPIN.

FRUIT MARKETING.

The Supreme Court on 'Fruit Sold by Contract.

The selling of fruit by contract is so generally indulged in and all the laws bearing thereupon are of such interest to our wide community of fruit-growers that we give in full the following decision of the Supreme Court in the case of Blackwood vs. Cutting Packing Company, which was handed down May 19, 1888. It is long, but should be read and preserved by all orchardists:

Action for the price of apricots alleged to have been sold to defendant. Defense, the breach of an implied warranty as to quality.

The contract was in two parts. The part signed by the defendant was as follows:

"SAN FRANCISCO, Sept. 17, 1881.

"Bought of W. C. Blackwood his crop of apricots, at Haywards, for the seasons of 1882-83-84-85-86, not less than 75 tons and not exceeding 200 tons per annum at three cents per pound, f. o. b. (free on board cars at) Haywards.

"CUTTING PACKING COMPANY,

"By A. D. CUTLER."

The part signed by the plaintiff was similar to the above, except that it said "sold my crop of apricots," and "sold Cutting Packing Company."

The court below gave judgment for the defendant, and the plaintiff appeals.

1. The first question is, whether there was any warranty. The defendant relies upon Section 1768 of the Civil Code, which is as follows:

Section 1768: "One who agrees to sell merchandise not then in existence thereby warrants that it shall be sound and merchantable at the place of production contemplated by the parties and as nearly so at the place of delivery as can be secured by reasonable care."

The plaintiff contends in the first place that apricots are not "merchandise." A walk through the markets would probably convince him that he is mistaken. It is said, however, that such fruit comes under the head of "produce." Very likely it does; but we think the word "merchandise" is used in the above section in a large sense, and covers all kind of personal property which is ordinarily bought and sold in the market. Whether it covers more than that need not be decided in this case. This point of plaintiff is not unlike saying that a promissory note between farmers is not a negotiable instrument, because such an instrument is a creation of the law between "merchants."

And we think also that the future crops of fruit come under the head of merchandise "not then in existence." Section 1770 covers the case of an article manufactured to order; and Section 1771, the case of merchandise "inaccessible to the examination of the buyer," which probably refers to merchandise in existence. Taking the three sections together, we think that the one above quoted applies to a case like the present.

It is argued for the plaintiff, however, that the transaction was a sale and not an agreement to sell, and that, therefore, the section does not apply.

The fundamental difference between a sale, properly so called, and an agreement to sell is that in the former case the title passes and in the latter case it does not. The inquiry in this regard, therefore, must be as to whether the title passed. And it is to be observed that the point of time to which the inquiry must relate in the present case is the time the contract was entered into.

Some question is made by counsel as to whether the title to a thing which is not in existence can pass. But we shall assume in favor of the plaintiff that the fruit to be produced from trees already grown and the property of the plaintiff has such a potential existence as to be the subject of sale.

It seems well settled that the question as to whether the title has passed is one as to the intention of the parties. And such intention is, as a matter of course, to be gathered from the language of the parties considered in the light of all the circumstances of the case. But in the absence of anything showing a contrary intent, there are certain circumstances which have a controlling force, and these exist in the present case.

(a) There was at the time to which the inquiry relates neither delivery of the goods nor payment of the price. The contract says that the fruit was bought "at three cents per pound, f. o. b. (free on board cars at) Haywards." This, as we construe it, is an expression of intention that the price was to be paid or to become due when the fruit was delivered to the carrier at Haywards. But the result would be the same if the words quoted do not express such an intention, for if the time of payment be left indefinite the law implies that it is to be on the delivery of the goods. (C. C., Sec. 1784; Dyer vs. Daquid, 70, 111, 307; Case vs. Dewey, 55 Mich., 118.) In common phrase, the terms were cash on delivery; and where such is the case the delivery of the goods and the payment of the price are conditions concurrent. And if the condition of payment is not waived the title does not pass until the price is paid. (Peabody vs. Maguire, 79 Me., 585; Evansville R. R. vs. Erwin, 84 Ind.,

464-65; Turner vs. Moore, 58 Vt., 456; Adams vs. O'Connor, 100 Mass., 515; Hoffman vs. Culver, 7 Bradwell, 454.) It frequently happens that the seller will deliver the goods notwithstanding the failure to fulfill the condition of payment, and in such cases the question arises as to whether such delivery is not to be considered a waiver of the condition. Some courts hold that in the absence of circumstances showing a contrary intention the condition is waived and that the title passes. But where, as here, there was neither delivery nor payment, there can be no doubt but that the title does not pass. (Dixon vs. Duke, 85 Ind., 435-36.)

(b) There are other circumstances which constitute more specific criteria than the above. The goods were not in a condition in which the buyer could be called upon to accept them. Benjamin gives the following rule in this regard:

"Where by the agreement the vendor is to do anything to the goods for the purpose of putting them into that state into which the purchaser is to be bound to accept them, or, as it is sometimes worded, into a deliverable state, the performance of those things shall, in the absence of circumstances indicating a contrary intention, be taken to be a condition precedent to the vesting of the property." (Benjamin on Sales, Book 2, Ch. 3.)

In this case the seller was to give the necessary cultivation to the orchard, pick the fruit, pack it in suitable boxes or baskets, and deliver it to the carrier at Haywards.

(c) There is yet another circumstance. The portion of the crop to be delivered had not been identified. What was contracted for was to be "not less than 75 tons, and not exceeding 200 tons per annum." Possibly it might be argued that if any crop should turn out to be less than 75 tons, the buyer would not be bound to accept any portion of it. It is not necessary to consider that question. It certainly cannot be maintained that the same result would follow if the crop of any year should turn out to be more than 200 tons. At the time of the formation of the contract (to which the inquiry must relate) it could not be known what number of tons would be produced. Even if the fruit had been then ripe and hanging upon the trees it could not be known what portion was to go to the defendant until it was weighed.

In this regard Benjamin gives the following rule:

"Where anything remains to be done to the goods for the purpose of ascertaining the price, as by weighing, measuring, or testing the goods, where the price is to depend on the quantity or quality of the goods, the performance of these things also shall be a condition precedent to the transfer of the property, although the individual goods are ascertained, and they are in the state in which they ought to be accepted." (Benjamin on Sales, Book 2, Ch. 3.)

So far as concerns the proposition that where weighing or measuring is necessary to the identification of the goods, the title does not pass until they have been weighed or measured, the American cases are generally in accord with the above rule. (See Hires vs. Huff, 39 N. J. L., 10; Galloway vs. Weck, 54 Wis., 608; Commercial Bank vs. Gillette, 90 Ind., 268; Hutchinson vs. R. R. Co., 59 N. H., 489; Fry vs. Mobile Bank, 75 Ala., 474; Allen vs. Melton, 64 Tex., 218; Hubler vs. Gaston, 42 Am. Rep. 794; The Elgee Cotton Cases, 22 Wall., 180.)

In California the cases are to the same effect. (See Horr vs. Barker, 8 Cal., 608; McLoughlin vs. Piatti, 27 Cal., 463; Caruthers vs. McGarvey, 41 Cal., 15.) Some of the American cases are not in accord with the rule laid down by Mr. Benjamin in this; that if the goods are identified it does not matter that weighing or measuring is necessary to ascertain the price or the quantity. And this seems to be the law in California. For the Civil Code contains the following:

Sec. 1140. "The title to personal property, sold or exchanged, passes to the buyer whenever the parties agree upon a present transfer, and the thing itself is identified, whether it is separated from other things or not."

This action does not dispense with identification. On the contrary it requires it. It only dispenses with segregation when the property is otherwise identified. Therefore, where the identification consists in the segregation, weighing or measuring they are still necessary. And the present case was of the latter character.

As against these controlling features of the transaction, the plaintiff has only the language of the instrument. The term "sold," it is said, indicates a consummated sale. But this word is not conclusive. (Anderson vs. Read, 106 N. Y., 344-45.) In McLoughlin vs. Piatti (27 Cal., 458) the agreement was that in consideration of a certain sum, the receipt of which was recited, the owner "granted, bargained and sold" the property to the buyer, yet it was held to be a mere agreement to sell. And in the Elgee cotton cases (22 Wall., 180) the language was even stronger.

We think, therefore, that the title did not pass, and that consequently there was no sale, but a mere agreement to sell. Hence the case falls within Section 1768, and a warranty that the goods should be sound and merchantable was implied.

2. The court below found that the goods were not sound or merchantable at the place of production, etc. (Folios 93-95 and 98.) It is contended that this finding is not sustained by the evidence. But we think the evidence is amply sufficient.

S. Roper, who has been in the fruit business

for 12 or 14 years, and who was shown a sample, testified: "They are not really good for anything. They would not pay to dry. I suppose that animals would eat them." (Fol. 207.)

John A. Emerson, who had been in the fruit and produce business for 20 years, and who had seen a portion of the crop, and was shown a sample while on the stand, testified: "A very few boxes were very good apricots, but the majority of them were very small, very inferior, something that I could not sell unless at a very low figure. * * * I should not consider those in Exhibit H as merchantable. (Fol. 230-31.)

William Jacobs, who was in the fruit business, and who had seen a portion of the fruit, testified: "They were not even fit for pie-fruit. I would not consider them fit for pulp that we squeeze into jelly." (Fol. 240-41.)

"I say that those apricots that I saw of the crop of 1882 would not be salable to canners in this market or anybody else." (Fol. 244.)

And to the same effect was the testimony of other witnesses who were competent to give an opinion on the subject, and who had either seen portions of the crop or were shown samples of it. (See testimony of Prather, fol. 261; of Code, fol. 275-76; of Kimball, fol. 292; of Morse, fol. 299-300; of Cowing, fol. 317; and of Fowler, fol. 326.) The fact that most of the witnesses testified that the fruit might have been used for pie-fruit, or for pulp, does not help the plaintiff's case. Very inferior fruit may be used for pulp. And it was in evidence that: "There is only a small quantity used by canners for pulp. Fifty tons would be enough for the whole city" (fol. 241-2); and that "pie-fruit" is merely the inferior fruit which is found in most groves. It is not sold as such (fol. 269 to 272). Upon the same principle it might be contended that if the fruit could have been fed to hogs, it had a value, and was, therefore, not within the warranty.

Undoubtedly the testimony of some of the witnesses was toned down on cross examination, and some of them seem to have had an indirect interest in the question. But the question of credibility was, under our decisions, for the court below. At the very least, there was a substantial conflict in the evidence.

The fact that the orchard was properly cared for; that the trees were open to the inspection of the defendant, and that it was acquainted with the climatic conditions, etc., seem to us to be entirely irrelevant.

3. It seems to be contended, though not very strenuously, that the defendant accepted a portion of the crop, and that thereby it waived its rights in the premises. The facts in this regard are as follows:

When the first shipment reached the defendant it wrote to the plaintiff that the fruit was "by no means of proper quality, nor sound nor merchantable. Yet as these had been allowed to come to the city before we discovered their inferiority and unfitness and unmerchantable condition, and could not have been returned to you except at an entire loss to yourself, we made such disposition of them as we were able to make."

Subsequently the parties entered into a written contract whereby it was agreed that the defendant should send an agent to pick out such portions of the crop as was considered fit to be used. This contract provided that the receipt of the first shipment referred to in its letter above quoted, "shall not be regarded as an acceptance and shall not in any manner operate to waive any of the rights of said company;" and further, that the picking out and taking of such portion of the crop as should be picked out by the agent "shall not, nor shall any action hereunder be deemed or taken to be an acceptance by said company or a waiver, or to operate in any manner so as to affect, change or impair the rights, duties or obligations of either of the parties under said first-mentioned agreement." With reference to the remainder of the crop the contract contained the following:

"The remainder of said crop shall be forthwith picked, pitted and dried in the sun on said premises by said Blackwood on his own account and at his own cost and expense, subject to such rights or obligations with reference thereto as either party may have under said first-mentioned agreement."

The defendant sent its agent to the orchard, and he picked out all of the crop which was considered fit for use. This, together with the first shipment, amounted to 89,000 pounds, for which the defendant paid at the rate provided for by the first contract. The remainder was dried by the plaintiff as provided by the second agreement, and the suit is for the price of such remainder at the contract rate, less what the dried fruit was sold for.

We are unable to see that there was any waiver of defendant's rights under the first agreement. It was expressly agreed that the receipt and disposal of the first shipment should not be considered an acceptance. And had it not been for the second contract the defendant would doubtless not have taken any more of the apricots.

We, therefore, advise that the judgment and order denying a new trial be affirmed.

HAYNE, C.

We concur:

FOOTE, C.

BELCHER, C. C.

BY THE COURT.

For the reasons given in the foregoing opinion, the judgment and order denying a new trial are affirmed.

California's Population.

No State in the Union has increased in population for the last two years as fast as California. In 1880 the national census credited the State with a population of 864,694. In 1885 a State census was made by estimate, and this gave the population at 1,079,000. Since then the population has increased faster than in any two years of the past 10. During the last winter Surveyor-General Hammond saw the necessity of making as correct an estimate as possible of the number of the present population, that measures desired by Congress might be better urged. To that end examinations were made of all county registers, county books of statistics, and school census reports. From these and other sources a careful estimate was made, resulting in the conclusion that the present population of California was not less than 1,250,000. This shows an increase of 180,000 in two years. From present indications immigration hither will be larger this coming season than ever before. But the State is now just beginning to fill up. It can easily support many times its present population.

The following table presents some interesting comparisons:

State	Sq'r Miles.	Population '85.
Illinois	55,414	3,386,350
Indiana	33,809	2,000,000
Maryland	11,124	1,000,000
Massachusetts	7,800	1,941,465
New Jersey	7,320	1,278,033
Connecticut	4,750	672,300
New Hampshire	9,491	362,336
Rhode Island	1,052	304,284
Vermont	10,212	350,000

Total.....11,293,768

This table tells its own story. The area of Illinois, Indiana, Maryland, Massachusetts, New Jersey, Connecticut, New Hampshire, Rhode Island and Vermont is 14,619 square miles less than that of California, yet these States have an aggregate population of 11,293,768, while California has but a population of 1,250,000. Is it not safe to say that in a very few years at least 4,000,000 people will be residents of this State? And even then our population will not be so large as that of Pennsylvania, which has a territory of only 46,000 square miles. The possibilities of this State are simply marvelous. It has such an area of tillable land, its soil is so fertile, its farming industries are so varied, that it can maintain a larger number of agriculturists than any other State. But not only this. From its situation it will in time be an immense exporter of manufactured articles. Where now there are 10 mills there will be hundreds. The population will be centered in cities. The rumble and clatter of machinery will be familiar sounds in localities where they are now almost unheard.

These changes are bound to come and will come speedily. The tide of immigration has but just begun to set toward California. We are but the vanguard of the throngs that are coming.—*Hollister Free Lance.*

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Carriages.

We are receiving 10 carloads of Carriages, Buggies and Wagons from the Briggs Carriage Company of Amesbury, Mass., which will be sold at prices that will be satisfactory, considering style and workmanship. Quality of material guaranteed the best.

PALM VALLEY!

TROPICAL WONDERLAND!

EARLIEST FRUIT LAND IN THE WORLD.

EARLIEST VEGETABLE LAND IN THE WORLD.

FINEST WINTER CLIMATE IN THE WORLD.

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?

DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?

DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?

DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND COMPANY

Has secured 2000 acres of this choice land; has subdivided it into 5 and 10-acre lots, which they are now selling at \$200 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. Two hundred acres have now been sold on this basis, starting at \$150 per acre. The price is now \$200 per acre.

The Company has a Stone-walled Irrigating Canal, over ten miles in length, completed.

They have completed a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the town site owned by the Company.

They are planting 160 acres to an orange grove, of Navel oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State.

No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

THERE IS NO FROST, NO FOG, NO HARD WINDS.

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

BACK FILES of the PACIFIC RURAL PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

State Horticultural Society.

The State Horticultural Society held its regular meeting in this city May 25th, President Hilgard in the chair. W. M. Bramhall was proposed for membership.

Vice-President Hatch submitted a fruit-can label, which had been sent him from Colusa where it had been received from a party in Kansas. The label bore mark of a Cincinnati printing firm, and the name "Sacramento Valley Fruit Packing Co.," purporting to be located at Colusa. The fruit had been sold in Kansas, and as it was of an inferior quality, the California label had been used to facilitate its sale. As no such fruit-packing company exists in California, and, moreover, as Colusa has not among its industries a cannery, the label was stigmatized as a fraud. A resolution to that effect was unanimously adopted.

The Labor Question.

The labor supply for the fruit harvest was discussed at some length, and nearly all those present took part; but no facts except such as have already been mentioned in the RURAL were brought forward, except that there seemed to be indications that possibly considerable numbers of Japanese could be obtained in the future. The indications were general that the Chinamen understand the situation and propose to demand higher wages than heretofore.

Two fruit-cutting and pitting machines were shown. One the Lillie pitter and splitter, which has already been to some extent in use in this State and was highly commended by L. M. Moulton; the other, exhibited by D. N. Dilla, is a machine of which the manufacture is just beginning in this State, but which the inventor says has given satisfaction in Delaware. The latter machine is also to be fitted with an at-

THE LAMBORN ROAD MACHINE.

tachment for paring. These machines were examined with much interest and variously commented upon.

L. M. Moulton illustrated a canvas fruit-catcher, which he expected to use this season. It is to be suspended under the tree, and then the tree given a jar with a mallet sufficiently hard to bring down the ripe specimens upon the canvas, down the concave surface of which they will run to a basket properly placed. Mr. Moulton promised to report results attained with his device.

Fruit Prospects.

Notes were given by different parties concerning the fruit prospects. The general deductions were, that apricots will be but a partial crop, and growers will dry the fruit rather than sell it for less than 2½ cents per pound, and some are holding for 3 cents or more. The prune crop was reported only moderate and prices advancing. Peaches will be abundant and fine. The discussion of the labor supply and devices for labor-saving, will be continued at the meeting of June 29th.

THE TARIFF.—The tariff discussion continues at Washington, without definite result so far. We are glad to see that Congressmen Thompson and Biggs are standing out against the caucus of their party for the retention of the duty on fruit products of California, and will not vote for the Mills bill unless these changes are made. The votes of our two Congressmen appear to be so necessary that it is reported that their demands will be conceded to. This will be good as far as it goes.

GRAPE-GROWERS AND WINE MAKERS.—A publication which will be widely useful, is a "Directory of Grape Growers and Wine-Makers of California," which has just been prepared by Clarence J. Wetmore, Secretary of the Viticultural Commission, and issued as a public document. Its uses are obvious and we doubt not copies can be had from Mr. Wetmore at the offices of the Commission, 204 Montgomery street, S. F.

PORTLAND'S INDUSTRIAL FAIR.—The Industrial Fair Association at Portland, Oregon, has secured seven acres of land centrally situated, upon which the corner-stone of the Fair building is to be laid in about a fortnight. The stockholders have just voted to increase their capital stock from \$100,000 to \$150,000, and mean to have the pavilion and other buildings done in season for the fair next autumn.

Twisted-Wire Box Straps.

Our attention has been called to a recent invention for the strapping of boxes, whereby breakage of cases is prevented and packages are made proof against the rough handling received in transportation.

The ordinary straps heretofore in use have had their disadvantages. They either consumed too much time in applying them to the cases, or their great cost placed them hopelessly beyond the reach of shippers of the cheaper commodities. The inventor of this article has

The Twisted Box Strap and Its Method of Application.

utilized wire to accomplish a saving of money, time, and labor.

The wire is ingeniously twisted, as shown in the engraving, giving it great strength, and at intervals of four inches space is allowed for the

insertion of the nail, while in other straps the hole has to be previously drilled or punched.

This strap come in coils of from 4000 to 5500 feet, and is protected by a heavy coat of lacquer, so that it can be kept any length of time without rusting.

It is furnished in two weights. The lighter will hold with perfect safety packages of 150 pounds, while the heavier will securely hold cases of any size.

Shippers of the heavier fruits, vegetables and other produce may find a cheap and reliable article of this kind valuable in packing securely for long-distance shipments. We understand that A. I. Hall & Son, San Francisco, the Pacific Coast agents, will send samples and prices on application.

A Road Grader.

We give herewith an engraving of the Lamborn road machine, an Eastern machine which has been in use and is highly esteemed in many Eastern and Western States, as we learn by the circular furnished us by Truman, Hooker & Co. of San Francisco, who have the sale of the machine. The engraving shows sufficiently the general plan of the grader. Fuller information can be had by sending to Truman, Hooker & Co. for their illustrated circular, which gives the desirable points in the construction and operation and illustrations of its method of handling dirt. It is worthy the attention of those having road making, ditching or leveling to do.

OUR friend Joseph Sexton, not content with sending us the superb samples of double carnations mentioned in the PRESS of May 26th, dropped in upon us early this week with a handsome loquat branch, bearing 20 or more of the juicy yellow plums, and a ripe specimen of the cherimoyer, grown upon his grounds at Goleta. The photinia fruit and foliage hangs in the window of the State Board of Trade, but the custard-apple was referred bodily to the home board, which reports unanimously "delicious," with thanks to the donor.

TAHITI ORANGES.—J. Ivancovich & Co. of this city has been furnishing the Palermo Nursery and Citrus Association with several barrels of decayed Tahiti oranges, from the seeds of which it is hoped much good nursery stock will take its rise.

San Diego Flower Festival.

The flower festival given by San Diego ladies the second week in May for the benefit of the Woman's Home, added one more to the floral triumphs of the season. The display was made in a large rink, which was crowded days and evenings. There were a rose booth, a bulbous booth, cut flower booth, small flower booth, Mika booth, and National City, Coronado and Del Mar booths, besides those for refreshments. In a number of these the attendants wore bewitching fancy costumes.

In the Manager's booth a bed of delicate heliotrope, tinted with flowers plucked from Coronado Beach and bearing in letters of white blossoms the words "Southern Institute," was much admired.

The wildflower glen, with varied foliage and bright blossoms from the fields, arranged by Misses Hatch and Hornbeck of Mission Valley, was unique and beautiful.

One of the novelties in the amaryllis booth was a husk of seed from the date-palm, in appearance resembling an ear of corn without the silk, only somewhat flattened. The kernels are as distinct and the husks as abundant as they are in maize. The "sea onions," also, from Coronado Beach, attracted considerable notice.

In the exhibit from Sweetwater Valley nursery a full-rigged ship, composed of straws, dried grasses and everlasting flowers, which appeared to ride on billows of fern and maiden-hair, was praised highly.

Among the numerous floral designs, two anchors—one of evergreen and white roses, with the letters "Central W. C. T. U.," and the other (sent to the ladies of the bulbous booth by Mrs. H. Weston and Mrs. E. E. Haviland of Del Mar), consisting of geraniums, sweet peas and marguerites, with a floral cable of honeysuckles, marguerites and other flowers binding it to a ship of callas—were especially commended.

In the cut-flower booth was a spinning-wheel of red geraniums, marguerites, smilax and fuchsias.

Another fine piece of floral workmanship was a flower stand about seven feet high, containing 24 different varieties of roses, interwoven with cypress evergreens, the work of Miss M. A. Steel and Mrs. J. A. Rice of National City.

The exhibit of the San Diego nursery—embracing delicate ferns and flowers of common varieties, yet of the finest quality and exquisite tints—was unpretentious yet singularly elegant, and reflected credit on the taste and skill of its projector, Miss K. Sessions.

A large American flag, draped over the National City booth, was conceded to be the finest piece of all. It was the work of Mrs. J. C. Crenshaw. "With what seeming carelessness was it done—as though Freedom's emblem idly fluttered there in the throbs of some May morning's breeze. More than one thought 'How beautiful,' but when they examined and found it to be of red geraniums, white roses and purple sweet peas, they wondered."

The lettering on the wall back of this booth—"National City," in Mandarin oranges on a background of glossy green orange leaves—was very pretty.

We have named but a few of the designs, and cannot begin to give credit to the host of fair enthusiasts who, "for sweet charity's sake," gave time, and thought, and labor to the display and entertainments—which it is pleasant to learn, yielded a net return of over \$2000.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

A RICHLY carved cereal cabinet, valued at \$2000, which was to have been sent to the Melbourne Exposition, was destroyed in a fire last Monday evening at the West Coast Furniture Co.'s factory in this city.

CONVINCING GUARANTEES

Which are Justified by a World Experience.

TO THE PUBLIC:

Having branch houses and laboratories in seven different quarters, and therefore having a world-wide experience, we, H. H. Warner & Co., justify ourselves in making the following statements:

First.—For the past decade we have held that 93 per cent of diseases originate in the kidneys, which introduce uric acid into the system, a poison that is injurious to every organ, attacking and destroying first the organs which are the weakest. We have also held that if the kidneys are kept in perfect health most of the ordinary ailments will be prevented, or, if contracted, cured. Other practitioners have held that extreme kidney disease is incurable. We have proof of the contrary, however, in hundreds of thousands of cases in every section of the globe.

Second.—The kidneys being the sewers of the human system, it is impossible to keep the entire system in good working order unless these organs are doing their full duty. Most people do not believe their kidneys are out of order because they never give them any pain. It is a peculiarity of kidney disease that it may long exist without the knowledge of the patient or of the practitioner. It may be suspected if there is any gradual departure from ordinary health, which departure increases as age comes on.

Third.—We do not cure every known disease from one bottle. This is an impossibility.

Fourth.—Warner's Safe Remedies have been recognized by the doctors and the people all over the globe as standards of the highest excellence.

Fifth.—We make the following unqualified guarantees:

GUARANTEE 1.—That Warner's Safe Remedies are pure and harmless.

GUARANTEE 2.—That the testimonials used by us are genuine, and so far as we know, absolutely true. We will forfeit \$5000 for proof to the contrary.

GUARANTEE 3.—Warner's Safe Remedies have permanently cured many millions of people whom the doctors have pronounced incurable. Permanent cures are always convincing proofs of merit.

Sixth.—Ask your friends and neighbors what they think of Warner's Safe Cure.

REV. J. P. ARNOLD, Camden, Tenn., had fearful abscesses caused by kidney disease. In 1878 and 1881, other running abscesses appeared. He was fully cured in 1882 by Warner's Safe Cure, and in 1888 reported himself sound and well, and he is over 70 years old. MRS. ANNIE JENNESS MILLER, mistress of Dress, 253 Fifth avenue, New York, eight years ago was cured of nervous prostration, when the best New England physicians could do her no good. She cured herself with Warner's Safe Cure, and writes in 1887: "To-day I am a perfectly well woman. It is the only medicine I ever take."

L. B. PRICE, M. D., a gentleman and physician of the highest standing of Hanover C. H., Va., four years ago, after trying every other remedy for Bright's disease, including famous mineral waters, cured himself by Warner's Safe Cure, and March 24, 1888, wrote: "I have never had the slightest symptoms of my old and fearful trouble."

HERMAN URBAN, of MacNeale & Urban, safe makers, Cincinnati, Ohio, was broken down by excessive business cares. He was fully restored to health four years ago by Warner's Safe Cure and has since been in robust health.

DR. DIO LEWIS wrote: "If I found myself afflicted with a serious kidney disorder I would use Warner's Safe Cure."

MRS. E. J. WOLF, Gettysburg, Pa., S. C. Farrington, Gotha, Fla., J. M. Long, 43 East Second street, Cincinnati, Ohio, and the sister of J. W. Westlake, Mt. Vernon, Ohio, were cured of consumption (caused by kidney acid in the blood, as over half the cases are) by Warner's Safe Cure.

We could give many thousands of similar testimonials. Warner's Safe Cure does exactly as represented.

Seventh.—Warner's Safe Remedies were put on the market in obedience to a vow made by H. H. Warner that, if the remedy now known as Warner's safe cure, restored him to health he would spread its merits before the entire world. In ten years the demand has grown so that laboratories have been established in seven quarters of the globe. Warner's Safe Cure is a scientific specific—it cures when all the doctors fail, thousands of the best physicians prescribe it regularly, its power over disease is permanent and its reputation is of the most exalted character. Can you afford longer to ignore its extraordinary power? Now in the spring of the year, a few bottles will tone you up and cure all those ill feelings which, unknown to you, are caused by the fatal kidney poison in the blood, which will surely end fatally, if not at once removed. For this no other specific is known.

LAND PLASTER.—We have received an interesting pamphlet entitled "Mineral Manure," which gives the organization of the Pacific Gypsum and Fertilizer Co. of Stockton, Cal. This organization, with a capital of \$100,000, has secured gypsum mines in Nevada and proposes to supply a mineral which Prof. Hilgard's analysis shows contains over 99 per cent of pure gypsum or sulphate of lime. The officers of the company are L. U. Shippee, president; E. F. Smith, secretary and business manager; J. G. Scott, superintendent; other directors are W. B. Wright, H. O. Southworth and B. F. Langford. There is a good field for such a company.

INCUBATORS FOR AUSTRALIA.—The Petaluma Incubator Company, who lately shipped 10 of their machines to a firm in Sydney, Australia, now have an order from the same firm for 35 more, to be shipped as soon as possible. These incubators were little known in that country previous to last season, which witnessed the introduction of 37 of all sizes. This is simply a repetition of what is daily occurring in California; where a machine once finds its way into any locality, continued sales are certain, as they are undoubtedly superior to any others manufactured.

JAMES BETTNER of Riverside, well known for his active interest in horticulture and as a member of the State Board of Forestry, died on the 25th ult., aged 44, leaving a widow and two sons.

Breeders' Directory.

Six lines or less in this Directory at 50c per line per month.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE!

FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KERRIE—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. KERRIE, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully, E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 4 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

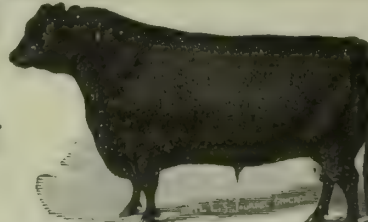

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, May 28, 1888.

Continued cool weather has been experienced the past week, doing much good to growing crops. In garden truck and fruits there is more activity, with receipts increasing. In cereals trading has been light as it usually is at the close of a season. Eastern and European wheat markets have fluctuated to some extent. To-day being decoration day all the exchanges are closed, so that the cable of Tuesday is the latest, which is as follows:

LIVERPOOL, May 29.—Spot wheat, easier. Nos. 1 and 2 wheat, Standard California, including Club wheat, highest price 75 cts, 6s 7d@6s 10d; Red American spring, 6s 9½d. Later—3:30 P. M.—poor demand.

LONDON, May 29.—Cargoes on passage and for shipment, inact. ve. Cargoes off coast, slow. California cargoes just shipped, 34s. Cargoes nearly due, 33s 6d. Cargoes off coast, 33s 6d@34s. Wheat and flour in Paris, rather easier. French country markets, mostly turn cheaper.

English Wheat Markets.

LONDON, May 25.—The receipts of wheat at Liverpool for the past three days amounts to 200,000 bu., only 30,000 being American. The weather is favorable for the wheat crop. The importations of wheat and flour in the United Kingdom during the past three months have been equivalent to 28,119,410 bu.; of wheat there were 16,757,184.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York:

Day	Cash	May	June	July	Aug.
Thursday	96½	96½	96½	96½	96½
Friday	96½	96½	96½	96½	96½
Saturday	96½	96½	96½	96½	96½
Sunday	96½	96½	96½	96½	96½
Monday	96½	96½	96½	96½	96½
Tuesday	96½	96½	96½	96½	96½

The closing prices for wheat have been as follows, at Chicago:

Day	Cash	May	June	July	Aug.
Thursday	96½	96½	96½	96½	96½
Friday	96½	96½	96½	96½	96½
Saturday	96½	96½	96½	96½	96½
Sunday	96½	96½	96½	96½	96½
Monday	96½	96½	96½	96½	96½
Tuesday	96½	96½	96½	96½	96½

California Products at Chicago.

CHICAGO, May 26.—There is only a moderate supply of California fruit held here and arrivals are small. California oranges are getting scarce. Choice Navel are already pretty well out of the market. Messinas are held firmly on account of an advance at the seaboard. The demand is moderate and the market is firm. Following are the prices received for fruit in good condition: California bright fruit, \$3.50 per box; smutty, \$3. Navel, bright, \$5.00 per box. The first apricots of the season to arrive from California sold fairly well at \$3.25 for 20-lb cases, and \$2.75 for boxes.

Trade for sweet cherries is limited, and those buying generally take California, which sell at \$2.25 for 10-lb boxes of choice Red and \$3 for fancy White.

Dried Fruit.—Raisins are at present quoted quite dull; the quality in many cases is quite ordinary to common, and this makes them slow. Plums and prunes sell slowly, but for apricots there continues a fair demand.

We quote: Apricots, sun-dried 1½ lb., 10½¢@11½¢; bleached, prime 13¢; do, choice, 14½¢@15¢; do, fancy, 15¢@16¢; evaporated, choice to fancy, 24½¢@26¢; peaches, sun-dried, 1½ lb., 11¢@12¢; do evaporated, unpeeled, 13¢@15¢; plums unpeeled, 10½¢@11¢; prunes, small, 1½ lb., 6¢@7¢; fancy large, 9¢@10¢.

Raisins, loose Muscatels, 2-crown, 1½ box, \$1.35@1.40; do, 3-crown, 1½ box, \$1.45@1.50; do, London Layers, 1½ box, \$2.25.

Wheat Output.

ST. PAUL, May 28.—Though the rains throughout the Northwest have lately been severe, culminating yesterday in a general downpour, advices indicate that the crops have not been in the least injured. Throughout the Red River valley, in Northern Dakota and Minnesota, the rains were needed. It is estimated that the wheat output in that region will be largely increased and will reach 50,000,000 bu. In some places seeding was delayed and everywhere corn is late in seeding, but not too late to injure the crop. Where wheat has appeared above the ground it was not injured at all by the recent storm, as it was not heavy enough to wash the young plants out, and not cold enough to do it damage. In Southern Dakota and Minnesota the outlook is excellent, and the warm rain was welcomed rather than regretted. No one feels any concern, and many state that the Northwestern crop promises better than at any time in five years.

A Corner in Grain.

VIENNA, May 25.—A ring of aristocratic land proprietors has created a corner in Austro-Hungarian maize. Some of them had to mortgage their estates in order to procure the necessary cash about 12,000,000 florins in all. The price of maize is rising rapidly, but the general opinion is that the scheme will prove a failure.

Wool.

NEW YORK, May 28.—The wool sales made are rather for a mere reduction of stock, but the market, as a whole, is sluggish. There is a notable lack of interest in the new clip. Primary sources report low trading, and mainly to local buyers. Philadelphia had a dropping market, with sales of 298,000 lbs. Boston sales foot up 1,965,600 lbs, including 305,000 lbs California spring, at 16¢@17¢; California fall, 10¢@14¢; 10,000 lbs Oregon, at 18¢@20¢; 50,000 lbs Territory, at 17¢@21¢; 20,000 lbs mixed scoured Texas, at 42¢; 5000 lbs fine do, at 47¢; 15,000 lbs spring Texas, at 15¢@17¢; 30,000 lbs do, at 14¢@18¢; 2,000 lbs fall Texas, at 15¢@17¢; 10,000 lbs No. 1 and quarter-blood, at 33½¢; 15,000 lbs fine delaine, at 33½¢; 30,000 lbs XX and above, 30¢; 10,000 lbs and above at 27½¢; 3000 lbs at 27½¢; 5000 lbs Michigan at 27¢; 30,000 lbs Ohio at 28¢; 6000 lbs Cape at 24¢. On private terms there were sold

174,000 lbs domestic, 20 Noils, 115 bags foreign and 350 bags Mediterranean. Liberal sales of Montevideo are reported for Antwerp.

Miscellaneous.

NEW YORK, May 28.—Hops are spiritless in the wholesale way. The small sales made to brewers show close buying. Pacific are quotable at from 34¢@35¢, State, 40¢@41¢, old, 40¢@41¢.

During the week some 9000 boxes of 2 and 3-crown Californian raisins were sold. They were somewhat off in grade, as the buyer offers to sell them in lots at \$1.40@1.50. The best marks are quoted as before.

The prices of California mustard seed are nominal at 3½¢@4¢.

Lima beans are firm.

Hides are fairly active in low grades, which are selling at from 11¢@14½¢. The strong feeling in prime qualities has not been upheld.

Apricots arrive steadily and are quoted at \$4.75 for a four-box case repacked at Chicago.

Cherries, \$3.50 per 10-pound box.

Local Markets.

The closing sales on the San Francisco Call Board were as follows:

Date	Buyer Season	Buyer Year
Thursday	\$1.35	\$1.50
Friday	1.35	1.50
Saturday	1.35	1.50
Sunday	1.35	1.50
Monday	1.35	1.50
Tuesday	1.35	1.50

BARLEY.—The market is softer. The pool by exaggerating the improvement in crops thought to send prices up. Calcuttas can be bought at from 7 to 7½¢, although the pool asks more.

BARLEY.—The market the past week was in buyers' favor, and as usual when weak trading was light. At the close yesterday there was a better feeling. On Call trading has been fair, generally at settling prices up to yesterday (Tuesday) when more buying orders came in. There is quite a short interest out.

BUTTER.—The market shows continued activity, but heavy receipts keep prices easy. Eastern advices report the market tending down, and also state that the feed is good and promises to remain so for a longer time than last year.

CHEESE.—The market is steady and firm, but no higher. At the East prices are falling.

EGGS.—The market has held steady throughout the week. Eastern receipts keep prices down.

FLOUR.—The market is strong, but no higher.

WHEAT.—The market the past week was dull and inactive, with buyers bidding down and only taking for immediate wants, but at the close yesterday values were firm and had an advancing tendency. In options trading has been good, but the bears succeeded in hammering the market to lower figures. There is said to be quite a line of shorts. As this is a holiday all exchanges are closed.

[COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco, from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 '86 to May 28, '87.	July 1, '87 to May 26, '88.
Flour, qr. sks.	3,949,966	3,341,531
Wheat, cts.	11,927,233	8,124,886
Barley, cts.	2,176,942	2,195,994
Oats, cts.	132,366	152,749
Potatoes, sks.	776,741	1,047,742
Corn, sks.	111,388	227,681
Rye, sks.	24,674	17,146
Buckwheat, sks.	5,805	3,054
Beans, sks.	429,333	387,363
Brans, sks.	420,809	469,916
Hay, tons.	97,025	109,740
Salt, tons.	21,658	16,010
Wool, bales.	78,513	68,505

Rye, cts.	5,289	5,289
Potatoes, sks.	144,834	82,365

Cereals.

From the New York *Producer Exchange Reporter* of May 21st, the following is obtained: The later crop advices from the Northwest prove quite unfavorable, and those from the Southwest are very disappointing. The continued heavy rains and disastrous floods have destroyed a vast area of under wheat, and in the North many farmers have been unable to get in their seed, and it is safe to estimate the shortage in the area under Spring wheat in Iowa, Dakota, Minnesota and Wisconsin on the 16th inst. at fully 16 per cent, but should the weather prove dry this week, a part of this deficiency will be made up. Much of the seed put into the ground during May has not come up, owing to the very cold and wet weather; much of the area seeded is under water, and with a temperature most of the time ranging between 20 and 35 degrees, the seed has not sprouted and in some localities it has rotted,

though this is a limited area. The slow growth of that seeded early is unfortunate, as with an early frost in August a portion of it would be cut off. The injury to the crop in Michigan and this State has cut short our supply of white wheat 8,000,000 bu., and we must look to the Pacific Coast to make good the loss here. The great deficiency in the last crop of winter wheat is now apparent to the most superficial observer; this is more noticeable west of Ohio and south of this parallel than elsewhere, and ere the close of June it will be still more noticeable. The breaking of the Sny levee on the Mississippi river has inundated a farming district that would have produced about 2,000,000 bushels of wheat but for this accident. The flood situations grew worse, and it is now almost certain that the Indian Grove district will be abandoned for years to come. People in the doomed region made a hurried, disorderly retreat for the bluffs, a pouring rain adding to the miseries of the homeless unfortunates. The entire region is completely covered with water. This district would have produced about 1,000,000 bu. of wheat and other crops of great value. It would be very difficult to estimate the great loss of crops by this appalling flood, so vast is the area covered. The visible supply is now reduced to about 29,800,000 bu., and outside of Minneapolis and Duluth there is less than 12,000,000 bu. of visible supply, and with a weekly consumption east of the Rocky mountains of 5,500,000 bu., this insignificant supply (12,000,000 bu.) will soon disappear, as most mills east and south of Lake Erie have no stocks of moment, beyond what they have purchased during the winter at Duluth, Detroit and Toledo, and the prospect now is, we shall hold a very insignificant visible supply on the 1st proximo; and ere new becomes plentiful it will be reduced to the smallest quantity held in many years, this largely due to shortage in the last crop of winter wheat.

The market the past week has ruled dull and inactive owing to buyers' selfishness and holders' firm attitude. The stock here and in interior warehouses is light. Nearly if not all the surplus held in the interior has been sent to tide water so as to take advantage of any upward movement based on short interests on Call. Millers continue to find much trouble in getting desirable grades except they pay quite an advance over current quotations. Receipts from Oregon are large, but still the market does not appear to be affected.

In barley the bears succeeded in hammering prices on Call down the past week, and in sympathy spot or cash parcels shaded off. The market did not break as low as was expected, still the decline in the main speculative option was quite marked, considering that the crop this year will be considerably less than that of 1887, the carryover will not be as large as was expected and the consumption is larger and steadily increasing.

Oats have ruled weak the past week, with buyers taking sparingly under the impression that a still lower range would obtain. Crop advices are without essential change.

White corn is lower. Yellow is steady. Crop prospects good. Eastern advices report a large increased acreage planted. The market at the East is strong.

Both rye and buckwheat met with sales this week. The prices obtained were lower than last quoted rates.

From an editorial in this week's *Herald of Trade* the following is obtained: "The acreage seeded to wheat on this coast the past season aggregated about five per cent more than in the season of 1886-87. Oregon and Washington were about 15 per cent less, while in this State it was about 10 per cent more. Taking our latest crop advices it is safe to state that the output of the coast will be 10 per cent less than in 1887, and may, with unfavorable weather, fall to fully 20 per cent below last year's output. The loss met by the drought this year is variously placed at from 40 to 50 per cent of the entire acreage seeded. Our returns do not warrant us in placing it at over 35 per cent, but in addition to this the quantity cut for hay is fully 10 per cent, making a total of not less than 45 per cent of the entire acreage seeded. With a full crop this State would have this year, all of 1,850,000 short tons; taking from this the loss through the lessened number of acres the quantity will be reduced to 1,040,000 short tons, provided the plant now standing gives the full average yield of a good season; but unfortunately our advices do not warrant such expectations, even if the State escapes the hot devastating north winds that are liable to come any day. Over 600 crop returns received the past week indicate that one-tenth of the plant now standing will go fully 20 per cent over an average; one-twentieth will go about 10 per cent above an average; one-quarter will be an average; one-twentieth will fall short 20 per cent and the remainder give about one-half of a crop. These returns state that had it not been for the cool, moist weather of the past three weeks the prospects would have been of the worst, but a change in the weather for the better brought about a decided improvement in the outlook and caused a corresponding increase in the general estimated outputs. Taking the 1,040,000 short tons as a basis for a full average yield of the acreage that will probably be harvested this season and adding the gain of 14,300 short tons over an average and then deducting the loss, 237,600 short tons, and the output, without further injury to the crop between now and harvest, will aggregate about 815,000 short tons, equivalent to 25,500,000 bushels. Deducting from this the food requirements of this State on the basis of 5 1/4 bushels per capita, and there will be left 85,000 short tons. From this must be deducted the average of the past two years' seed requirements, say about 5,000,000 bushels or about 165,000 tons, which will leave us an exportable surplus for the season of 1888-89, 425,000 short tons. If next season is favorable for plowing and outdoor work there will be an increase in the acreage seeded, which, of course, will cut into the exportable surplus.

The barley output in this State will be considerably short of last year, while the quantity of bright will be very much less in proportion than in 1887, owing to the foggy weather. The lessened acreage is due chiefly to the lowlands that were seeded last year to barley, owing to the late rains, having been seeded

to wheat this year, and these lowlands gave the largest yield to the acre. The acreage seeded the past season was about 15 per cent less than in 1886-87, while the acreage that was destroyed by unfavorable weather was much more in this year than last. Not only was there a lessened acreage and a larger number of fields of barley killed out by the dry weather, but there has been a large increase in the number of acres cut for hay. Of this it is very hard to obtain a correct estimate, but crop returns indicate that nearly 10 per cent of the entire acreage seeded was cut for hay against not quite five per cent last year. The crop of barley in Eastern Washington Territory and Eastern Oregon will be less than last year, but the quality will be better, owing to the late heavy rains damaging the grain in 1887."

Feedstuff.

The inquiry for bran and middlings is larger, due to a scarcity of pasture and the necessity of feeding more. Receipts are large which keep prices down. Ground barley is steadier at quotations. Feedmeal is firm.

New hay is coming in free, which is taken advantage of by buyers to bid down. Prices for both old and new are weak and lower. The consumption is growing.

Vegetables.

Garden is truck coming in quite freely, the weather being all that can be desired for the growing crops. Green corn is generally poor. Tomatoes come in sparingly. Peas and beans are in liberal receipts. Asparagus and rhubarb are in light supply, with a very wide range in prices for the farmer. Summer squash is in good supply and weak at quotations.

Potatoes are lower under free receipts, no increased demand. Poor are to work off, but large, well-matured are placed quite readily, although a slight shading in values is at times necessary to effect quick sales.

The receipts of onions are free, and as the demand is only fair, prices favor buyers.

In cabbage, cauliflowers, etc., there are no changes to report.

Fruits.

The buying of the J. Lusk Co. canning outfit by a San Francisco syndicate insures the running of the establishment and the taking of large supplies of raw fruit that would have to be disposed of otherwise. As the cannery will be controlled by San Francisco canners, competitive buying will, to a certain extent, be stopped, and it is only through competitive buying that good prices are realized by farmers.

For apricots, the writer is informed that 2½ to 3¢, f. o. b. on cars, is still paid by canners. There are very few canning varieties but are under contract.

For fruits, outside of cherries, it is difficult to hear of prices. Any subscriber or friend of this paper will confer a favor by writing to me prices paid for pears, plums, prunes, apples, peaches, etc., and address J. R. Farish, P. O. Box 2325, San Francisco, Cal.

Canners are paying from 3 to 6¢ for cherries, with occasional purchases of choice Royal Ann at 6½¢ and even 7¢. About all the canners are now running on cherries.

For currants canners pay from \$2.25 to \$2.75 per chest. The fruit as yet is not any too ripe for use. For gooseberries, from 1½ to 2¢ is the range paid. Blackberries were received the past week and sold at 25¢ per lb. The crop promises to be large.

In dried fruits there is no stock here to admit of business, consequently all prices are more or less nominal. The new crop will come on a bare and hungry market.

In raisins there is nothing doing, for the simple reason there is no stock here to do with.

Live-Stock.

The market is weak at lower prices for bullocks, and easier for mutton sheep. The consumption is not so large owing to more fruits and vegetables being consumed, while the growing scarcity of feed causes farmers to be more anxious to sell. In milk cows there is nothing doing, and to sell, low prices would have to be submitted to. In horses there is a good demand for single footers, bridge, driving and general utility horses, while for matched teams there are always ready buyers. Prices paid do not show any change. The demand is said to be slow.

Hogs have a steadier and firmer tone at 6½¢ for grain fed. Dairy fed fetch 6¼¢ to 6½¢. The offerings are only fair, barely enough for the block.

The market for dressed meat is quotable as follows by slaughterers to butchers (to get the price of stock on foot, take off one-third of the price for stall and grain fed and one-half from the price of grass fed, that is, animals running at large.)

HOGS.—On foot, grain fed, 6½¢ per lb.; dressed, 9¢@9½¢ per lb.; soft, 5½¢@6¢ per lb.; dressed, 8½¢@9½¢ per lb. Stock hogs, 4¢@5½¢ per lb.

BEEF.—Stall fed, 7½¢ per lb.; grass fed, extra, 7¢ per lb.; first quality, 7¢ per lb.; second quality 6¢@7¢ per lb.; third quality, 5¢@6¢ per lb.

LAMB.—Choice 8¢@9¢ per lb.; fair to good, 7¢@8¢.

MUTTON.—Wethers, 5½¢@6½¢ per lb.; ewes, 5¢@5½¢ per lb.; lamb, spring, 7¢@8¢ per lb.

Miscellaneous.

In poultry the market is kept easy and in buyers' favor by continued heavy receipts from points on the Missouri river.

Heavy shipments of wines are being made to the East. They aggregate larger than ever before at this season of the year. Some shipments of this season's canned cherries, strawberries and gooseberries are being made to the East. These will be followed by heavy shipments later on, or when canning becomes more general.

Hops are without change. The cool weather is against them. For futures it is said that 12½¢ has been paid for choice.

Wool continues slow. Receipts are being warehoused and held for higher prices, which are looked for before long. The wool manufacture buying combination continue to bid down, and when forced to pay good prices, which they are compelled to do, do so under the seal of secrecy. The wool market at Antwerp and also at London are not only higher, but advancing, while in this country the manufacture combination keeps prices down with the tariff bugbear or other equally as flimsy excuses.

The tonnage movement compares with last year at this date as follows:

	1888.	1887.
On the way	443,591	244,777
In port, disengaged	45,395	113,708
In port, engaged	12,769	20,593

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

AGRICULTURAL BOOKS.

Sold by Dewey & Co., Publishers "Pacific Rural Press."

CALIFORNIA FRUIT GROWER.—A practical Hand-book for the orchardist (in preparation).
CATALOGUE OF EUROPEAN VINES.—With synonyms and brief descriptions, by I. Bessdale, D. D. Invaluable to those growing the vine. Price, in pamphlet, 50 cents.
ORANGE GROWING IN CALIFORNIA.—By T. A. Garey, of Los Angeles. The most comprehensive treatise on the growth of this fruit. It contains full instructions for growing the trees, planting and care of orchards, etc.: 227 pages. Price, 75 cents.
SILK GROWERS' MANUAL.—By W. B. Ewer, A. M. A practical treatise full of useful hints for beginners in this State: 20 pages. Pamphlet, price 25 cents.
FRUIT GROWERS' CONVENTION REPORTS.—These annual conventions have resulted in bringing out the best and most useful information concerning the growth of different fruits in this State. The subjects discussed are of the most direct practical value and the facts laid down will prove helpful and suggestive to all in the fruit business. We have the reports of 1881, 1882, 1884, and 1885—the first for 10 cents, the others at 25 cents each.
THE AGRICULTURAL FEATURES OF CALIFORNIA.—By Prof. Hilgard, 138 large pages, bound in stiff cloth, with colored maps, \$1. This book is the best general review of California soils, climate and productions in existence.
NILES' STOCK AND POULTRY BOOK.—Pamphlet, giving directions applicable to poultry growing in this State: 120 pages, post-paid for 50 cents.
KENDALL'S TREATISE ON THE HORSE AND DISEASES.—Post-paid for 25 cents.

ORANGE CULTURE IN CALIFORNIA.

A Timely Treatise.

Now that the interest in the culture of the orange is extending so as to embrace nearly all parts of the State, a book giving the results of experience in parts of the State where the growth of the fruit has been longest pursued will be found of wide usefulness.

"Orange Culture in California" was written by Thos. A. Garey of Los Angeles, after many years of practical experience and observation in the growth of the fruit. It is a well-printed hand-book of 196 pages, and treats of nursery practice, planting of orange orchards, cultivation and irrigation, pruning, estimates of cost of plantations, best varieties, etc.

The book is sent post-paid at the reduced price of 75 cents per copy, in cloth binding. Address Dewey & Co., Publishers "Pacific Rural Press," 220 Market St., S. F.

SPLINT BASKETS.—D. J. Johnson and C. W. Weston have formed the Pacific Splint Basket Co., with a large plant for the purpose of manufacturing splint baskets for various uses. The material is spruce, and they propose to produce whatever our fruit packers desire. Large quantities of these goods will be called for, and it is to the growers' interest to have the manufacture pushed to the ultimate of good work and cheap packages.

IRRIGATION ELECTION ORDERED IN COLUSA.—The Supervisors of Colusa county have made an order defining and establishing the boundaries of a proposed irrigation district in Colusa and Yolo, to be called the "College Irrigation District," and publish notice of an election, to be held Monday, June 18th, for the purpose of determining whether or not the same shall be organized under the provisions of the Wright enactment.

WM. R. CLAYPOOL of Sacramento, a noted trainer of horses, died this week.

A Treatise on the Horse and his Diseases

By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7x5 inches. Price, only 25 cents, or five for \$1, on receipt of which we will send by mail to any address.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

THE ASPINWALL POTATO PLANTER.**SPECIAL ADVANTAGES:**

The planting can be done from 3 to 9 inches in depth and the covering is uniform.

From 5 to 8 acres per day can be planted and THE ENTIRE WORK of marking, furrowing, dropping and covering is done in a single operation.

Please note the fact that dry or top earth is not drawn over the seed by the covers of our Planter, but, on the contrary, the moist or UNDER

earth is drawn upon the seed, a feature that every experienced potato grower will appreciate, as nothing is more fatal than to cover cut seed in a dry time with dry earth.

The work is far superior to hand planting. The rows are straight, and, the furrows being V-shaped, the seed must necessarily be deposited in a perfect line; this enables CLOSE and EARLY cultivation.

THE COST of raising potatoes becomes greatly reduced by the use of our Planter, and to a potato grower who raises much of an area the machine will pay for itself in a single season.

The Planter is capable of being adjusted to plant either cut or whole seed 10, 13, 15, 17, 21 and 26 inches apart; also, different depths, and shallow or deep covering can be practiced, as desired.

The distance of planting is exactly the same in each row.

The Planter is well made and very durable, and with proper care will last many years.

There is no great strain on any of its parts, being entirely free from any cog gear and fast motion. The speed of the mechanism of the Planter is no faster than the movement of the ground wheel.

We give an absolute guarantee that our Planter will do all we claim for it.

No farming tool has ever done more accurate and rapid work, and we strongly question whether any implement (character of work and quantity being taken into consideration) has proven itself to be of such financial advantage to the farmer. We make strong claims for our Potato Planter, knowing that we can fulfill every one of

Prepare to Dry.

Parties who have made haste to assure fruit-growers that the syndicate which purchased the wreck of the J. Lusk cannery proposed to continue the concern and to serve the growers a good turn by so doing must have mistaken their wish for the intention of the parties. It is quite likely that one of the parties in the combination may have had such a plan in mind, but the fact is now fully disclosed that with the majority the object was for speculation and not for continuance, and that their intention was the dismemberment of the concern. So far as the growers are concerned, it would have been vastly better if the syndicate had been beaten and the successors of the old company who would have continued the factory had secured possession of the property. It does not argue well for the future of the growing interest to have so large a concern thrown down, and, though it may be legitimate enough, it is hardly public spirited to speculate so as to bring about such results. It looks now as though such of the fruit contracts as one or more of the city canneries can make money on will be purchased of the assignees, and the other contracts will go among the liabilities of the bankrupt concern, or rather that the growers will have to resell their fruit as best they can.

This season's experience serves to reinforce a position which has long been taken by our most progressive growers and which we have frequently approved, to wit, that the only safeguard which the grower can throw about his product is to prepare to manufacture it himself whenever buyers will not pay what it is fairly worth. Every fruit-grower should have an evaporator or full appliances for sun-drying if his local climate favors this method, and just as soon as the market rate falls too low stop the sale at once. It may be that fire will never be lighted in the evaporator or the trays never see the sunlight, still his investment in such accessories will yield him larger interest than any other property on his place.

Another movement which should be general is the establishment of fruit-growers' companies in every fruit district like that started this season in Vacaville, or like others which have existed longer at Newcastle or elsewhere. Such companies are more powerful than individuals and wiser than individuals, and they are competent to enlist capital in canneries or drying establishments, or to plan undertakings to place the fruit in distant markets. Such combinations will place growers on equal footings with commercial canners, or driers, or packers,

and things will be apt to go forward on correct business principles between all interested, either in production or trade. The experience of some of the smaller canneries has been eminently satisfactory, and their numbers should be multiplied. When an old, capacious, and popular concern can be unceremoniously snuffed out as the J. Lusk Co. has been, it is about time for the growers to protect themselves in some way.

IRRIGATING WITH CURRENT WHEELS.—These devices for lifting water a moderate distance

CALIFORNIA AT COLUMBUS.—The National Encampment of the G. A. R. meets at Columbus, Ohio, the second week of September. A joint committee of the Department of California, G. A. R., and the State Board of Trade has mailed to every Board of Trade, Improvement and Development Association, Board of Supervisors, Grange and Grand Army Post in the State, a circular asking the co-operation of the people in collecting, arranging and placing on exhibition at Columbus, a display of the products of California that will be an instructive

Scene in the Peach Orchard.

We give herewith a scene in the peach orchard of A. T. Hatch of Suisun, which well illustrates the general form of a well-trained low-headed peach tree, which is found best adapted to California conditions. Though it is possible to find in plantations made 25 years ago or more trees with long bare stems, their numbers are generally few, because the most of their early companions have fallen a prey to sun burn. Low heading was advocated in the earliest days

of California fruit-growing, and practiced to a certain extent, but it took a good many years of experience to make the practice prevalent as it is at present.

This little glimpse at Mr. Hatch's trees, though it covers but an exceedingly small fraction of the 800 acres which he now has planted with fruit trees on his home place, gives a little clue to his practice. Aside from the shapeliness of the trees, the observer will notice the generous distance between them, which is another lesson from years of experience. The older plantations are generally crowded, the trees from their proximity of 12 or 16 feet have interlaced their branches and crowded each other almost to suffocation. The later experience, pointing to 24 or 26 feet as near enough, gives us better trees and trees which will yield more from the same ground than the thickly set will produce. Another lesson to learn from the little sketch is the beauty of clean culture. Over Mr. Hatch's 800 acres it is almost impossible to find a weed or even a clod. He has a most delightful soil to work on most of his orchard, and

SCENE IN THE PEACH ORCHARD OF A. T. HATCH, SUISUN VALLEY.

from running streams seem to be giving satisfactory results in Utah and very large wheels are used. A correspondent of the Salt Lake Tribune describes wheels in use on Green river by the Farrers who are pioneer farmers. They put in some current-wheels about four or six years ago, and these proved successful. They now have five at work. The last one just started is 20 feet in diameter. It is built like a steamboat paddle wheel, so arranged as to be moved by the current striking the paddles. On the wheel are 20 buckets, each holding 16 gallons of water. These are filled when down and emptied when up. As the wheel makes three revolutions per minute, it is over 800 gallons discharged per minute, enough, it is claimed, to irrigate 100 acres of land. This wheel cost \$650 to build to make the short race by throwing out a wing dam into the river, and to put in a little fluming to reach the ditch. C. J. Millis, another farmer, has three wheels in operation.

object-lesson to their Eastern Comrades and the thousands of visitors attending the Encampment. Articles should be forwarded seasonably, care of the California State Board of Trade, 16 and 18 Second St., S. F., where transportation charges will be attended to without expense to the contributor.

WEED CUTTER FOR VINEYARDS.—Vine-growers in the Livermore valley, the *Herald* says, are introducing a weed-cutter which saves a great deal of labor, and does very effectual work. The cutter is a steel knife which passes along between the rows two or three inches below the surface of the ground and cuts out the weeds. This knife is usually bolted to a piece of scantling, on a bevel of 45 degrees. It may then be attached to the rear of a cultivator or clodmasher, or set in a light frame-work. It is a cheap and valuable tool, and some of the growers buy a piece of steel and make it themselves.

he shows his appreciation of its excellence by working it almost continuously. The result is the smooth surface which the photograph exhibits. The actual value of such cultivation has recently been emphasized in the letters from Gen. N. P. Chipman and others which we have published in the *RURAL*.

The fall of the shadows shows that the picture is taken about noontime. Any one who has been in our California orchards can appreciate the suggestions which the picture makes of the quiet air and full heat which minister to the fruit-ripening process.

ARSENIC FOR GOPHERS.—Joseph Wright informs the Livermore *Herald* how he has succeeded in killing off gophers. He merely cuts up a lot of small potatoes, rubs on a little arsenic and throws the pieces in the runs. He lost a great many vines before trying this plan, but since, there are no gophers and his vines are safe.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Observations in Italy.

EDITORS PRESS:—A letter of introduction to the professor of horticulture at Caserta (a town near Naples) was handed me by a friend of Cavalier Mertiera of Naples. Upon arrival at that place, I drove out to the experimental grounds and horticultural school and handed my letter to the professor. I was received very cordially and the professor showed me through the grounds.

Observing that a row of peach trees were trained to grow flat against the walled inclosure of the grounds, I asked him the following question: Will peaches grow here in Tuscany without training against a wall?

Yes, they will grow all right enough, but they will not ripen; or, worse yet, the early spring frosts to which we are subject may destroy them. We want as much sun and protection as we can obtain, hence we train our peach trees against the walls, as you see, and provide the mat covers you see above (pointing to them), to cover them in times of necessity. No, peaches cannot be grown here in Tuscany profitably, but they can in Southern Italy.

What injurious insects infest the peach trees here?

Two species of aphids.

What remedy do you use?

Tobacco water with spray pump; also soap and water with petroleum.

Have you any codlin moths?

Yes, plenty. We stir the ground often and destroy infected fruit. We have no absolute remedy.

We graft our dwarf pears on the *Cydonia vulgaris* and Standards on the *Cyrus Communis* because we have found them to be thrifty growers.

I have observed that they grow dwarf pears on the following plan: A wire is stretched about 12 to 15 inches from the ground in a horizontal line. The trees are about eight feet apart, and the trunk, when about 10 inches from the ground, is bent in a most direct right angle and tied to the wire.

In answer to questions I was told that the bending was done for the purpose of withholding a too rapid flow of sap (which would tend to produce wood); by withholding the rapid flow of sap the growth of the tree is diminished, but the production of fruit is largely increased. This was certainly correct, for the trees that I saw treated in that way had their branches literally covered with young pears. Might it not be a good idea to try this plan in California?

The advantages in addition to large yield that may be mentioned are these: The ground is economized; pruning and harvesting can be done much cheaper.

In going to the vineyard I observed that he had some varieties of grapes trained high, and others of the same variety were grown low; this led me to inquire which gives the greater result, high or low pruning? I was told that it depends on the variety. Generally speaking, high pruning gives the greater number of bunches with the same number of eyes. I was told that high pruning is least subject to early spring frosts.

During my stay here I have tried to find out the mode of preserving the winter pears which may still be seen on the tables of the hotels and in the market. At the market in Venice I found just what I wanted.

Baskets of apples and pears were exposed for sale, and I saw that each layer and between each apple or pear there was a layer of thin strips of paper. These slips were about as heavy as our fruit-wrapping paper, and it appeared to me that this mode of packing possesses the following advantages over our mode:

1st. It can be done much quicker and requires less expertness in the packer. It is cheaper, and it protects the fruit much better, as it prevents contact.

Mr. J. A. Woodson of the Sacramento Record Union suggested to me that paper pellets or small pieces would be preferable to wrapping, but after seeing the paper strips I think them preferable, and if I reach home in time for harvesting I will be inclined to give this mode a trial.

I should like to see some one try it this season. To-morrow I leave for Vienna, and expect to inform you what observations I may make in Austria.

Udina, Italy, May 5th.

DAVID LUBIN.

Farmers' Institutes.

EDITORS PRESS:—Since agriculture gives employment to so many persons, and all other industries depend upon agriculture, is it not a good plan to aid those, who are thus engaged, in every possible way? And as a means of aiding, what can be better than institutes? We know that the thorough, live educators believe in them, and the result of educational institutes have been highly beneficial and have become a fixture in this country. As a class, farmers do not have vacations. Their work requires constant care and attention, and undoubtedly institutes for their benefit would prove valuable to them in more ways than one, and if valuable to them, then of necessity of value to all classes.

In a number of the Northwestern States, notably Wisconsin, Iowa, Minnesota, Illinois and Ohio, farmers' institutes are held every winter, and so popular have they become, that there is a general cry for more. Wisconsin annually appropriates \$5000 to pay the expenses of these meetings; has a superintendent who arranges the time and place and provides speakers for them. The plan is somewhat like this: During the summer months the superintendent ascertains what counties in the State would like to have institutes, and then plans accordingly. For instance, a county in which dairy farming is general has an institute in which matters pertaining to the feeding, care of cows, the handling of milk, making butter and cheese, are discussed, the meeting lasting two or three days; then a county where beef cattle is the product is treated in the same way; the tobacco section is not overlooked, and, in fact, every interest has its opportunity, and I have never known of any to fail to embrace it. I have for several years attended and taken part in these institutes, and have watched the increasing interest year after year, and know that the farmers appreciate the efforts put forth to aid them, and willingly do they pay their share of the tax required to carry them on. In arranging for institutes, each county furnishes a hall in which to hold the meetings; furnishes from its citizens a number who will speak on the branch of agriculture they are engaged in, while the superintendent provides other speakers. It was my fortune to frequently speak on dairy farming, and I have seen the result of these meetings to be better cows, a larger yield of milk and butter and better homes for the farmer, and all because "the know how" was learned at these institutes.

In California, with the thousands of newcomers who are strangers to the soil and climate, these institutes would prove of incalculable benefit, and could be arranged for by the counties which might desire them, without any State aid. The State University might take charge of them and aid in the matter. None of us are too old to learn, and an institute conducted by practical dairymen, cattle and sheep-growers and orchardists would prove to be a good and profitable school for all who are engaged in agricultural pursuits. Let it be tried and it will grow in popularity.

San Jose, May 28th. R. P. MCGILVER.

POULTRY YARD.

Suggestions for the Season.

Make no compromise with lice or filth. Alfalfa is the best dry weather plant for supplying green food.

Market the culls as soon as they are old enough to show defects that make them unfit for breeding stock.

Bring the broilers forward as rapidly as possible. The profit lies in producing a plump broiler in a short space of time.

The experience of practical breeders as set forth in their letters which we publish monthly, are reliable points to guide the beginner. Theories are generally quite unreliable, and often cause disappointment.

An insect powder made by stirring a quarter ounce of carbolic acid in one pound of sulphur is as effective as any in the market, and very much cheaper.

By sifting ordinary wood ashes when taken from the stove, a good lot of charcoal and burnt bone can be obtained, which is relished by the fowls and is of much benefit to them.

Broody hens should be well fed and have the best attention in a quiet yard or coop, if it is desired to relieve them of their broodiness and get them to laying again, for the reason that egg production is very exhaustive to the system.

Setting hens that come off with their brood in good condition, often go to laying again before the chicks are old enough to care for themselves, if generally fed on nutritious and egg-producing food. This may be avoided by confining the hen in a coops and feeding the chicks outside. June is one of the most important months of the year in the management of the poultry-yard. The first of June is a set bayon which it is next to useless to set eggs for hatching under ordinary conditions, as the chicks hatched will be weakly and hardly worth the trouble of raising.

A general cleanup of yards, nests, roasts, etc., should now be instituted. The nest-boxes should be cleaned out and oiled, or sprinkled with a solution of carbolic acid to destroy all lice; and any hens found lingering about the nests at night should be relieved of their broodiness, that they may yet lay a number of eggs before moulting.

Plenty of shade, a supply of green food, a good dust bath, and a constant supply of pure water are essentials during the hot months. Move the water fountains to the coolest part of the yard, and regularly clean and fill each day.

Special attention should be given the chicks, particularly the later hatched ones. If raised with hens, the first appearance of lice should be followed with a dusting of both hen and chicks with some good insect powder. A grassy run or a green range under trees contributes much to the health and growth of chicks.

This is a good time of the year to dispose of all stock not wanted either for breeding or egg production next season, as they will soon begin to moult and become unsaleable; besides many

fowls succumb to the drain on the system caused by the change of plumage.

As the breeding season is now over, it is a good plan to separate the sexes, if convenient to do so during the warm months, as the change is likely to prove beneficial. The eggs laid will of course be infertile, but will keep better, and may be sold anywhere in the market without fear of some enterprising neighbor getting a start of your stock at market prices.—*The California Cuckler.*

THE APIARY.

The California Honey Product and Trade.

As the honey season of 1887 is virtually at an end, and the season of 1888 is just opening, several consignments of new honey having been already received, the statistics of last crop can now be given with as much accuracy as at any subsequent date. To afford comparison, we append receipts of California honey at San Francisco, and shipments from this State by land and sea for a series of years. The number of cases received in San Francisco for past seven years were by months as follows:

	1881.	1882.	1883.	1884.	1885.	1886.	1887.
Jan.	1,758	1,774	665	88	5,095	1,421	751
Feb.	980	95	394	167	1,694	1,120	395
Mar.	334	420	34	144	2,375	1,032	1,285
Apr.	771	654	290	250	1,195	145	467
May	121	215	287	254	889	714	1,763
June	292	669	631	690	892	4,517	1,284
July	692	1,033	948	2,047	925	228	819
Aug.	835	2,003	2,101	4,069	1,185	2,252	1,065
Sept.	1,428	3,392	5,177	6,877	1,400	3,488	1,000
Oct.	1,681	2,700	2,446	10,708	2,518	5,203	893
Nov.	998	1,008	1,253	5,140	2,298	2,938	1,045
Dec.	901	1,183	1,679	4,381	2,957	2,206	1,501

10,658 14,489 16,804 34,263 33,372 25,315 13,200

The above shows arrivals for the past year to have been little over half the quantity received in 1886 and less than in any previous year since 1881, being 600 cases less than were received in the light arrivals of 1883. Receipts from January 1, 1888, to date, aggregate 1150 cases, including about 400 cases of this year's crop. Arrivals since June 1, 1887, aggregate 9500 cases, and there is presumably very little or no old honey now remaining in the interior. Receipts for the previous season, from June to June, were 21,260 cases; for season of 1885-86, 16,000 cases; season 1884-85, 44,000 cases; showing a wide difference for the past four seasons, but the quantities are in keeping with the amount produced.

Exports for the past seven years have been as follows:

By sea from San Francisco.		By rail from S. F. and interior.	
	Cases	Lbs.	Lbs.
1881.....	8,849	62,700	378,370
1882.....	3,612	527,680
1883.....	6,963	269,400
1884.....	13,094	157,320	2,352,000
1885.....	12,151	32,550	1,313,260
1886.....	7,214	1,800	2,676,910
1887.....	2,922	1,155,720

Of last year's shipments eastward by rail, 547,910 pounds were sent from San Francisco and 607,810 pounds from interior. For the previous year shipments by rail were 1,217,530 pounds from this city, and 1,459,380 pounds from interior. Exports for 1888 to date by sea: Three hundred and forty cases from San Francisco; by rail, 8550 pounds from San Francisco, and 21,570 pounds from interior, none having gone outward by rail, according to official reports, since January last. Allowing about one third of the receipts here to have been comb honey, we have the following showing in pounds for the past crop, calculating from June 1, 1887:

	Lbs.
Extracted 6400 cases.....	768,000
Combed 2100 cases.....	1,050,000
Shipped by rail from interior.....	422,450
Total.....	1,376,450

Aggregating only 688 tons, while for previous season the receipts added to shipments from interior footed up 1800 tons. The entire product of this State last season, it is estimated, did not exceed much if any more than 700 tons, considerable honey being carried over from a previous season. As closely as can be estimated, the entire yield of previous years was 2500 tons in 1886, 700 tons in 1885, and 4500 tons in 1884, the largest quantity ever produced. Of the shipments by sea the past year, 1000 cases went to France, 725 to England, 500 to Germany, but this honey was all forwarded out of the crop of 1886. Less than 700 cases have been shipped by water since last June, Australia taking a larger portion of the minor shipments than any other country, the balance going mainly to China, Hawaiian Islands and British Columbia. There has been no demand for Europe the past season, and no inducement to forward there, some of the 1886 crop being still on the market in European centers. The quality as well as the quantity of the 1887 yield was below the average, the percentage of extra white honey the past season having been unusually small. While the quality was below usual standard, prices ruled much higher than for previous crop, a large portion of which was high grade. In 1886 prices for extracted were mainly 4@5c, some of excellent quality changing hands at inside figure, and for fair to choice comb the range was 10@14c.

The past season extracted commanded from

first hands 5@8c, not much, however, selling over 7c, but this was largely on account of there being very little which was water white. Range of prices on comb for 1887 yield was 12 @18c for fair to fancy. Growers have been finding fault at the figures realized for last crop, but they have really reason to congratulate themselves on faring so well. Much of the 1887 honey passed from second hands at an actual loss, and some is now offering for less than was paid the producers. There is no likelihood of such prices being realized this season as prevailed for last crop. It is doubtful, in fact, if as good figures rule throughout the season as were current in 1886. There are no wholesale buyers who at this early date would name over 5½c for choicest extracted, and for amber extracted it would be difficult at present to secure 4c for large quantities. The 1888 crop promises to be large, at least as compared with last year, and it is believed the quality will be in the main good. Receipts of new thus far have been mainly from Santa Barbara county, where some superior honey is produced, but owing to the cultivation of mustard there, the blossom of which does not impart desirable color or the most palatable flavor, the quality is not in the main so fine as from the coast counties farther south. San Diego, Los Angeles, San Bernardino and Ventura counties are large producers, and where the white sage is found the choicest honey is obtained, no other blossom having been yet discovered which furnishes its superior for the business of the apiarist.—*Grocer and Country Merchant.*

THE IRRIGATOR.

The Wright Law Constitutional.

There is great satisfaction in districts contemplating irrigation enterprises over the following decision of the Supreme Court of California, affirming the constitutionality of the Wright Irrigation law passed by the last session of the Legislature. There are in this State 11 irrigation districts organized and millions of capital invested, all waiting for this decision, which establishes the constitutionality of the above mentioned Act. In Stanislaus county alone there are two irrigation districts and \$1,500,000 invested. The following is a full text of the decision:

Turlock Irrigation District against Williams. This is an application for a writ of mandate to compel the defendant as the secretary of an irrigation district (under the "Act to Provide for the Organization and Government of Irrigation Districts," approved March 7, 1887) to sign certain bonds which the applicant proposes to issue under Section 15 of that Act. The refusal of the defendant to sign those instruments is based upon the ground that the statute is unconstitutional and void. One of the distinguished counsel for the defendant contends that the districts contemplated by the Act are private corporations formed for a private purpose; to use his own language: "Such an organization has none of the elements of a public municipal body."

While another able attorney on the same side contends that "all the constituents of a public corporation are present, and to that class of corporations a district of the statute must be assigned," and claims that the money sought to be raised under the Act is a general tax, and that the system of organization of the corporations prescribed in the Act is in conflict with the general plan of constitutional political organization; and that the mode of taxation provided is different from that made necessary by the Constitution for general governmental purposes; and, therefore, the Act is void.

We are inclined to agree with the last-mentioned advocate of the defendant's cause, but to the extent only that the districts, when organized as provided in the Act under discussion, have all the elements of corporations formed to accomplish a public use and purpose, according to the rules of law laid down in *Hagar vs. Supervisors of Yolo county*. The results to be derived from a drainage law, and one which has for its purpose the irrigation of immense bodies of arid lands must necessarily be the same, as respects the public good. The one is intended to bring into cultivation and make productive a large acreage of land which would otherwise remain uncultivated and unproductive of any advantage to the State, being useless, incapable of yielding any revenue of importance toward the support of the general purposes of State Government by reason of too much water flowing over, or standing upon, or percolating through it. The other has for its main object the utilizing and improvement of vast tracts of arid and unfruitful soil, desert-like in character, much of which, if water in sufficient quantities could be conducted upon, and applied to it, may be made to produce the same results as flow from the drainage of large bodies of swamp and overflowed lands. Such a general scheme, by which immigration may be stimulated, the taxable property increased, the relative burdens of taxation upon the whole people decreased, and the comfort and advantage of many thriving communities subverted, would seem to redound to the common advantage of all the people of the State to a greater or less extent. It is true that incidentally private persons and private property may be benefited, but the

main plan of the Legislature, viz., the general welfare of the whole people, inseparably bound up with the interests of those living in sections which are dry and unproductive without irrigation, is plain to be seen pervading the whole of the Act in question. This is not a law passed to accomplish exclusive and selfish private gain; it is an extensive and far-reaching plan by which the general public may be vastly benefited. And the Legislature acted with good judgment in enacting it. If the use for which property is taken be to satisfy a great public want or public exigency, it is a public use within the meaning of the Constitution, and the State is not limited to any given mode of applying that property to satisfy the want or meet the exigency. For the most part the term "public purposes" is employed in the same sense in the law of taxation and in the law of eminent domain. So that a law which is for a public purpose, and which mainly concerns the public welfare, which lays an assessment upon property according to approximate equality of benefits is not unconstitutional because of that feature.

Perhaps to a greater extent than any of the other States, California, speaking through the Acts of her Legislature, her court of last resort and constitution, seems to have considered the irrigation of lands and the supplying of mines with water as of great public concern, and in no sense can it be said that under the Act in question the assessment to pay the bonds is to be levied or collected in order that one man may take another's property for his own exclusive use. Therefore it is evident that the districts in question, as organized under the Act, are not private corporations, organized exclusively for the purposes of private gain. They are at least quasi public corporations, in the sense that the purpose for which they are to be organized is for the general public benefit. Nor does it follow that this method of assessments and their collection adopted must be assimilated to and follow exactly the mode provided in the Constitution for the assessment and collection of taxes for general State purposes. The nature of the assessment is one of local improvements, which, however, eventuate in the advancement of the public good, and such assessments and collections can be lawfully made.

It is clear that those clauses of the Constitution which provide that taxation shall be equal and uniform, and which prescribe the mode of assessment and the persons by whom it shall be made, and that all property shall be taxed, have no application to assessments levied for local improvements. And as was said of the Drainage Act, so it may be said of the one in hand relative to irrigation, that a system which has for its object the reclaiming from the desert of vast bodies of land, "may justly be regarded as a public improvement of great magnitude and of the utmost importance to the community." It has been planned by the Legislature on the basis of "dividing the territory to be reclaimed into districts, and assessing the cost of the improvements on the lands to be benefited." In none of the States where such a course has been pursued has the power of the Legislature to cause such improvements to be made in this method ever been denied; nor do we see any tenable ground upon which it can be questioned.

The fact that the lands are situated in more than one county cannot affect the power of the State to delegate authority for the establishment of a reclamation district—or an irrigation district—to the Supervisors of the county containing the greater part of the lands. Such authority may be lodged in any board or tribunal which the legislature may designate. The expense of such works may be charged against parties specially benefitted, and be made a lien upon their property. All that is required in such cases is that the charges shall be apportioned in some just and reasonable mode, according to the benefit received. Absolute equality in imposing them may not be reached; only an approximation to it may be attainable. If no direct or invidious discrimination in favor of certain persons to the prejudice of others is made, it is not an objection to the mode pursued that to some extent inequalities may arise. It may possibly be that in some portions of the country there are overflowed lands of so large an extent, or arid lands requiring irrigation, that the expense of their reclamation should properly be borne by the State. But this is a matter purely of legislative discretion. Whenever a local improvement is authorized, it is for the Legislature to prescribe the way in which the means to meet its cost shall be raised, whether by general taxation or by laying the burden upon the district especially benefited by the expenditure.

The provisions of the Act relative to the condemnation of private property, land, water, etc., for the uses prescribed therein, are in harmony with the Constitution and State laws, and in strict consonance with the views of the Supreme Court in the case of *Lux vs. Haggin*, 69 Cal. There are many other points by the various counsel for the appellant, which are some of them at war with others, but time and space do not suffice to advert to them all in detail. It seems plain that none of the objections raised to the signing of the bonds by the respondent are tenable. The Act under discussion in all respects complies with the various provisions of the State Constitution. The demurrer to the answer is sustained, and the defendant commanded to sign the bonds by a preceptory writ of mandate.

The opinion was written by Commissioner Foote.

HORTICULTURE.

Fruit Tree Propagation.

EDITORS PRESS:—Please allow a new-comer in this State, but one who has studied orchard culture most thoroughly east of the Rockies, to criticise somewhat the letter of J. S. Tibbits in the PACIFIC RURAL PRESS of May 12th.

In the first place, "natural trees," or those grown from seed where they are to stand and fruit, are not all hardy and lasting; in fact the reverse is true in severe climates. If we should plant 1000 apple seeds in the northern prairie States and attempt to grow 1000 trees from them, we would find that only about one-third of them would prove hardy, i. e., could be grown to maturity in that severe climate, and of these not more than from none to five per cent would prove entirely hardy, and perhaps none of these that would withstand all the vicissitudes of that most trying climate would bear fruit of any value. Another one-third would prove half hardy. The other third would be killed by the first severe winter. Here in this most mild climate the results would be different; also in the fine apple climate of Michigan, where Mr. Tibbits had his experience. But we who had our trials on the prairies of Northern Illinois have learned different lessons.

It is true that a tree grown from seed in the climate where the seed grew is more liable to produce a tree suited to that climate, or an acclimated tree, than one grown from seed from another climate, for we can acclimate a species, never a variety. It is true that some seedling apple trees and other seedling fruit trees are hardy and long-lived, but they are the exception and not the general rule.

We must bear in mind that the old vigorous, healthy seedling fruit trees we see scattered all over the older States are simply the survivors of the hundreds of thousands so planted. Or, to put the case in a different way, if a man should grow 10,000 apple seedlings and plant them on the prairies of Illinois or Iowa, and care for them in the best manner, it is safe to say that in 10 years half to two-thirds of them would be dead, and in 20 years he would not have living more than from 100 to 500 trees, and perhaps not more than from 1 to 10 of these would give fruit good enough to save or propagate from; yet trees grown from the seed of these survivors would be more likely to produce trees suited to the climate, and thus by continued sowings of the seeds from trees withstanding the climate best could we eventually acclimate a species, and in no other way, and by exactly such modes will California acclimate the orange and other semi tropical fruits and plants. This is a great and vital subject. I have not time to go over it fully, but the fundamental principles are correct as I have given them.

Root Grafting.

Again, there is no disagreement among fruit-tree propagators who have made the art a life-long practical study as to which is the best general plan to propagate the apple tree and most other fruit trees for orchard planting. Such men all agree that the plan well known as root grafting is, all things and points considered, the best generally. There is no disagreement on this point among disinterested practical horticulturists. Why? Simply because by that mode of propagation each and every tree eventually becomes supplied with its own natural roots; and, second, by this plan of propagation the best possible amount of old material is used. If a tree's own natural roots are the best for it, then is not root grafting the best. Varieties of grapes, currants, gooseberries, etc., have been grown from cuttings of the wood for hundreds and thousands of generations without change or deterioration; they have remained the same for ages. The root graft is very similar in its nature; or, in other words, the starting of a fruit tree by root grafting, when we use a fresh young shoot of the variety we wish to grow, and ingraft it onto a very short piece of a fresh young root, we have what Dr. Warder aptly called it, "simply a cutting helped," and in due time, if the graft grows, a perfect young tree on its own roots. [This point is open to controversy. Some growers protest against root-pieces.—EDS. PRESS.]

It is true that in some cases we find it advantageous to have a fruit tree on roots other than its own, as, for instance, the pear on the quince. [There is no advantage in California for this stock.—EDS. PRESS.] The plum or prune on the peach, the apple on the Paradise and Damsin stocks, etc. In all these cases we have the trees "worked" on different species of the same family, and to accomplish it properly we resort to budding; that is, we insert a bud from the variety we wish to propagate into a seedling a few inches above ground. A budded tree planted so deeply that the point where the bud was inserted would be a few inches beneath the surface of the soil would eventually be on its own roots. [But we do not plant this way in California nor would such high-starting roots live in our dry surface soil.—EDS. PRESS.]

We now come to a point over which there has been considerable trouble to the city-grown editors of horticultural journals. To grow an apple or pear tree by budding in the Eastern States, the very best one or two year seedlings are planted in the best soil, cultivated thoroughly, budded in the following summer and

fall; the next season the bud throws up a clean, straight shoot four to seven feet high. The next spring the shoot is cut back to four to five feet in length, and then by the second fall it is a most beautiful tree to look at—just such a tree as an inexperienced buyer will fancy; a clean, nice tree, with a fine head, and five to seven feet high. It is neat, light and straight, and will pack for shipment nicely. It is so pretty that the average farmer cannot resist the temptation, and buys it. It is really a good tree as budded trees go, except that it is coarse-grained and succulent, therefore tender, and would be a good tree to plant (except that it is headed too high for some of us) if the tree had been allowed to ripen up thoroughly in the nursery before it was dug out. But as a very general rule where nursery stock is handled in the fall, the young trees are stripped of their foliage long before the office of the leaves are complete, and the young tree goes into the planter's hands a very weak thing indeed.

Good apple trees can be produced by budding, but after planting hundreds and thousands of trees grown by both methods, I would greatly prefer those grown by root grafting. It is true that as some varieties do not form good looking roots of their own, when root grafted, some propagators have said such should be budded; but as the foliage eventually dominates the roots, such advantage would be only temporary. This last fact, which is a fact, simplifies the whole question. The roots of a tree seem to be, they are, neutral in regard to the growth of the tree. They have no formative or controlling power whatever except to furnish the tree with the crude substances of nutrition. The foliage controls all formative action, or, perhaps, to speak more concisely, they furnish the cells with neutral elaborated sap, and they by fission or self dividing make all new growths. D. B. WIER.

San Francisco.

[We publish this statement of conclusions drawn from Eastern experience partly to enable our readers to see how at variance the results are from those drawn from California experience. There are probably many points advanced which some of our readers may discuss with advantage.—EDS. PRESS.]

SERICULTURE.

Silkworms at Fresno.

Six weeks ago, says the *Fresno Expositor*, Mrs. George W. Fuller received from Mrs. Louise Reizni, secretary of the State Board of Sericulture, 4½ ounces of silkworm eggs, instructing Mrs. Fuller to take especial care, and keep the correct amounts of food consumed, the dates of the different hatches and moulting seasons. This she has done, and now furnishes us with the following facts:

From 4½ ounces of eggs there hatched between 150,000 and 200,000 worms; and as soon as they emerged from their tiny shell they had to be fed with the leaf of the mulberry tree. Mr. Fuller had a large quantity of the best Italian mulberry trees surrounding the 20-acre colony lot, situated in the B. & N. of California Tract, southwest of Fresno, and with the leaves she fed the worms, and watched them through the four moulting seasons. At the end of the fifth week they began to crawl around, searching for a place to spin. Frames were provided and they soon formed their pretty cocoons. The first week the worms ate 15 pounds of leaves per day; the second week 50 pounds; the third week 100 pounds; the fourth week 150 pounds; the fifth week 200 pounds; and now, in the sixth week, about half of them are spinning, and the balance eat 250 pounds of leaves per day. They are regularly fed three times a day, placed on trays four feet square, and it requires 32 trays to hold the amount of worms she now has. They also require to have the dry refuse leaves removed from under them every other day. The trays are made of lath one inch apart. Perforated paper, made by punching with a wad cutter, is then laid on the tray, and upon this the worms are placed and then covered with leaves. Precaution has to be taken to prevent the ants from killing the worms. The eggs furnished to Mr. Fuller were the imported Italian and make the best silk obtainable.

It requires during the last three weeks of the six the constant attention of four persons to procure the leaves and feed and care for the worms. Mrs. Fuller will stifle the ohrysalis by steaming, as it is not so liable to injure the silk as by the old way of baking. It is now clearly demonstrated that Fresno county can be made the banner county for sericulture. The heat is not too intense and it is never too cold. The thermometer ranged from 52° to 103°, and the worms never suffered from either extreme. It will be an industry that the ladies can enter into, the work being easy and pleasant, and, with the exception of a hired man during the last part of the season, there need be but little expense, and it will prove with good care that it is remunerative and instructive as well.

In this county, where the mulberry thrives without any care on the ditch banks, and the climate so well adapted to the rearing of the worm, we predict that in a few years the San Joaquin valley silk will rival the imported article. San Francisco is a good market, and the

prices paid are very satisfactory. Last season 35 or 40 Fresno ladies and gentlemen availed themselves of the opportunity to visit the room of Mr. Fuller and saw for the first time in their lives the process of silk spinning.

THE VINEYARD.

Root Rot in Vines.

Said a prominent viticulturist to a *Chronicle* reporter last week: "A fungus disease has been prevailing to a very large extent in many vineyards during the last few years, but only lately has it been prominently observed. It is doing the most damage near Cloverdale, in the Sonoma district, and near St. Helena, in Napa valley. The disease is called pourridis, and it affects the roots of the vines, causing them to rot and produce what is commonly called among vineyardists 'root rot.' This disease should not be confounded with black knot as is frequently done. The only similarity is in the sound of the names.

"The malady is one known for years in Europe, and it has affected fruit trees and those of the forest. The parts principally attacked are the southern part of France and Austria and the Mediterranean countries.

"A vine when affected shows general signs of enfeeblement, producing sometimes additional force, but this is only temporary, for it is followed with a meager production of foliage and by the rotten condition of the root, which, on being exhibited, is brown in color and saturated with water to such an extent as to show the water very plainly when it is cut. The trunk of the vine remains healthy for some time. The general appearance of the vine is that of one attacked with phylloxera. The plants sometimes continue to thrive only from 15 to 18 months, and where the conditions are most favorable to the development of the disease they even die in six months. The disease spreads in a short time over large areas. Favorable conditions are generally produced by excessive humidity in the soil and in an impermeable subsoil which forms a subterranean basin where the water becomes stagnant, a condition favorable to the introduction of the disease. The fungus which is responsible for the following disease may be introduced on the vines or even on some vegetables and on trees.

"The new fibers of a vine may show up signs of an attack, but the old roots will show swellings which even break through and protrude from the bark with a pithy growth which soon dies and rots. Before long the whole substance of the root decays to such an extent that the vine, which is far gone, may be pulled out of the soil without difficulty.

"One can only hope to so modify the conditions of the soil as to prevent the further spread of the disease and to destroy the vines on which it exists. These should be pulled up and burned on the place, so as to avoid any diffusion of the spores, which would be produced in transferring the debris. Follow this with a complete drainage and working up of the ground, and if possible leave it unplanted for several years, after which, if the excessive moisture has been provided for by proper drainage, vines may be again planted in the same spot."

"A sample of this disease," said Viticultural Officer J. H. Wheeler, when asked concerning the matter, "has just been exhibited at the Viticultural Commission office. It came from a well-known vineyard near St. Helena. Lately many other cases of the same disease have been reported. It has been just identified here in California. This disease, if I might add to what you already have, cannot flourish on well-drained and well-cultivated soil. The damage is probably great, but cannot be at present estimated, owing to the fact that but few vineyardists know its characteristics. By the way, there has been an unusual number of complaints of the increased damages to vineyards by the phylloxera. Considerable alarm is being felt for its effect on the coming crop."

Vine Hoppers.

This pest has become troublesome in some vineyards, especially so where there are young plants. Mr. S. W. Kilpatrick, who is in charge of Henry Miller's extensive orchards and vineyards in this section, assures us that a very simple, inexpensive and efficient remedy can be found in the use of concentrated lye. Mr. Kilpatrick recommends that two small cans of concentrated lye be dissolved thoroughly in one barrel (40 gallons) of water and this mixture sprayed upon the leaves and stalks of the vines, care being taken that the spraying shall be done so lightly as not to break off or injure the foliage by its force. The work should be done before sunrise or some time after sunset. By placing the barrel upon a light hand-cart it would be an easy matter to spray many acres in a few hours and at a very inconsiderable expense.

Another formula suggested by Mr. Kilpatrick, but which he does not recommend so strongly as the foregoing, is to dissolve one pound of sulphur in three gallons of milk taken from the fire at the boiling point; mix with this two quarts of kerosene, stir the whole thoroughly in one barrel (40 gallons) of water, spray with the mixture in the same manner as recommended with the concentrated lye.—*Gilroy Gazette*.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Effective Efforts.

[By MORTIMER WHITEHEAD, Lect. N. G.]

Farmers organized in the Grange, more than all other influences combined, aided in securing the present national Oleomargarine law. And farmers in the Grange have, by their influence and united action, so far prevented its repeal or any amendments that would impair its usefulness. The Agricultural Department at Washington, under the able management of Norman J. Coleman, helped to point out the fraud in oleo, and thus aided farmers greatly in securing the law. The combined oleo, cliques and rings since that time have toiled to injure the usefulness of the Department of Agriculture by taking away its Bureau of Animal Industry; but in this they have so far made no headway. The Grange stands squarely behind the department and the commissioner. Another pure-food battle is now raging in Congress, and the same parties who opposed the oleo law, and who have since worked for its defeat, and who have tried to injure the Department of Agriculture, are at work now fighting against the adulteration of lard bill. But the law will come, and after a while laws to protect producers and consumers alike against all food adulteration. It is worth the effort, and united effort will secure it.

The Order of Patrons of Husbandry is no pent-up Utica concern, as is proven by the prompt response to the call of other classes to aid in the pure food movement. The Grange has secured relief to the entire people, far greater than to its own membership, by securing the Interstate Commerce and Oleomargarine laws. It has nearly secured the reduction of postage on plants and seeds and a much needed paper fractional currency. It is now engaged in preventing the Chicago cattle ring from capturing the right arm of the Agricultural Department by getting control of the Bureau of Animal Industry. This is a matter in which the entire people are interested—they do not desire, nor will they allow, the Bureau of Animal Industry to be used by a set of monopolists to enable them to sell diseased beef as well as diseased hogs. In addition to this matter it is also engaged in the laudable work of securing for the people pure food. Every man, woman and child, and the child unborn, is directly interested in this matter, and the Grange asks your assistance in this laudable work in the interest of health and morals, as well as of agriculture and commerce. Every man and woman who can write, or who has influence over others, should at once write to their Congressmen and let them know that the people demand and will have a pure-food law. Such an Order that is working for the greatest good to the greatest number should command the respect of all intelligent and thinking people. We know prejudice exists against the Order, but it is because of ignorance of its aims and purposes. It is a purely philanthropic and educational organization among farmers which, when properly understood, must commend itself to the intelligent people of the country irrespective of vocation.

Saloon Restriction.

At a meeting of the Pacific Coast delegates to the Methodist General Conference in New York, the following resolutions were offered by Chancellor Hartson of Napa, seconded by Rev. W. S. Harrington of Oregon and unanimously adopted:

WHEREAS, There are now engaged in the sale of intoxicating liquors in the United States more than one hundred and fifty thousand retail liquor shops known as saloons, the commerce of which costs the people of the United States more than five hundred millions of dollars annually; and connected with which there is an army of habitually intemperate of one hundred thousands; and beside there are more than one-half of a million of able-bodied men engaged in some of the various departments of the liquor trade, in useless and unproductive labor; and,

Whereas, This traffic sends direct to almshouses, jails, penitentiaries, scaffolds, and to ruin more than all other causes combined, and creates an untold and inexpressible amount of crime, suffering, anguish and woe; therefore,

Resolved, That the highest interests of the people of the United States demand that legal restriction be placed upon this enormous and fatal traffic, and that we most earnestly appeal to the Pacific Coast delegates of the Republican and the Democratic National conventions to declare in their

respective platforms saloons to be the malignant enemies of the human race, and that they ought to be abolished; believing that the adoption of such measures by any party will contribute largely to its strength and honor and permanent success.

Resolved, That a copy of the foregoing resolutions and proceedings be forwarded to the aforesaid Republican and Democratic delegates, and be published in the principal papers of the Pacific Coast.

Beware of Strange Horse Traders.

Mr. Brule, a native son of *la belle France*, who lives on the southside of Tuolumne river, is noted—the Modesto Herald says—for his hospitality.

Some weeks ago there came to his ranch a stranger, having in his possession several head of horses and mules and a buckboard, of all which he represented himself to be the owner. Taking advantage of Mr. Brule's confiding nature, he traded one of the mules to him for a horse and saddle and \$25 in cash, left the balance of the stock and the buckboard with him, and "skipped," saying he would return in a few days.

Soon afterward, however, Sheriff Purvis was apprised that the animals had been stolen in Fresno county; whereupon he went to the Brule ranch and brought the animals to Modesto to await further developments.

Mr. Brule is mourning the loss of a horse, saddle and \$25 in money. It appears that the rascal had been selling stock along the road between there and Fresno. At last accounts he was still at large.

The Railroad Taxes.

The United State Supreme Court has decided that the Central Pacific need not pay its taxes because the State has no right to tax franchises given by the United States. Mr. Raymond tells a reporter of the *Alta* that the disposition of the railway is this:

There is a great need of a revision of the tax law, and I believe that railroad companies should be taxed on their gross incomes, as the most just and equitable basis. We are willing, however, to pay 60 per cent of the amount levied on our road—about \$600,000—and then we will be paying a greater tax than any single track line in the United States. Besides this State tax we pay under local assessments State taxes on our work-shops, office-buildings and depots, besides the city and county taxes. We pay more taxes to this State than any railroad corporation does to any State in the Union.

Paying taxes is not very pleasant business, we admit, but all small people have to do it and don't have the fun of saying what they will pay and what they will not pay either. They either have to shell out or the sheriff will shell them out. This comes of small people not having Supreme Courts. Should they not petition Congress to establish some for them?

Our Northern Neighbors.

During the past year Oregon has shown new life by the increased number of Granges organized. From all we can learn there was far more than ordinary interest taken in the late session of the State Grange. Oregon heartily indorsed the resolution to co-operate with California in inviting the National Grange to hold its session of 1889 in San Francisco; also in inviting the National Lecturer, Mortimer Whitehead, to visit Oregon and California, providing the Executive Committee find it feasible to secure his valuable services on this coast. The prompt manner in which Patrons seemed pleased to join in co-operating in the work of the Grange with California was very gratifying, and we believe that much good will result to both States from future unity of action.

ANTI-DEBRIS SUIT.—We learn from the *Bee* of 31st ult. that the county of Sacramento, by its attorneys, S. C. Denson and R. T. Devlin, has begun suit against William Weisler, Geo. Parker, Edward Mitchell et al., who, it is charged, are engaged in the business of hydraulic mining on the American river and tributaries, asking that defendants be restrained from dumping debris into the water-courses named. It is alleged that the streams have been filled up to such an extent as to cause overflows, causing great damage and a resort to artificial means for confining the waters within bounds. It is further alleged that the property of plaintiff—the Court-house, Hall of Records, etc., is greatly endangered. It is stated that the defendants do business under the firm name and style of the North Star Mining Claim, and an injunction is asked restraining them from so depositing any debris pending the action, and finally that a perpetual injunction issue, and an order for costs of suit.

THE mention of our visit to Oregon last week was dictated without being, as usual, revised by us before publication. This will account for any mistakes which may have been noticed, and no doubt corrected by the reader's mind.

A RIGHTEOUS JUDGMENT.—In the case of A. Martens against H. Pauls, to recover \$7500, lately tried before Judge Maguire in this city, the evidence showed that while the two men were playing cards for money they agreed to pool their winnings and buy tickets in the Louisiana Lottery. Pauls subsequently bought six coupons, and gave one of them, which he said he had purchased with the pool fund, to Martens' wife. Of the five retained one drew \$15,000, and Martens claimed that he was entitled to one-half, alleging that the winning ticket was the one in which they were jointly interested. The Judge, deciding in favor of the defendant, said: "The contract of the parties appears to have been doubly tainted with the vice and illegality of gambling; and in the relations thus created by the parties between them they are beyond the pale of civil law, and must rely solely upon the honor of each other." They were therefore "remitted to their own consciences in settling a transaction into which they entered in defiance of the laws to which they now appeal."

WM. M. CUBERY & Co., book and job printers, have furnished the secretary of the State Grange with some handsomely illuminated address cards, for which we make due acknowledgments. Cubery & Co. lead on this coast in decorative card printing. Persons desiring a handsome or neat thing in the way of address or fraternal cards, wedding cards, etc., should send to Cubery & Co., No. 415 Market street, for samples.

SAN JOSE GRANGE met on the 26th ult. and discussed the prospects of the cherry crop. Bro. Keesling gave some sensible advice to those shipping this fruit to market. Bros. Sanders, Alley and others also spoke on the same subject. Such discussions are always profitable to the members of the Grange.

THE Patron's Interstate picnic will be held as usual at Williams Grove, Pa., August 27th, continuing one week. President Cleveland is expected to attend. The attendance is expected to reach 150,000.

BRO. GEO. OHLEYER gives an entertaining account of a drive on the 25th and 26th ult. through portions of Sutter and Yuba counties in the last issue of the *Farmer*.

Vacaville Jottings.

EDITORS PRESS:—Quite a shower of rain fell last Wednesday but none since. Summer-fallowed grain in Suisun valley is looking well, and will turn out a good crop.

Considerable fruit is being sent East from Winters and Vacaville. Strong & Co. are buying around the latter place. They give their agents orders not to buy more than 300 boxes from one person—what their object is in so doing no man knows. W. Rippey is sending about 100 crates per day of apricots, peaches, and cherry plums.

A new telephone line is going up from Vacaville, and another will soon be built.

Mrs. Blake has sold the apricots which they will have on their ranch, too small for the market, for one cent per pound for drying.

A peach-pitting machine is on exhibition in Vacaville, which it is claimed will cut 1000 lbs. of peaches per hour. The general opinion seems to be that it will bruise the fruit too much.

The Brink Bros. are shipping fruit to Los Angeles, also to Newcastle.

The main question now among the fruit-growers is: "What are we going to do with our fruit contracts with J. Lusk?" Many think that it is a put-up job with the canners to escape, refusing to keep the contracts as long as they can, and force the fruit on the market and buy it at a reduced price. If such be their intentions they will fail, as they refused to take fruit unless at their own price three years ago. Only the Benicia cannery taking quite a lot, and the apricots turning out short saved the fruit-raisers then. While the first part of the crop was hard to sell at 1½ cents the last part sold quickly at three cents per pound. Nearly everybody around here is prepared to dry if a good price is not guaranteed.

Some gentlemen are expected here from the East in a few days to contract for several carloads of dried fruit. If such an arrangement can be made it will save the pay of several middlemen.

Vacaville June 2d.

THE concluding portion of "My Dream of Anarchy and Dynamite," in the June issue of the *American Magazine*, is quite as interesting as the May instalment. It shows in a graphic manner the utter helplessness of our large cities against mobs that are armed with dynamite, and indicates what remedies should immediately be adopted.

FORESTRY COMMISSIONER.—The Governor has appointed Walter S. Moore of Los Angeles a member of the State Board of Forestry, vice James Bettner, deceased.

The Permanent Exhibition Opened at Sacramento.

The standing display of products of Northern and Central California, for which the Sacramento Improvement Association has long been preparing, was thrown open to the public last Saturday afternoon. The outside of the exposition building, lately erected near the railroad station, was gaily decked with flags, while the interior was beautiful with flowers, fruits and cereals—the choicest offerings of the Sacramento valley.

Among the more noticeable exhibits were 48 glass jars of grains and seeds by Gregory Bros.; superior fruits and grains by E. Greer; fine samples of wheat by S. M. Hoover; fruit on boughs by R. D. Stephens; vegetables by J. and F. Gabriella; specimens of 35,000 young olive trees by G. H. Kunz; pumpkins by S. H. Jackman; licorice root and its products by Isaac Lee; Bartlett pears and other fruits by D. T. Lufkin.

Yuba county showed peaches, plums and cherries of excellent quality, but Placer's display of green fruit was the finest in the exhibition, her peaches especially calling forth warm praise.

At the appointed hour of opening there was present a goodly audience, whom Mayor Gregory bade welcome in behalf of the citizens and the members of the association.

Dr. G. L. Simmons, president of the Improvement Association and chairman of the occasion, spoke of the origin and necessity of the enterprise they were inaugurating. His first referred to the grave misapprehensions which have been found to exist in the minds of passing travelers respecting the soil and productions of all that portion of the State lying north of the Tehachapi range of mountains. "Thousands of these travelers," said the doctor, "have returned to their Eastern homes with no true impression of the extent of our agricultural and horticultural regions. * * * But if untrue impressions prevailed concerning soil and productions, they were exceeded by erroneous ideas concerning climate. Very naturally the word 'south' conveyed to these people inferences of warm winters, with the associated cultivation of citrus fruits, while 'north' conveyed ideas of snow or ice, from which a majority were fleeing. * * * Here (at Sacramento) are frequently found numbers of travelers with short stop-over privileges; and here, to meet this current of immigration which has flowed, and which, we believe, will continue to flow toward us from the East, the Sacramento Improvement Association, in the direct line of its policy of progress, determined to erect a place where the passing stranger might be taught by object lessons, more convincing than argument—in circular—that the productions of the great counties around us are the equal of any in our State. * * * It is not designed to hold here competitive exhibitions from the various counties who may desire to affiliate, but the purpose is rather for an exposition of choice productions in their season, and as a central place or exchange where representatives from any county may meet without expense to them, and present true and reliable information concerning their several sections. We know there is work to be done here that will repay a hundred-fold, and as we launch this enterprise upon a fair sea, let us hope that it will receive the approval and hearty co-operation of all citizens who desire the progress of Central and Northern California."

Addresses were made also by Joseph Steffans, President of the Sacramento Board of Trade, E. W. Maslin and P. W. Butler of Placer county, H. H. Camper of Butte, E. E. Lake of Solano, E. S. Parker of the Improvement Association Committee, and P. E. Platt, President of the California Fruit Union. The speeches were interspersed with music by Noack's orchestra.

In the evening the building and grounds were brilliant with electric lights, and throngs of visitors inspected the exhibits or promenaded to the strains of the full Hussar band.

The enterprise appears to be successful in its outset, even beyond the expectations of its ardent friends and promoters; and the Press joins them in hoping that as the season progresses we may then see such an interesting collection of the products of field, orchard, garden and farm, and mine, as will be worthy of a long journey to look upon.

FRUIT SALES IN CHICAGO.—Telegrams from Mr. Weinstock from Chicago announce that the auction plan of selling fruit, which he has gone to inaugurate, is meeting with favor among the prominent Chicago dealers. This is fortunate. What is wanted is something which will facilitate the distribution of fruit which will give every dealer a fair chance to secure whatever he can dispose of, and really the auction plan seems to be the best way to secure such an end. If all will take hold of it cordially it will no doubt succeed. The time has come when every outward door for California fruit must be thrown wide open.

THE first fresh figs in the San Francisco market this season were received on the 5th of June by Onesti & Connor. They were raised by H. and W. Brinck of Pleasant valley, Solano county, arrived in good order and brought half a dollar a pound.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

POWERFUL TRACTION ENGINE.—San Leandro Reporter, June 2: It is worth while to visit the big shops down by the depot these days. The way they are rattling out hay-presses, harvesters and cleaners is something remarkable. * * Among other things of interest at the works is Remington's traction engine, just arrived from Oregon. It seems capable of going anywhere and pulling anything. A big harvester, with all the machinery in gear, was pulled without apparent effort, and even when the brake was applied to the big wheels so as to lock them and make the work like pulling a cat by the tail, it still walked steadily behind it, and when it came to the steep bridge (leading up to the railroad loading platform), which has a rise of 5 feet in 16, it continued its journey, dragging the harvester after with the same apparent absence of effort that characterized all its work.

Butte.

QUEER PLACE FOR A HORN.—Oroville Register: A cow owned by W. H. Donahue, near Biggs, had something growing in her mouth which prevented her from chewing her food. Dr. C. S. Brown, V. S., examined the mouth and found it to be a genuine horn fully five inches in length and two inches in diameter at the base. A pair of forceps were applied and the horny shell was pulled off, when a knife had to be used to cut off the fleshy part remaining. The excrescence was a genuine horn, attached to one of the back molars, and so filled the mouth that it inconvenienced the animal when feeding. The point of the horn made a crook and projected from the side of the cow's mouth perhaps an inch or more in length.

Contra Costa.

SHIPPING HAY.—Martinez Item, June 1: The Grangers yesterday shipped a carload of new hay to Oakland. This is the first new hay shipped from Martinez this season.

SERICULTURE.—Antioch Ledger: Mrs. Abbott Sellers, who for two years past has been very successful in raising silkworms, has this year met with a decided reverse. When the worms were within about two weeks of spinning they died in large numbers, but a very small per cent arriving at maturity. Mrs. Sellers attributes this fatality to the very hot weather of April. Captain Mitchell has had no success with the silkworms he was feeding. In his hands they have suffered and died of cold. Mrs. J. P. Abbot secured the eggs of two moths last season; this spring when the season of growth began the teaspoonful or less of tiny globules developed a marvelous number of worms. Under her watchful care they grew and thrived, and 550 plump cocoons resulted.

El Dorado.

FRUIT CROPS.—Georgetown Gazette, May 31: The apple and pear crops in the vicinity of Georgetown promise to be large. The peach, plum and prune yield is large and fine. The cherry crop is splendid—so fine that the Newcastle fruit-shippers have contracted for all of the shipping varieties at 75 cents per 10-pound box. The output for the town limits will be some 300 boxes suited for shipping.

Humboldt.

ON TABLE BLUFF.—Cor. Humboldt Standard: On the ascent known as Table Bluff we see splendid farms on every side, yielding unfailing crops one year with another. The best evidence of the good quality of these lands is given in the fact that many of the settlers who pre-empted the land from Government 30 and 35 years ago, still own and cultivate the same. Going toward the point, or end of the bluff, you pass the fine farms of McNaughton Bros., J. F. Quill, M. Treinby, J. McGrath, A. H. Knight, W. Phelon, McNulty Bros., P. Quinn, M. Fitzsimmons, Jeff Knight, Carlin Kinman and the lands belonging to the Clark estate. All this fine body of land is covered mostly with oats, which today make a fine showing for a good yield. The acreage in potatoes is smaller than for many years. Potatoes were an unprofitable crop last year, and most of the farmers are steering clear of them this season. While all have a few acres, none are depending upon them exclusively. There is at least a fourth more grain on the bluff this year than last. The farmers on Table Bluff pay a great deal of attention to raising horses, and you can find here the best in the county. A. H. Knight is also engaged in raising mules. He has a fine jack for breeding purposes.

NICE DAIRY FARM.—Wm. Perrott, who has a magnificent tract of 750 acres, extending down to Swanger's Station, and who is largely engaged in the dairy business, is building a barn 70x90 feet. It will be the largest and best built barn in this part of the country. He has 55 cows in his dairy, and markets most of his butter at Eureka. He has 150 acres in oats, barley and peas. Mr. Perrott's place is highly improved in every respect. He has a neat, comfortable, roomy residence, nice orchard, beautiful flowers, etc. Everything denotes industry, enterprise and thrift.

BOVINE HARDWARE DEPOT.—Eureka Standard, May 31: In the stomach of a cow butchered for the Third-street market yesterday, there were found one buttonhook, one darning-needle, two safety-pins, 13 common pins, one knife blade, two lath nails, seven shingle nails, four tacks and some pieces of wire. Notwithstanding the presence in her digestive appara-

ratus of these foreign substances, the cow seemed to get on comfortably and was in good condition at the time she was killed.

Los Angeles.

SAMPLE STRAWBERRIES.—Pomona Progress, May 31: A strawberry weighing three and one-fourth ounces and another weighing exactly three ounces have been laid upon our desk by L. P. Fanning. They are the largest specimens of the fruit we have ever seen, and are truly typical Californians in their proportions. From one acre and one-half of strawberries, planted only last January by H. B. Westerman of Pomona, 1140 pounds of the fruit have been picked thus far this season, and the prices paid for it have been as high as 15 cents and as low as 10 cents a pound. Berries will be picked from the land for several weeks longer this season. Alonzo Cummings who lives west of Pomona, has already picked 2850 pounds from his one-acre strawberry lot, and will pick fully 700 and perhaps 1200 pounds more before July.

Marin.

FLOWER FESTIVAL AT SAN RAFAEL.—Journal, May 31: Last Wednesday evening the Second Annual Flower Festival took place in aid of our library and free reading-room. The decorations were beautiful. Among the finest were an exquisite violin of pansies, a lyre made of white roses and marigolds, and a tall ladder, flowery steps to knowledge, symbolizing the reading-room. These were all presented by the Misses Elliott, who have helped so much on previous occasions. The hearts of the workers were gladdened to find the net proceeds amounted to over \$150.

COWS FOR JAPAN.—C. A. P. telegram, Point Reyes, June 2: A party of Japanese cattlemen have been scouring the country lately for milk cows. They secured a large drove at prices ranging from \$40 per head upward, for exporting to Japan, where it is said milk sells at 50 cents per gallon and butter at 75 cents per pound. The cost of exportation is about \$100 per head.

Napa.

OLIVE CULTURE IN POPE VALLEY.—Cor. St. Helena Star, June 1: Mr. Worth of San Francisco a few months since purchased a tract of land from Mr. Shaffer for olive culture. He bought 10,000 cuttings of Elwood Cooper, which weighed about three tons. They reached their destination in good condition, and, we are informed by Mr. Shaffer, are all growing well.

Nevada.

RAISE HAY.—Nevada City Transcript, May 30: J. A. J. Ray, over on Shady creek, cuts from his ranch between 100 and 150 tons of hay a year, and gets \$20 a ton right on the ground. Other Nevada county farmers who have tried the business get equally good results. Hay is a crop that never fails in this part of the State. Raise hay!

MODEL MONGOLS.—As several different statements have been made in relation to the amount per annum paid by the Chinese who have such a fine garden on the Burns' ranch, the reporter interviewed the boss Chinaman yesterday, and learned from him that 21 acres have been leased for 10 years. The rental for the first three years is \$1000, and for the remaining seven years is to be \$37 per month, or \$444 per year, payable monthly in advance. These Chinamen, who have had the place for about three years, have demonstrated that the soil is not at fault if first-class grapes, strawberries, apples, pears, peaches, plums, radishes, beets, turnips, asparagus, potatoes, cabbages, onions, celery, tomatoes, beans, peas, squash, raspberries and currants are not raised in this locality. If a dozen or more such ranchers here raised as much of fruits and vegetables as do these Chinamen, they would always find a ready and profitable market.

Placer.

AMONG THE FIRST FRUITS.—Newcastle News, May 30: Henry Reith presented us a box of blackberries on Thursday last. They were from his place near Penryn. . . . J. B. Evans brought to Kellogg's fruit house on Friday last the first full baskets of blackberries in the market. On Monday he brought in a whole case of fine ripe blackberries. They were very fine looking and of the Wilson variety. . . . J. E. French who has a fine fruit farm near Pino, brought in a box of nice ripe peaches Wednesday, May 23d, which he picked from his trees that morning. These were the first peaches here this season. . . . The Newcastle Fruit Co. shipped 40 boxes of peaches to the East on Monday. Most of them were from P. W. Butler's magnificent fruit farm near Penryn. This is the first regular shipment of peaches from Newcastle this season.

ACME EVAPORATORS.—Elijah Higham is putting up two Acme steam evaporators for the curing of fruit on the premises of Mr. Geo. D. Kellogg below town, and expects to have the same ready for operation inside of a month. The evaporators will be under the sole ownership of Mr. Higham, but will be conducted in co-operation with Mr. Kellogg's fruit house, which will insure a closer selection of fruit than could otherwise be had, and at the same time afford a ready market for all the fruit that the customers of the house can supply.

THE DITCHES.—Auburn Herald, June 2: There are 250 inches of water in the main Bear river ditch. Before this, water has been running into the big tank at Pino, as the men finished laying the pipe last Monday. The water has been running into the big reservoir at Whitney's ranch for the last week. The ditch

to Clover valley is dug. The flumes, which altogether are 2500 feet in length, are being put up, and in a short time a large and fertile area will be supplied with water.

San Benito.

PROLIFIC GRAINS.—Hollister Free Lance, June 1: Steve Lyons reports fine crops up in Bitterwater valley. As a proof of the fact he brought us in yesterday samples of grain as follows: Sixty heads of barley growing from one grain; 26 heads of beardless barley growing from one grain; 39 heads of Australian wheat from one grain; 17 heads of Snowflake wheat from one grain.

STOCK THRIVING.—From all parts of the county we hear flattering reports regarding the condition of stock. Owners of cattle say that the outlook could hardly be more encouraging. The damage to dry feed by the recent rains is practically nothing.

ITEMS FROM MULBERRY.—Cor. Advance, May 28: The cool weather of the last two weeks has done much, indeed, for the recovery of growing crops from the demoralized condition in which the same was left by the "shortage" of the season's rainfall. More than half of the grain sown the past season will be cut for hay. There are some very good pieces of wheat to be seen, among which it seems to be conceded that Thos. H. Slaven has the best. Barley is light. The wild oat crop was also light this season. Range feed is already becoming scarce, and many ranchers would now sell their fat cattle.

San Diego.

HONEY.—San Diego Union, May 31: Harbison & Young report good prospects of a large honey crop from the flowers of the black sage, although the recent cool and cloudy weather has interfered somewhat with the work of the bees in the white sage and grease wood.

San Luis Obispo.

BUTTER SHIPMENTS FROM CAYUCOS.—Cor. S. L. O. Tribune: We were told by the gentleman in charge of the wharf and freight that they shipped an average of 200 boxes of butter every four days, which would bring a net value of \$26 per box, amounting to \$5200 per shipment every four days. Butter is not the only produce shipped, but there is cheese, hogs, grain, chickens, and many other articles. Grant, Watson & Co., general merchants, kindly showed us through their storehouses, where they keep on hand many thousand pounds of butter and cheese. They told us of the arrangements by which they can make drafts payable in Locarno or Bellinzona, Switzerland, which will be of great value to the Swiss population of this section.

Santa Clara.

GILROY CANNERY.—Advocate, June 2: Steam was up and machinery at the cannery in motion on Tuesday last. The shrill whistle called the hands to work, and women and girls sat around the tables picking and sorting cherries. Earnings depend altogether upon motion. The very quick can earn \$1.50 a day; the slow rarely fail to make six bits. They are in clean, airy, comfortable quarters, subject to good rules and regulations. There are at present about two tons of cherries in stock, and the whole pack of the season is expected to reach about ten tons. Prunes, pears, peaches will follow in turn and the outlook of securing a supply is so encouraging that Superintendent Spreckens says the cannery will have active employment for its machinery and its labor force during the whole season. The present stock of empty cans is about 100,000 of the two sizes 2½ and 3 pounds. Boxes are made on the premises; indeed the whole work from the first handling of fruit to the boxing for shipment will be done under the factory roof. None but the best fruit is handled, and granulated white sugar of the best brands is used. The machinery is working satisfactorily. A water-tank to hold 5000 gallons is receiving the finishing blows of the workmen, and a seven-inch bored well will be completed in a few days. The engine of five-horse power will keep the tank supplied with water for all purposes. The cannery appears to be under good management.

LARGE HAY CROP.—It is estimated that the total cut of hay on Henry Miller's lands in this valley will reach 10,000 tons.

Santa Cruz.

BEE PULP DISPOSED OF.—Pajaronian, May 31: Henry Miller, the cattle king of Gilroy, has contracted with the Western Beet-Sugar Co. for its share of the pulp at the Watsonville beet factory this season. We are informed that Mr. Miller could use and is willing to take all the pulp that comes from the factory, and that he will pay a moderate price therefor, providing the farmers pay the cost of loading on cars at the factory. If this is not done, and if the pulp is not removed within a reasonable time, it is probable that the sugar company will ship it to Mr. Miller. The disposal of the pulp has been a matter of some interest to citizens of Watsonville as well as to the factory folks, as it was feared that the smell of the pulp would be offensive. The difficulty has been obviated.

Tulare.

SUCCESS IN ORCHARDING.—Traver Advocate, May 26: C. W. Elliott of the Windsor neighborhood brought to town last Saturday the first ripe apricots we have seen this year. They were small but of delicious flavor. The trees have been set out two years and are now bearing about 35 pounds of fruit to the tree. He has a lot of raspberry bushes in bearing which are loaded down with fruit. The red variety is

now ripe, while the black raspberries are just beginning to ripen. Mr. E.'s orchard shows remarkable growth. He has a row of two old Bartlett pear trees which are loaded with fruit. Last year one of the trees bore 20 pounds, and one pear weighed 1 pound 2½ ounces. The peaches set so thick this year that he and a hired man spent several days thinning out the fruit to keep it from breaking down the trees. None of this orchard is more than four years old, but many of the trees are large, symmetrical and heavily loaded.

ON IRRIGATED LAND.—Tulare Register, June 1: The farm of Mrs. Louis Haas, just north of Grangeville and situated on the Last Chance ditch, demonstrates forcibly the possibilities of irrigated land. She has 500 acres of grain that will make as good or a better yield than last year. Meandering through her farm flow the silent waters of the above named ditch. In front of the house on the east is 14 acres of the most beautiful corn which has never had a drop of rain; west of the ditch is 500 acres of wheat, high, well formed, a beautiful gold tint, and as it is nourished by this silent little stream it majestically waves in the gentle breeze and seems to defy the withering heat of a rainless climate.

Yo'o.

ROOTING GRAPE CUTTINGS.—Davisville Cor. Yolo Democrat: E. H. Gould has a simple labor-saving method of rooting grape cuttings, which consists in placing them in boxes of convenient size, embedding the larger (or root) ends in a layer of straw, mixed with a small quantity of sand. They are then dampened, the lid nailed down and the box set in a sunny place, with the large ends of the cuttings upward. No further care is required until time to plant them, when they will be found well rooted and the equivalent of a season's growth secured without material trouble or expense.

OREGON.

BIG DROVE OF SHEEP.—East Oregonian: E. L. Wood, the well-known sheep buyer, has purchased in Eastern Oregon in the last few months, 52,000 head of sheep to drive out of the country. This means at least \$100,000 to the sheep-raisers, as the average price paid by Mr. Wood is about \$2 per head. Hersher & Boelcher have purchased in this and Morrow counties about 20,000 head, the greater number of which will be shipped direct to Chicago over the Northern Pacific railroad.

WASHINGTON TERRITORY.

WHEAT IN WHITMAN COUNTY.—Colfax Cor. Oregonian: James A. Perkins, president of the Bank of Colfax, says that four firms in Colfax handled, of the crop of 1887, an aggregate of 41,675 tons, or 1,399,167 bushels. The prices paid ranged from 45 to 55 cents, according to difficulty of reaching a point of transportation. To be sure, all of this large quantity of wheat was not actually delivered to Colfax as a shipping point, but a very large part actually was loaded on the cars here. These firms buy the wheat in all parts of the county and deliver it to the nearest shipping point. On the aggregate handled by these four business men, they paid in freight alone more than \$250,000, the rate charged being \$6.50 per ton on all rail shipments to Portland and \$7 from points on the Snake river. Grain can be shipped cheaper from Lewiston, Idaho, to Portland than from Colfax. Whitman county has about one-third more agricultural land than Walla Walla county. The total grain acreage is about 112,000, which, allowing that all is in wheat, will produce about three and one-half million bushels. As a matter of fact, the larger part is in wheat. While the acreage now actually under cultivation is not very much in excess of Walla Walla county, it has more agricultural lands and will, in a few years, have by many thousand acres more land under cultivation than any other county in the Territory. The increase of grain acreage this year over 1887 is about 20,000 acres. This county feels itself tributary to Portland, and naturally the people are seriously discontented with the situation. The burden does not fall on the Oregon Railway & Navigation Co. but on the people of Whitman county.

CULTIVATION VS. ROUGH SURFACE.—Walla Walla Union: Some farmers follow a theory that if the soil is not thoroughly cultivated—if it is left lumpy—the grain sown will be better protected from frost and the ground will retain more moisture. This season Preston Brothers of Waitsburg made an extensive and expensive experiment. They have 800 acres of land on the hills near Waitsburg. It is all of the same character of soil and has about the same "lay." A public road runs through the land, dividing it into two fields, one containing 300, the other 500 acres. Last fall the large tract was very thoroughly cultivated, the soil was made as fine and smooth as possible by plowing and harrowing, while the 300-acre field was cultivated on the "rough ground" plan. Both were sown at the same time, with the same kind and amount of seed per acre. The result is very noticeable. The 500-acre field presents a beautiful healthy appearance; the grain stalks appear close together and the promise is for an abundant yield. The 300-acre field looks like a crazy patch-work quilt. Where the grain is not frozen out, it is dying out, and the yield will undoubtedly be poor. Farmers who are inclined to follow the "rough surface" plan of wheat growing, will do well to remember the lessons taught by the experiment of the Preston Brothers.

A Few of the Trusts.

TRUST, that was nurtured in confidence
And born of honor and innocence;
Trust, that once cheered the roller's way,
Now marks the toiler for her prey,
While murdered competition cries
Vainly for justice to Freedom's skies,
And "limited production" drives
Workingmen home to their hungry wives!

Rubber and railroad iron and reapers—
Trust of them all are the makers and keepers;
Raffing, piper and ropes and rum—
The price is fixed and the buyer is dumb;
Diamonds, copper and butcher's meat,
Limbarger cheese and the envelope sheet,
Even the lead a poor man might buy
To put him out of his misery!

Undersell all who refuse to bow
To the edict that furrows the laborer's brow;
The electric lamp shall not shine for less,
Nor gas, to lighten his home's distress,
Coal and coke and kerosene oil,
The plough and the pot too empty to boil,
The paper bag for the penny cake.

Sugar and salt and shoes and the steel
The moneyless wretch at last may feel;
His sashes and blinds and the slate his lad
Must carry to school are not to be had
Save of a trust; nor his mica, his lard,
His beeswax and honey, there's nothing too hard
Or too tender, indeed, for the money-lust
Of the all-pervading pitiless trust.

Theater-posters and thrashing machines,
Trunk-lines, telephones, tin and beans,
Telegraph messages, cottonseed oil,
Oilcloth, sumach, cordage, fuel,
Cotton-duck, linseed oil and pitch—
These are the TRUSTS on which some grow rich;
But as for the penniless workingman—
Let him get trust at the shop—IF HE CAN!

—*Mercantile Mail.*

The Kindergarten.

BY EARL MARBLE.

"What is a kindergarten?" I asked of a burly, practical, hard-headed, but by no means empty-pocketed ignoramus one day.

"Oh, its a place where the brats get sense in a nonsensical sort of way," he replied.

The answer would bear studying. I felt that in an instant. So I hesitated in tongue, and kept busy in brain, while keeping my eyes on the man who stuck to his work in a stolid sort of way.

"Then it's play for the children?" I said presently.

"Well, it ain't exactly play and it ain't exactly work. That's where the laugh comes in on the young ones. They think its play, and yet they're working all the time."

I had learned a lesson already in the few moments I had stood talking with this hard-headed son of toil.

What is the origin of the kindergarten?

Maybe the readers of the RURAL PRESS would like to know.

First, as to the meaning of the word. Kindergarten means literally "children's garden."

The system of teaching that rules in these schools was first put into practice by Friedrich Froebel, who was born in Oberweissbach, Germany, April 21, 1782, and died June 21, 1852. His first educational work, "Die Menscherezhung," was published in 1826, and later he edited a weekly journal devoted to education. In 1837 he established his school at Blankenburg, Thuringia, which was largely normal, and devoted to preparing teachers for their work in the new system, which was so soon to become famous, and spread through Germany and in Switzerland as well. To aid the work, the Duke of Meiningen gave him the use of his mansion of Marienthal, near Liebenstein. His school and method prospered and became very popular for a time, and then brought down upon it the opposition of the ignorant and the narrow-minded, some of the bigoted church people and advocates of the old austerity in teaching denouncing the schools as nurseries of atheism and socialism. So rabid did the opposition become that in 1851, the Prussian Government prohibited all kindergartens in which the Froebel system of instruction prevailed. But the law was soon afterward repealed, and the method allowed full swing.

The kindergarten schools founded by Froebel consisted of large, well-ventilated, well-lighted rooms, opening into gardens, where were located play-grounds for the

younger children, and garden-plots for the older ones. Children as young as two or three years old, accompanied by mothers or nurses, were admitted, and from this age to 14 all studied, played or worked, as their age allowed, or their inclination directed, without let or hindrance, for from three to five hours. The teachers were selected with great care by Froebel, he deeming this choice of great importance, insisting that they have love for their work and love for children, with infinite patience and self-control. No corporal punishment, under any circumstances, ever was allowed, the only means of correction being expulsion from a game or from the garden for a brief time, which was always found ample for any emergency. Not more than 25 pupils were allowed to each teacher, and never so many as these unless there were children of a dozen years of age, who shared the duties of teacher with those of pupil, which fed their enthusiasm and stimulated their good behavior.

Froebel invented many games and exercises, and the six so called "gifts" which are issued in the kindergartens, consisting of six soft balls of various colors, a cylinder and a cube of various divisions and dimensions, designed to teach color, construction, algebra, geometry, etc.

The first school in this country was established in Boston between 20 and 30 years ago, and grew into favor at once, Horace Mann and his wife and sister-in-law, Elizabeth Peabody, becoming interested at once. Miss Peabody visited Germany in 1867, to make a thorough study of the system, and remained abroad nearly a year, returning and re-entering the labor with much zeal.

From that preliminary Boston work, based on Froebel's ideas, the system has grown and spread until to-day it is a strong institution, doing a grand work in a quiet but an effective way. The noblest and most unselfish people in the land are engaged in the movement, either directly as teachers and workers, or as aiders in making its good deeds known.

The work that the kindergarten schools in San Francisco has accomplished can scarcely be estimated. It has done more toward the suppression of hoodlumism, or, rather, toward restraining it, than all the policemen's bills or the judges' stern sentences.

The first kindergarten in San Francisco was started by Felix Adler, the eminent Jewish thinker and author, who came to the Pacific Coast on a lecturing tour in 1878; so all the work of the great movement has been done inside of ten years. Mr. Adler saw the need of work, and immediate work, when he came, and put his shoulders to the wheel with the earnestness born of his wonderful energy. He caused to be subscribed among his friends 130 one-dollar subscriptions, with which the movement was inaugurated by establishing the first kindergarten at 64 Silver street, which was named the Silver Street Kindergarten Association, and which had for its first president Judge Solomon Heydenfeldt. No one being found in San Francisco who was familiar with the workings of the school, word was sent to Miss Kate Smith (now Mrs. Kate Smith Wiggins) of Los Angeles, who came at once, and thus taught the first kindergarten school west of the Rocky mountains. It was opened in September, 1878.

A few weeks after the opening of the school, Mrs. Sarah B. Cooper, at the suggestion of Professor John Swett, of the Girls' High school, visited the new institution, and was at once captivated by it. The subject of hoodlumism was then creating much excitement and apprehension in the minds of all thinking people in the community; and she thought she saw in this movement a means of reforming hoodlums and eradicating hoodlumism. She went home from the school, more and more impressed with the belief, and thought so much upon the subject that she wrote a series of six articles for one of the daily papers; the first one entitled "A Remedy for Hoodlumism," and the second, "A Visit to Silver Street Kindergarten." The articles attracted much attention, and awakened great interest in the new movement.

But Mrs. Cooper was practical as well as theoretical. She had a large Bible-class at the time, and directed their attention to that field as one in which they could reap great moral and practical harvests. From that day to the present time Mrs. Cooper has given constantly of her time and attention to the good work, and looks with satisfaction on the perceptible decline of hoodlumism, acknowledged by all who have given the subject attention to be owing to the kindergartens.

The second kindergarten was started Oct. 6, 1879, at 116 Jackson street, on the Barbary Coast, the Five Points of San Francisco. It was then called the Jackson Street

Kindergarten Association, but the name has been changed to the Golden Gate. At the close of the first year, this organization numbered two classes with an enrollment of 109 pupils, and receipts of \$1805.70; at the close of the eighth year there were 15 classes with 1105 pupils, and receipts of \$17,307.50. This is only a hint of the work that has been done.

Mrs. Cooper has given nine years to the work, and has never accepted a salary.

There was an effort made some time ago to name the schools the Cooper Kindergartens; but Mrs. Cooper would not allow it, saying that she could not solicit donations consistently in such an event.

The total enrollment of children in the San Francisco Free Kindergartens is something over 3000.

Miss Emma Marwedel, the author of "Conscious Motherhood," was one of the early pioneer teachers, and trained Mrs. Wiggins in Los Angeles.

"To the rare genius of Mrs. Wiggins as a teacher and trainer," said Mrs. Cooper in conversation with a member of our staff the other day, "the kindergarten owes much of its great success."

The work has branched out and extended not only all over the State, but along the entire coast, to the British possessions, the Pacific islands, and even to Japan. The California Training School have sent out 185 teachers, who have inaugurated kindergarten work, either private or free, in Santa Barbara, Napa, Stockton, San Jose, Eureka, Arcata, Chico, Watsonville, Santa Clara, Woodland, Livermore, San Buenaventura, Oakland, Santa Cruz, Sacramento, Fresno, Riverside, Pasadena, Vallejo, West Berkeley, Marysville, San Rafael, San Luis Obispo, Los Gatos, Centerville, Menlo Park, Mayfield, Yreka, and Sausalito in this State, and the first free work in Los Angeles. Outside the State their work extends to Tucson, Arizona; Salt Lake City, Utah; Eugene City, Oregon; Portland, Oregon; Seattle, Washington Territory; Fort Vancouver, Washington Territory; Victoria, B. C.; Reno and Carson City, Nevada.

Foremost among those who have given largely to the kindergartens is Mrs. Leland Stanford, whose donations so far exceed \$30,000. She has made a careful study of it, and has devoted much time as well as money to its encouragement and support. A kindergarten is sustained by Mrs. Alexander (nee Miss Crocker), another by the wife of Senator Hearst, another by Lady Hasketh (nee Flora Shannon), and still another by the San Francisco Produce Exchange.

"Let the very playthings of your children have a bearing upon the life and work of the coming man," said the wise old Greek philosopher, Aristotle, who seems to have seen in vision the future kindergarten and its beneficial work in training aright and sending into life in better train those who else would be mental and moral cripples from the rising to the setting of the sun of their life's day of existence.

Farmers' Telegraph Line.

There has grown up among the farmers of Lenawee county, Mich., a telegraph system which is quite unique in its character, and which might be profitably and generally extended throughout the rural districts everywhere. The system began by two farmers connecting their houses with a wire for their own private convenience, and operating their line with the ordinary Morse instruments. Gradually other farmers extended the line to their houses, and after a time the wire was run into the neighboring village of Tecumseh. Seven years ago the combined farmers and a few village merchants organized themselves into a company, and it has since been extended, until now it has 65 miles of wire and 90 offices, two-thirds of the latter being in farmhouses, and nearly all the rest in stores where these farmers do their trading. One or two newspaper offices, as many more railroad freight offices, the County Telephone Exchange and the larger post-offices are all connected. Every farmer is his own operator, battery man and line repairer. Of course any quantity of private communication is kept up between the stockholders of this independent system and their connection with the village stores makes it easy to communicate their wishes as to purchases. As it happened one farmer's life was saved by the wire. By accident he took a dose of poison, and no doctor was within several miles, but the wire was connected with the doctor's office in Tecumseh, and the farmer's daughter sprang to it and called up the physician. Having ascertained the kind of poison, the doctor telegraphed back to fill the patient with sweet milk until he got there.

From one of the railroad freight stations standard time is transmitted daily at 11 o'clock.

When a piece of important news is received by the station officers, and at the newspaper office some event of great national or State importance, it is sent over the farmers' lines, and

by this means the farmers, who are regarded as slow and behind the times, are often several hours ahead of the reputedly faster denizens of the cities, who are waiting for their afternoon papers to appear. There are two or three independent systems of these lines in operation in the county, arranged so that they can be connected with each other at intersecting points, and the whole scheme is being worked very cheaply and successfully.—*New York Times.*

Can a Woman Pre-empt Land and Marry?

We alluded recently to the subject, of which the following is a fuller statement from the *Call*:

A particularly interesting land case has just been concluded by Receiver Leigh and Register Bradford of the local Land Office. It arose out of the pre-emption claim of Miss Agnes M. Crandall to 160 acres of Sonoma land, and is of much importance to the single women in the West who are holding land under the pre-emption law. After filing her application Miss Crandall married a gentleman named Perry, and about two weeks ago transmitted her final proof, together with the purchase money, so that she could obtain title to the land. It was rejected by the receiver on the ground that having married after she filed and before proving up, she was disqualified and had forfeited her right of pre-emption.

The register, however, held that the proof should be accepted and the entry allowed, maintaining that Miss Crandall's marriage did not disqualify her from taking this claim by pre-emption right, as she had continued to live on, cultivate and improve the land after becoming Mrs. Perry and until she submitted her final proof.

There being a difference of opinion by the local officials, the case will now be presented to the Commissioner of the General Land Office for his decision.

It is now the law by the secretary's decision that where a single woman claiming public land by homestead right marries, that fact does not disqualify her from perfecting her right if she continues to live on the land.

Receiver Leigh stated yesterday to a *Call* reporter that his action in Miss Crandall's case was based upon a long line of decisions, emphatically denying the right claimed by Register Bradford, and holding that a female pre-emptor lost her right on marriage.

A distinction has heretofore been made in favor of unmarried female homestead settlers, by which their marriage has not disqualified them from completing their title. It even went so far as to permit the spouses to file and prove up both claims after their union. But even this has been swept away by a Commissioner's decision, so recent as only a fortnight ago. The commissioner held that they must select which claim to perfect and surrender the other. This decision, however, is in conflict with the superior decisions of the Secretaries of the Interior, and will be disregarded.

In speaking of the distinction between pre-emption and homestead claims, Mr. Leigh said: "What the policy of the law is for the distinction can with difficulty be explained upon any other hypothesis than that every citizen has a right to a homestead, regardless of the amount of land he may own, while in a pre-emption claim the prerequisite is that the claimant shall not own 320 acres of land. The Government is very liberal in its laws on homesteads, while it pursues an opposite course in respect to pre-emptions. An endeavor has been made in the present Congress, and in fact in many former ones, to abolish pre-emptions entirely, and confine filings to homestead claims, but for some reason the legislation has always been barred."

The Receiver was strongly of the opinion that his view of Miss Crandall's filing would be adopted by the General Land Office, and suggested that it would be well for female pre-emptors to prove up before marriage. In this way trouble and expense would be avoided.

THE NOSE AND THE BRAIN.—Dr. Guye of Amsterdam has been making a study of nasal maladies and their effect on the brain. He finds that a diseased nose is often the cause of inattentiveness and dullness in children. A dull boy became quick to learn after certain tumors had been taken from the nose, and a man who had been troubled with vertigo and buzzing in the ears for 12 years, found mental labor easy after a similar operation. In a third case a medical student was similarly relieved. Dr. Guye supposes that these nasal troubles affect the brain by preventing the cerebral lymph from circulating freely.

A BRAVE FRONTIERSWOMAN.—The San Joaquin Register says that Mrs. W. H. Moore of that valley killed in one week three rattlesnakes, one having 14 rattles and a button and a body as large as a man's arm. She also killed, with a pistol, a large wildcat weighing 50 or 60 pounds, which she carried home as a trophy of her hunting abilities.

WHAT IS LISLE THREAD?—Lisle thread is a fabric that is woven from ordinary linen thread that has been first of all twisted.

A CLOSET finished with red cedar shelves and drawers is death to moths and insects.

YOUNG FOLKS' COLUMN.

The Wicked Stepmother.

Adapted from an Irish Legend.

[By MARTHA T. TYLER.]

In the good old once-upon-a-time there lived a king in Ireland who had a most beautiful wife and two sweet children, a boy and a girl. The queen unfortunately died, and in an evil hour the king married again. His second wife was of a very jealous temperament, and it displeased her to see the devotion of her husband to his children. He was particularly fond of his daughter, who closely resembled the dead queen, and although but 14 years of age, was already considered the prettiest girl in the country.

One day during the king's absence the black-hearted stepmother entered the room where the pious young princess knelt telling her rosary. The woman held a dagger in one hand and a cup of poison in the other.

"Swear on your beads," she said, "never to tell to anyone that has been christened what you will see me do," and she made as if she would stab the poor girl with the dagger in case of refusal.

The princess being helpless, took the required oath, and soon after the queen killed the king's pet dog before her eyes.

When the king returned he was very much vexed to find his favorite dead.

"Who did this?" he asked.

"It was your dear daughter," answered the stepmother. "Let her deny it if she can."

The old man cursed a little at this, and the princess said nothing at all, for she remembered the vow she had made.

A few weeks later the king went out hunting, and while he was away the horrid woman strangled the little boy, and stood his body on its head in the lobby. When her husband found it there he was dreadfully grieved, and called out in a thundering voice:

"Who has done this? By heaven, the murderer shall answer!"

"It was your darling daughter," said the stepmother, "but she hasn't a word to say in the matter."

"Take the monster out of my sight," cried the infuriated king. "Drag her into the forest and cut off her hands. Perhaps that will teach her to be less wicked."

All night long the poor princess wandered through the woods with her bleeding arms, and at daybreak she discovered a holy well, where she washed her wounds as well as she could, and was surprised and delighted to find her soft, white hands miraculously restored by reason of the virtue of the water. Hearing a noise just then she climbed a tree, the broad, low branches of which overshadowed the wonderful well, and looking down from this hiding-place, she saw a maid approaching carrying a pitcher and a slice of bread and butter.

Now, the peasant girl caught a sight of the reflection of the princess' face in the water when she stooped to fill the pitcher, and thought it was her own likeness, so she did not wait to eat her bread, but dropped the pitcher and ran back to the kitchen of the young king's palace which stood on the edge of the wood.

"Indeed," she exclaimed to the housekeeper, "you may fetch the water for yourself. I am grown altogether too handsome to serve the like of you. I ought to marry the king himself!" The indignant housekeeper pushed the servant into a dark room and turned the key on her, but two other girls who were sent to bring water came back with the same story, so that there was presently a great uproar in the kitchen, and it reached the ears of the king himself.

"Surely the creatures are bewitched," he said. "I will go myself to the well."

When he reached the spot, he, too, saw the shadow of the beautiful face, but he had sense enough to look up into the tree, where he found the lovely princess.

Of course he fell in love with her and took her home with him and married her. She would never tell him anything of her history, however, until their little boy was born; then she said:

"Come with me to King Conacht's palace. Ask me no questions, and in time you shall hear my whole story."

"But at least we may have the baby christened before we start out?" he asked.

"No, no," answered the princess. "I have my own reasons for deferring that matter." And although the king was very much astonished at this, he loved his wife too much to mistrust her, so he consented to accompany her without further delay.

From the window of his palace King Conacht saw them approaching, and in his eagerness to speak with his daughter whom he had mourned as dead, he forgot all but his affection for her.

"There is my fair daughter," he said to the wicked stepmother. "She has found a noble husband, and I am a grandfather!"

"How should it be your daughter?" screamed the jealous queen. "Look at the woman's hands."

By this time the princess, with her baby in her arms, had entered the castle yard.

"Who are you? Who are you?" cried the king. "Tell me about yourself."

"I can't tell you that, sir," said she, "because of an oath I was obliged to take never to

tell my story to any one that was christened. But my little son here was never christened, and I'll tell him everything:

My son, you must know that my wicked stepmother killed my father's favorite dog, and killed my own little brother, and made me swear never to tell any one that had received baptism about it. She got my father to have my hands cut off, and I should have died if I had not washed my arms in the holy well. My hands were restored, and a king's son made me his wife. Now I place you in my father's arms, and you shall be baptized, please God!"

But the wicked stepmother was not at the christening. She disappeared as the princess told her story, and has never been heard of again.

(Original.)

"Wun Lung" and the Bucking Broncho.

Wood Cuts and Points.—No. 1.

The lower end of Broadway, Oakland, was the scene, late one afternoon of last week, of a touching little episode in which a policeman and a bare-headed Chinaman, named "Wun Lung," cut a prominent figure, while a seedy-looking individual with a bundle of wash under his arm loomed up in the distance.

It transpired that the seedy individual had seized his washing without paying for it, and the officer was called in as a mediator. By the time Wun Lung had found a guardian of the peace, the seedy individual was two blocks away, and to expedite his capture the pagan mounted behind the officer. To insure his staying there, Wun Lung dug his heels into the animal's flanks. At first the broncho seemed a little startled at this maneuver. He appeared somewhat perturbed intellectually, and stood motionless for several seconds, apparently waiting for his mental faculties to assume their normal condition in his broad dome of thought. Then of a sudden, plug, pagan and policeman shot athwart the evening landscape. Gliding through space for a distance of about thirty feet, the sorrel broncho struck the earth with a ringing blow, legs in a wad and stiff as those of a Cardiff giant.

It was noticeable that there was a sort of rigid, determined, "I'll get there, Eli," expression about the movement.

The policeman didn't seem to care to mingle his existence with such a procession any longer, so he alighted somewhat more hastily than gracefully, and, poised on his head in the street, looked like a collapsed accordion.

In some manner, known only to Wun Lung, he managed to still retain his seat. The expression of his face, however, at that moment seemed to indicate that his left virgo had been jolted into the southern extremity of his *nux vomica*, whatever that is.

At this point in the proceedings the sad-eyed beathen opened his mouth and indulged in a respiration so powerful that all the leaves on the trees in that vicinity withered and died. Then he recoiled his wealth of raven pigtail. The horse also recoiled, and Wun Lung was saved the trouble of parting company with the native quadruped, of his own volition.

For the next few seconds the spectators saw nothing much of any thing pretty distinctly. The soft, sunset-tinted sky seemed darkened by cavorting plug and wild-eyed Chinaman occupying positions slightly remote from each other.

When the excitement subsided a little, it was discovered that Wun Lung's cue was a little disheveled and his clothing somewhat disarranged. It was found also that his lung was shifted to a position where it couldn't do him much good, and that his *sic semper servatua* had been pierced by one of his left ribs.

By this time Wun Lung's cousins began to realize that he was a physical wreck. What was once a fine specimen of robust almond-eyed shirt-destroyer was now a shapeless mass of protracted finger nails, blue shirt-tail and tufts of raven hair.

Later, the coroner went down to the scene of the calamity, and with the sponge tried to soak enough of the remains out of the ground to hold an inquest over.

The jury was divided in its opinion as to whether deceased came to his death from being kicked in the diaphragm by a robust volcano, or had been blown through the county jail by a ring-tail-puler of a cyclone.

FREMONT WOOD.

GOOD HEALTH.

Dandruff and Kerosene.

EDITORS PRESS:—A while ago some one asked what to do for dandruff. As I have never seen any answer to the question (although there may have been one that I overlooked), I will state that clear kerosene oil is the best and cheapest thing I ever used. It not only cleans off the dandruff, but makes new hair grow nicely and prevents the old from coming out. I keep a bottle of it on my toilet table and once a week wet the top of my head well with it. The warmth of the head soon drives away the scent. Then put a little perfume on your hair and it will be in a beautiful condition for a week. Those who are not troubled much with dandruff need not use the oil oftener than once in two weeks. I usually put it on my head as soon as I rise in the morning. As I have used it myself and recommended it to others for 12 years, I know what I am talking about.

Another thing I feel convinced about in my own case, is that the use of the oil upon my head has cured me of a partial deafness, from a collection of dry wax in the ear. Do not mistake me and put it into the ear, for I do not think that would be safe; but by constantly applying it outwardly it has done the work.

MRS. J. HILTON.

THE DANGER IN HOT BATHS.—It is surprising that deaths by syncope during the use of hot baths are not more common. The peril of faintness by the mere determination of blood to the surface of the body, thus quickly depriving the heart of its usual normal supply and stimulus, is very great. In cases of muscular weakness of the heart this danger must be imminent whenever the "hot" or even the "warm" bath is used. Apart from this obvious risk, however, there is always the possibility that in weakly or too impressionable states of the nervous system, the peripheral stimulation produced by the application of heat to the whole of the cutaneous extremities of the afferent nerves may so act on the centers as to arrest the evolution of energy by an inhibitory influence. It is doubtful if we lay stress enough on this condition when prescribing the use of such external agents as act on large areas of surface, and strongly impress the nerves there commencing. We know how burns of even moderate severity may kill by the impression they produce on the centers of vitality from the periphery. There is much to learn in regard to the nature and extent of the central effects which may be thus caused. Whether for good or evil, the application of heat or cold to the cutaneous surface is a potent measure, and one that ought not to be recklessly resorted to, more especially in cases of great susceptibility, involving such excitability of the nervous centers as often coexist with fairly good health in a weakly body.

THIRST IN YOUNG INFANTS.—It is a mistake to suppose that because milk is a liquid food it is at the same time a drink which is capable of satisfying the thirst of infants. Although milk appeases hunger, it makes thirst more intense after it has remained some time in the stomach and digestion of it has begun. It is thirst which causes healthy, breast-nourished infants to cry for long periods of time in many instances. There are many cases of indigestion due to weakness or insufficiency of the child's gastric juice which would be greatly benefited or even cured if the child were allowed an occasional drink of water.

SAVE THE FINGERS.—An extract from a surgical journal gives an account of the preservation of a boy's thumb, that had been severed from his hand, by the simple process of securing it to the stump and bandaging. The same paper declares that in many cases severed fingers are needlessly sacrificed.

STEEL IN A SHIP OF WAR.—The steel required for the United States ship of war Maine aggregates about 2000 tons.

DOMESTIC ECONOMY.

Tested Recipes.

[Written for the RURAL PRESS by ADA E. TAYLOR.]

Orange Pudding.—Wash the salt out of a half pound of butter; mix it with the same quantity of sugar, and a wineglass of brandy; grate the rind of three large oranges and squeeze out the juice; beat six fresh eggs, stir them into the butter and sugar, then add the prepared orange; lay a puff paste around the pudding-dish, and bake from a half to three-quarters of an hour. Eat cold with sugar; lemons may be used the same way.

Lemon Custard.—Beat the yolks of eight eggs with a half pound of sugar; add a pint of boiling water, rinds of two lemons, grated, and juice of same; boil until it thickens and then add a large wineglass of white wine, and a half glass of brandy; boil a few minutes, and put in a glass dish. Beat the whites, add half a cup of sugar, and pile on the top; to be eaten very cold.

Forcemeat Balls.—Chop two pounds of veal very fine and one onion; add parsley, a quarter of a pound of suet or salt pork; season with cayenne pepper, salt, sweet marjoram and thyme; mix all well together, make into small balls, and fry in drippings. Balls of a smaller size could be put into soup before sending to the table, and would be found a very desirable addition.

Cream Cake.—Beat the whites of seven eggs to a stiff froth; add the yolks and beat again, first adding a little salt; mix thoroughly with one cup of sugar, then stir in gently one cup of flour in which has been sifted one teaspoonful of yeast powder; last of all, stir in one-half cup of butter which has been melted; bake in jelly-tins.

Filling.—Set a tin vessel in a kettle of boiling water, and put three cups of hot water in the tin; take two tablespoonfuls of cornstarch and dissolve in cold water; pour gently into the hot water until it thickens, stirring all the time; then add one large tablespoonful of butter, one small cup of sugar and one tablespoonful of lemon or vanilla; let cool and spread between the cakes.

Custard Pudding.—Beat the whites of ten eggs to a stiff froth, add the yolks and beat again, first adding salt; stir in briskly one cup of sugar and flavoring to suit the taste; pour over the eggs and sugar one quart of boiling milk and beat thoroughly; set the pudding-dish in a tin of hot water and bake till the custard is set.

Chinese Camp, Cal.

BEEF A LA MODE.—Take a piece of the round of beef, beat it slightly and sprinkle with salt; then cut some pieces of uncooked ham and some lard about the size of a small finger; chop finely a little parsley, a couple of mushrooms and a shallot. Mix them together with pepper and salt, roll the pieces of ham and lard in them, make holes in the beef and thrust them in; lay the beef in the saucepan with a lump of lard, a few carrots and onions sliced; add a glass of wine and one pint of stock. Cover down closely and simmer for four hours, turning the beef over once or twice.

EGG OMELET.—Six fresh eggs, the yolks and whites beaten separately. One level tablespoonful of butter, one cup of new milk, into which one even tablespoonful of flour has been smoothly mixed; season with salt and pepper; pour without mixing into a hot, buttered omelet pan. Shake vigorously until the egg begins to thicken. Let the pan rest on the stove for about five seconds; then roll up the omelet. Tip the pan forward and roll the omelet with a knife in the same direction. When rolled, brown for about a quarter of a minute. Serve at once.

COFFEE PUDDING.—Soak the crumbs of a small stale loaf in some very strong black coffee; melt one ounce of butter, mix with it one ounce of sugar, one ounce chopped almonds and the beaten yolks of four eggs, then the whisked whites of three; squeeze out the bread slightly and beat it into the other ingredients, allowing sufficient to make the mixture of the consistency of a cabinet pudding; pour it into a buttered mold and bake it in a moderately hot oven, or boil and serve with sweet sauce.

LAYER NUT CAKE.—One coffee cup of white sugar, half a coffee cup of butter, half a coffee cup of sweet milk, half a coffee cup of cornstarch, whites of four eggs, two teaspoons of baking powder, flour to thicken; bake in three round tins. For the filling take one cup of sweet cream, one tablespoonful of cornstarch dissolved in cold milk; heat until it becomes thickened, then add one teaspoon of chopped hickory nut meats and two tablespoons of pulverized sugar.

TO KILL THE SMELL OF PAINT.—It is said that the smell of paint, which is frequently so unpleasant in both a new house and one that has been freshly done up, is easily removed by means of a few armfuls of thoroughly damped hay, which should be laid loosely about the rooms and passages and left for 24 hours, after which it may be taken away, and if necessary replaced by another lot.

GOLDEN PUDDING.—Mix well one-quarter of a pound each of flour, breadcrumbs, sugar and finely-minced suet. Add the same quantity of orange marmalade and one egg; pour into a well-buttered mold and steam 2½ hours.

The Week.

The week is full of politics, as the hosts of the Democracy are assembled at St. Louis. Even the telegraph wires are resonant with the notes of the brass bands and the shouts of the excited multitude. Grover Cleveland has just been enthusiastically nominated by acclamation as we are going to press. Mr. Cleveland's free trade ideas do not, however, seem to be as popular as his candidacy, for the telegraph says the Convention cannot determine to endorse his message, but may fall back on the old resolution of 1884, which was half and half. Nor does free trade seem to be a winning issue in the campaign, for Oregon at the State election on Tuesday defeated the free-trade Congressman.

Matters, other than political, are quiet. The fruit is coming on satisfactorily, and no new features of the crop are disclosed. Feed and grain are still favored by the cool, overcast skies, and in some places are making better showing than was anticipated. In the city the vacation season is casting its shadow before and cooling business ardor to a notable extent.

The Wright Irrigation Law.

Because of its importance in the advancement of California agricultural interests, we give on another page the full decision of the Supreme Court, declaring the constitutionality of the Wright Irrigation Law.

The law was a sort of a compromise between the two great forces of water rights and riparian rights, as set up by the landholders of this State. It grew out of one of the most important movements that has ever agitated our agricultural population.

When the gold seekers came here in 1849 all our natural resources were lying loose, owned by nobody, and protected by no law. Every man took what he wanted, land, water, timber, right of way, gold, anything of value to him.

While there was plenty for all, first come first served, was the universal rule. In case of dispute the pistol and knife often settled all the points, and the victor held the ground as in days of yore.

At last this rich abundance began to fail. Water was taken from the streams by miners, ranchers and ditch-owners, till the streams failed to reach their accustomed place, and the landholder on the lower ground found himself waterless.

This was peculiarly the case with Kern river in Kern county. Haggin & Carr had a monopoly ditch of large dimensions, capable of absorbing the whole river and plenty of room to spare.

Lux & Miller had previously gobbled up all the land below and wanted a living stream for the use of their stock and to make feed in the dry season. They sued Haggin & Carr for the water and for damages. They set up—

"That they were riparian owners under the common law of England. That the common law was the law of California. Under that law the water must flow to them for their use and benefit forever."

In the Superior Court of Kern county the defense was sustained, and the ditch took the water. But on appeal to the Supreme Court it was reversed, and the pleas of the plaintiff allowed.

That decision was erroneous, and must be reversed before there can be a water-peace in this State; and such a statute as will award the waters of the State to the true owners and the best interest of the people. That decision was given in utter ignorance of these facts—

"That the common law of England is law here only on these conditions as modified from time to time by the constitution of the United States and of this State, and by each and all of the statutes lawfully passed under the same.

That the inherent and inalienable rights of the American citizen give him privileges unknown to the common law of England, and which modify the common law at every step. That in England the theory is that all law is a grant from the king, and all rights not granted rest with the king.

In the United States this is just the reverse. All laws are grants from the citizen to the Government, and all not granted rests forever in the citizen, an inalienable right till he grants it.

There is every reason in California why the Supreme Court decision favoring the authority of the common law in this State should be set aside at the earliest day. Our lands need water. All the water we have is probably not enough for our final use, and there is need of an absolute control by the people, and a distribution at once equitable and for the public good.

The Wright bill is a good effort in this direction, and the decision of the Supreme Court makes it solid and reliable. Our people may safely proceed to operate under it. Our agriculture will take a step in advance in that way. But the Wright bill needs two additions that are indispensable to a just and permanent law:

First, a decision of the Supreme Court, or

an amendment to the Constitution, that riparian ownership of running water is forever abolished, or has no foundation in this State.

Second, a law of distribution of all water brought under control for use, to all persons alike, as the fourteenth amendment to the Constitution of the United States commands.

The riparianist will not forget that the water cannot be taken from him under this law. It must leave him a secure and equal share.

In fact the legislators and the courts of our country have not seemed to realize this fourteenth amendment yet. It is the best law ever yet entered on a human statute book. It should be posted up in every legislative hall and every court:

"All laws must be just and equal to all persons, and all must have the equal protection of the law."

All else is void, and courts are bound to set it aside. This alone secures the water to the whole people.

Orange Shipments.

Our southern exchanges bring very satisfactory reports of the shipments of oranges during the season which is now closing. The total amount of oranges shipped from various producing points in Southern California reaches 2250 carloads, and of these Riverside claims nearly 750 carloads, or about one-third. These figures are very creditable, and the rapid extension of the interest of the whole southern district may be inferred from the following record kept by the *Riverside Press* of the shipments from that place for a term of years, as follows:

Crop of	Carloads.
1880-81.....	15
1881-82.....	42
1882-83.....	45
1883-84.....	50
1884-85.....	456
1885-86.....	506
1886-87.....	375

The crop of last year was short for temporary reasons, and, as the *Press* notes, the increase of product in 1888 to 750 carloads "is an excellent showing for a year that has been noted for its cold winter and severe north winds. The prices, though perhaps not as high as the year previous when we only shipped 375 carloads, just one-half the present crop, have been very satisfactory, and there are many orchards that will net their possessors \$500 and upward per acre."

Much progress has also been made during the time covered by the *Riverside* record in transporting and handling the fruit at the other end, and in view of the growth of the interest, the facts are pertinent. The *Press* says:

When the orange-shipment business opened a few years ago, the price per car to Chicago was \$1200, and no systematic arrangement had been made to take care of the fruit upon its arrival at the Eastern cities. Nor did the shippers understand the art of packing in a manner to enable the fruit to stand the long journey. Since that time experience has taught many valuable lessons, agencies have been established in Chicago, New York, Philadelphia and other large cities, and the price has been reduced from \$1200 per car to \$220. From shipping on ordinary freight trains the business has increased so that regular orange trains of 10 to 15 or more carloads each leave twice a week, or oftener, if the shippers wish.

If all goes well the orange product of next year will show a notable increase, as the trees are gaining age, which gives them increase in geometrical progression.

HORTICULTURAL SOCIETIES.—B. M. Lelong, Secretary of the State Board of Horticulture, contemplates the publication of a complete list of local horticultural societies or fruit-growers' clubs, with the officers of each. There is call for such a publication to enable fruit-growers to communicate with each other for mutual information or aid. Mr. Lelong has the information he desires from some parts of the State, but to secure accuracy and completeness he would like to hear from the secretary of every organization in the State of the kind described, with names and post office addresses of officers, times and places of meeting, etc. We hope every one who sees this notice will write to Mr. Lelong at 220 Sutter St., S. F.

It is believed in local railroad circles here that the Southern Pacific Company will extend its Santa Rosa and Carquinez line into Mendocino and Humboldt counties at an early day.

The Labor Supply.

We understand that the fruit-growers of the Vacaville district are hearing favorable things of their labor supply for the coming fruit crop. We do not know how large the coming force may be, but we understand that many families from a considerable distance, as from Lake county, propose to come in and camp and work during the fruit harvest. There should be a considerable amount of this kind of labor available both in Vacaville and in other fruit centers. Many new settlers, whose trees are under bearing age, might increase their cash supplies considerably by taking themselves and their families to the orchards where young and old can earn considerably more than their living for two or three months. In many cases persons and housekeeping outfit could be loaded into the big wagon and thus transported considerable distances. We wouldn't much mind even turning ourselves and our half-dozen babies loose in one of the fine peach orchards for the summer if we had a pair of automatic scissors to run the *RURAL* with during our absence.

The bad boy is protruding again in the labor problem. This bad boy is a hard case and seems to fit no place very well. The last account of him comes from the Spreckels ranch, in Santa Cruz county, in a letter to the *Call*, which says:

The white boys drove all the Chinese off the ranch and then went on a strike. The cause of the trouble originated from the endeavor of the foreman of the place to lower the wages of the men to the sum received by boys. At the same time the wages of the Chinamen were increased. The men employed are very indignant about the matter and seem to have the sympathy of the community.

The local paper, the *Santa Cruz Sentinel*, does not give quite the same version. It says:

On Tuesday there was a strike among the boys employed in cultivating sugar beets on Spreckels' ranch at Aptos. The boys demanded that they receive as much as the Chinamen who are employed on the same place. They were receiving \$1.15 per day and wanted \$1.25 per day. As their demand was refused they quit in a body and avenged themselves by stoning the Chinamen, who fled from the scene until after the strikers had left. There were 25 boys and about 15 Chinamen employed on the ranch.

It is impossible to tell just how the affairs stood from these conflicting accounts, but general experience in this state is that farmers have no use for many boys unless their parents go along to spank them. They don't seem to be comfortable too far away from the threshing machine.

Teach Them to Shoot.

The telegraph brings an account of the hindering, gagging and violating of an unprotected young woman in Yolo county by two beasts in human form who gained entrance to the dwelling under pretence of asking food. No wonder the community is aroused and the country is being scourged, and no wonder if the villains are hung with as little mercy as they showed their victim.

These outrages have fortunately been few in California, considering the many isolated places in which women are often left unprotected, but one such occurrence as hinted at should give its lesson so sharply that no repetition should be needed. The lesson is this: Women must be armed and taught to protect themselves. If this were done, there would be far less evil practiced upon them. Any woman called upon by circumstances to journey alone or abide alone should be ready to protect herself against human fiends. In the case in Yolo county, it is reported that the poor girl ran for a shotgun, which was wrested from her. A shotgun in such a case is of little more account than a cannon would be. Arm them with small arms, which talk quickly and which can be thrust out and fired into a wretch before he can lay his fiendish hand upon his victim.

We do not believe in the idle packing about of weapons by those who do not need them or who do it for braggadocio; but for a woman whose danger is great and whose natural means of protection small, we would prescribe a revolver. Nor should it be laid away in some inaccessible place and the charges drawn. If you are in danger, daughters, sisters, wives, see that you have arms; that you are not afraid of them; that you know how to use them; and then shoot a wretch who assaults as you would a mad dog—and the community will commend you for saving yourself and freeing society of a monster.

The University Experiment Stations.

Three stations have now been established in the order in which the respective donations of land and subscriptions for buildings were tendered, viz.: Near Jackson, Amador county, near Paso Robles, San Luis Obispo county, and near Tulare City, Tulare county. Financial considerations will prevent the acceptance of any additional stations for this year.

Each one of the stations named has a tract of 20 acres of land, deeded to the University in fee simple, with the condition that the land shall revert to the original owners in case the station ceases to be occupied for the purposes specified. Two additional and adjacent pieces of six acres each have been tendered at the Amador station in order to complete the representation of soils.

At the Amador station the following improvements have already been made, or are being made, by the donors: The land has been cleared of brush and plowed; a rabbit-proof (board and wire) fence incloses it, a new wagon-road has been made, nearly a mile in length, for convenient communication with the county road to Jackson; a two-inch pipe is being laid to connect a water-wheel on the Amador ditch with a reservoir to be established on the highest hill, from which a smaller pipe will lead to the buildings, which are not yet begun. A reservoir of at least 20,000 gallons capacity is ordered to be constructed, and one of the additional six-acre tracts will be fenced as above by the University. All the improvements are being made under the local supervision of Hon. A. Caminetti.

At the Paso Robles station, where the ground was quite heavily timbered, the grubbing has been done and the holes filled, so that after removal of the wood and refuse the land will be ready for the plow. A six-board fence (with cap) has been built around the tract, and a well for water supply will be bored as soon as a well-borer can be secured. All these improvements are made by the University, under the local superintendence of J. V. Webster of Creston.

The Tulare station, a tract of 20 acres within 1½ miles of the town, donated by Mr. B. F. Moore, has but just been accepted and surveyed. Being treeless, it requires no preparation beyond fencing, and the boring of a well, which, in this case, is intended to serve for irrigation as well as other purposes, the supply of ditch water being somewhat uncertain although within reach. As water rises within ten feet of the surface, an irrigating pump and horsepower will be set for the purpose. These improvements will be made at the expense of the station fund. For the erection of buildings \$3000 has been subscribed in Tulare City and the neighboring region. Mr. B. F. Moore of Tulare City will be in charge of the improvements.

It is expected to have the buildings at all these stations ready for occupancy by Sept. 1st, when the station foremen will be put in charge.

At Berkeley the new building being erected for the purposes of the Central Station, by

joint expenditure of University and United States funds, is about closed in and will be finished and equipped by the 1st of August probably. The extra work placed upon Prof. Hilgard by the inauguration of the system of outlying stations is considerable, but he is prosecuting it with his usual earnestness and devotion.

A Trust Condemned.

The "trusts" seem to be having a hard time, as such iniquitous organizations should have. Congress and the Legislatures are after them, and the courts are not indisposed to condemn their aims and methods. We are glad to see the Supreme Court of California is moving in this direction. An opinion was rendered June 4th in the case of the Santa Clara Mill and Lumber Company vs. Isaac W. Hayes and Thomas B. Hubbard, and the decision is described in Thursday's *Chronicle*. The action was brought to recover \$10,000 for breach of contract. The defendants were manufacturers of lumber near Felton, Santa Cruz county, and agreed to deliver to the plaintiff, a corporation, during the lumber season of 1881, 2,000,000 feet of lumber at \$11 per thousand, the condition of the contract being that the defendants should not manufacture any lumber to be sold to other purchasers during such period in the counties of Monterey, Santa Cruz, San Benito or Santa Clara, forfeiting \$20 per thousand feet for any lumber sold to other parties. The defendants failed to comply with the contract.

The lower court found that the plaintiff owned three mills near Felton; that it leased all

the mills it could and made contracts similar to that with the defendants where a lease was impossible; that the sole object of the plaintiff was to "corner the market;" that the direct effect was to limit the supply of lumber, and that dealers at Felton could not buy lumber in any considerable quantity that year; that the contract was against public policy and therefore void, and that the defendants had the right to repudiate it.

This is getting at the essence of the whole business. If contracts made with corners, or to erect corners cannot hold, then the corners and trusts will speedily fall to pieces by their own weight. A wise judge!

AGRICULTURAL GRADUATE.—A young man who will graduate in the agricultural course at the State College of Maine writes to Prof. Hilgard that he is well acquainted with farming and gardening in Maine and would like to work under the instruction of a progressive California horticulturist for a compensation. Any one who thinks he can use the young man to advantage may write to Prof. Hilgard at Berkeley, stating kind of work to be done and what compensation will be given.

CALIFORNIA MAPLE SUGAR.—Now that the announcement is made of the making of sugar from the broad-leaved maple of California in Nevada county, it transpires that the sugar value of this tree has been practically demonstrated in other counties. The tree is abundant in the mountain counties, and Walter C. Robinson, living across the summit from Buck's ranch, Plumas county, writes to the *Oroville*

Register that he has a maple tract and for several years has made maple sugar. He sends a sample cake that has been kept for three years past. John Tucker at Tuckerville also has a maple camp, and in one season he made about 50 pounds. His sugar is pronounced by all to have a fine flavor. The *Register* pronounces the sample sent by Mr. Robinson of high quality.

Early Lambs.

Even if the tariff reformers succeed in knocking the wool interest to pieces, they cannot stop the production of mutton; in fact, if the large shearing flocks are decimated, there may be a better business for a limited number of people in growing mutton sheep. Those who get "spring lamb" in the fall will be the ones who will get the most money. This business is pursued by some of our farmers to a limited extent, but not so far as would probably be profitable. To all who contemplate diversifying their farming in this way, it will be interesting to see the arrangements and know the practice of F. E. Bowditch of Millwood Farm, Framingham, Mass., who is a leading grower of early lambs for the Boston market.

The engravings on this page show Mr. Bowditch's yards and shelters. Our climate does not demand such complete shelter as is needed at the East, but still the arrangement shown is interesting and may be suggestive. Fig. 1 has about 350 feet of walk along side of the pens. The second shed, Fig. 2, is about 270 feet long. These sheds are subdivided into pens, in each of which are 30 to 40 sheep. They have beside a number of box stalls for rams, ewes that refuse to own their lambs, and sheep that need doctoring. In connection with these are shearing rooms and storage quarters.

Mr. Bowditch uses Hampshire and Horned Dorset breeds of sheep of which we will speak at another time. Lambs intended for breeders are not forced but are allowed to maintain a normal growth. A little grain is kept constantly before those intended for market, and at four or five days old they begin to nibble it a little and it is not uncommon to get lambs at 30 days old that will eat one quart per day. It is composed of two parts finely ground cornmeal and one part of process oilmeal.

This year Mr. Bowditch has added to this feed new cow's milk; and he gives the fattening lambs all that they can eat, keeping two cows expressly for the purpose of acting as wet nurses to the lambs. They are fed so scientifically that at 35 days old they will dress about 25 pounds each, and are ready for market as may be required.

There is running water in each pen, and Mr. Bowditch claims that a sheep will drink from four to six quarts of water daily. Mr. Bowditch has every convenience for slaughtering and dressing, and in 15 minutes from time of leaving the pen, the lamb is in the "cooler" ready to be packed. This insures a good healthy article, much better than when the animal has been transported long distances and is more or less feverish and exhausted.

Fig. 1.—NORTH SHEEP-YARD, MILLWOOD FARM.

Pebble Beach, Pescadero, California.

A Sea Beach on the California Coast Remarkable for Silicious Gems and Mineralogical Curios.

(Written for the Press.)

Officers of the coast survey have characterized the famous Pebble beach of Pescadero as one unique of its kind and without a counterpart on the whole extent of our Atlantic and Pacific coast-lines.

Its distinguishing feature is the mass of highly polished, pure silicious gravel bordering the sea at this locality, in which the topaz, carnelian, onyx, chalcedony, turquoise, agate and jasper pebbles are found, buffed and perfected by ages of wave action as if by a lapidary.

Wave action has also eliminated all soft and angular minerals from the mass, save occasional fragments of abalone shells and chalcedony, and only the hardest stones survive the surf's eternal attrition.

Many of the topazes and carnelians are of rare clearness and beauty, and may be matched by patient search in size, form and color for jewelry, or for display in mineral cabinets.

Some fine pebbles of milk-and-fire opalescence are found; and the surf-polished crystals of pure, pailucid quartz glisten like dewdrops in the multi-colored gravel.

The carnelians are of all tints, from blood-red to the palest pink or purple; and in some rare specimens the color is singularly confined to the middle of the stone, while the exterior is perfectly limpid.

Here, too, are found agates of every color and combination, the choice of which make handsome bracelets, watch-charms and other personal trinkets when cut and set. The smaller gems, however, of clear tint, perfect form and suitable size need no touch of art or lapidary's wheel, but in their natural state, set in contrasted colors, are jewels at once unique and of special interest. Stones of this class are generally small.

But chief among the mineral curiosities of the beach are the so-called "water drops," which are most abundant on a piece of sea-marge north of the main deposit, known locally as "agate beach." These are chalcedony pebbles, more or less translucent, and usually about the size and form of a lemondrop, having a globule of water imprisoned in a central cavity, and an air bubble which, when small, looks dark by transmitted light and moves within like a living insect.

They are highly prized and much sought after by mineral and curiosity collectors. Mrs. General D. Mond of San Francisco is accorded the credit of being first to discover and direct attention to these curios of the beach.

To the non-scientific the stone-imprisoned water is a mystery not less puzzling than the milk in the coconut. If it had percolated from without it should be sea-water; on the contrary it is perfectly fresh.

The explanation is that the aqueous drop was enclosed by the silica during the process of crystallization.

These curios, though rare, are not unknown in other parts of the world; and they are occasionally met with in the vugs or cavities of quartz veins during mining operations.

It is evident, however, that only under exceptional conditions of temperature can they exist on the surface of the earth as at Pescadero, since either a temperature below 30° would freeze, or powerful sun rays would expand the water within and fracture the silicious bulbs.

On other sea-beaches washed crystals of smoky and limpid quartz occur; such crystals are plentiful at Long Branch, but I found there no other varieties worthy of note, and though many of these are beautifully clear while wet, they lose their limpidity when dry, owing to forcible impact one with another in the strong surf, which, as microscopic inspection shows, covers their surfaces with minute fractures.

At Pescadero, however, the silicious gem materials occurred in extraordinary variety and profusion; the sea floor and beach contour favored accumulation and a gentler attrition, and we have there in the fine lapidary finish of these lustrous stones the ultimate product of patient Nature and the tireless sea toiling through untold lapses of time.

Pebble gatherers are enthusiastic in their pursuit, and return again and again to the charmed precincts of the beach for new varieties, more perfect specimens, or to complete "sets."

And surely no hobby could be more innocent, more full of restful enjoyment and physical good than the gathering of these pleasing and imperishable mementoes in the exhilarant sea air and climate of the Pacific Coast, and in so delightful a locality.

But beyond its distinguishing feature, the Pescadero beach is otherwise interesting and picturesque. The receding tide leaves wide stretches of kelp-covered reefs, where fine sea-mosses and the beautiful abalone univalves may be obtained by the more adventurous visitor. Here, also, are things of interest to geologist and naturalist in the lithology of the shore, the fantastic carving and surf sculpture of the rocks, the pebble-paved pools and basins in the uncovered sea floor, hollowed as if by art, fit baths for the sea nymphs, or fabled Amphitrite, and natural aquaria rife with varied sea life, lined with mosaics of purple-spined sea-urchins, limpets, and many-tinted sea-anemones.

The botanist, too, especially one unfamiliar

with the California flora, will find much of special interest in the wildflowers, grasses and shrubs of the immediate coast-line, if he times his visit rightly, say in the period between March 1st and the close of July.

There is for the angler fairly good trouting in the Pescadero river, which rises in the higher Coast Range and courses through the village to the sea.

But better fishing may be enjoyed in several fine trout streams a few miles southward; and in the grand redwood forests east of the village, hunters and summer parties can find unrivaled retreats and camping grounds.

The Beach and the Pebble Seekers.

A mile in lineal extent north and south will embrace nearly all of the Pescadero beach deposit; and "Bobbie beach" proper is but a part of this, a crescent-shaped sweep of sea marge sheltered between rocky promontories and backed by arenaceous bluffs.

Around this crescent, on the seaward slope of clean, surf-washed and sun-warmed gravel, lie the pebble gatherers in all postures of ease, singly and in groups, sorting with unflagging interest the bright colored mass, and dropping their selections into wide-mouth bottles, cigar-boxes, or muslin bags made for the purpose.

Here is one who, with the indiscriminate zeal of a neophyte, finds lovely things on every hand, and speedily fills her bottle, her handkerchief, and other improvised receptacles with clear and many-colored stones, gems all, to her untrained eye; but here is another assiduous seeker more advanced in pebble culture, whose critical taste discards all but the perfect in color and form, and whose little vial happily holds all the gleanings of patient hours.

A smoke rises on the beach and a call is heard. This is the welcome signal that lunch is ready; and what an impromptu and enjoyable affair it is truly! Here is gyping under most charming conditions!

A campfire has been built from seadrift, and a tablecloth covers a flat-topped log, upon which cups and plates are arranged; the coffee is hot, and the sandwiches, eggs, cheese, cold meats, cakes, pies, etc., with which the baskets were bountifully filled by our hostess before leaving the hotel, are ready for appetites made keen by the pulse-stirring drive to the beach, the bracing seabreeze and the stimulus of genial rivalry in a common quest.

Formality is banished, and all the hotel guests, though but chance met to-day, mayhap eat and chat with refreshing unreserve together, after which the various finds are shown and compared; but briefly, as the fortunate are eager to renew the search, and the less lucky are inspired with new hope on seeing the "beauties" found.

The village of Pescadero (formerly a Spanish fishing settlement, as the name implies) lies out of the beaten tracks of tourists and traffic in a picturesque little valley, through which flows the Pescadero river, a limpid, mountain-trout stream, the ideal "brook" of Tennyson's poetic fancy.

It is nearly midway on the coast between San Francisco and Santa Cruz, and the nearest railway stations are at San Mateo and Redwood, from which points, and also from Santa Cruz, daily stage connections are made.

The best route is from San Francisco by the Southern Pacific railway to San Mateo; thence by stage of a very picturesque section of the Coast Range, passing through Spanishtown (Halfmoon Bay) and the ranches that border the sea, an enjoyable and typical California stage-coach ride of 30 odd miles.

But the outward trip from Pescadero by coach to Santa Cruz is a scenic treat (yet more delightful and varied character, and the traveler is alternately whirled through the foamy beach-surf of the Pacific, under cliffs, and over steep mountain buttresses, through sequestered ranches, hamlets and forest solitudes to California's greatest seaside resort; and from there through the grand redwoods and rugged scenery of the Coast mountains by the serpentine Narrow Gauge R. R. to Oakland and San Francisco.

The famous beach is two miles from the village, and there are no houses or accommodations for sojourners nearer thereto than the Swanton House.

Parties with camping outfits pitch their tents on the bluffs near the shore; but the hotel guests and villagers, according to ability or inclination, either walk to and from the beach, or go down in staging parties, which are usually made up in the morning soon after breakfast.

Pescadero is not a rendezvous of fashionable folk, nor a watering place in the usual sense; but it is a place of special attraction to anglers, hunters, campers, tourists and a cultured class whose tastes lean not to crowds and display; a favorite resort of many San Franciscans who periodically fly from the city's rout and turmoil for a term of restful change, and a spot of memorable charm to all who find joy with Nature in forest and stream, on mountain and beach, and who love the luxury of "old clothes" and the freedom of an unconventional life.

Good accommodations at reasonable rates are furnished at the Swanton house, a comfortable, unpretentious hotel with a number of detached one-story cottages for families and others desiring to dwell together.

These are bordered in roses and climbing vines, and front a pretty garden where flowers bloom almost perennially among a profusion of shrubs, exotics and shade trees that never know the blight of winter frosts.

It was from this umbrageous haunt of birds that on the odorous morning air came to my waking ears the ecstatic song of the California linnet from whose mellifluous throat, after a preluding "chic-chic," poured better-sketched a marvelous mass of liquid syllables—a carol as sweet and joyous, surely, as ever bubbled from bird heart to greet the rising sun. And between these impetuous rhapsodies, blending with the susurrs of Woodbine and acacia leaves, came dreamily to the sense the far-away lullaby of sea-murmurs, borne up from the estuary where the surf toils with the out-flowing waters of Butano creek and the Pescadero.

Strangers on the Pacific Coast are often troubled with the Spanish nomenclature there prevalent. The correct pronunciation of some familiar California names can be learned by attention to the rhyme and measure of the following jingle:

A man named Mayo
Came from Vallejo (-layho)
To San Mateo
One summer day.
Inquiring "Where, O,
Is Pescadero?"
And what's the fare, O,
To San Jose?" (Hozay)

MILES J'ANSON.

Woodside, N. J., May 7, 1888.

Santa Barbara Notes.

EDITORS PRESS:—This county is one of the fortunate ones this season, as the crops promise well in almost all particulars. The lack of rainfall is being counterbalanced by heavy dews and fogs, thus keeping the grain and bean crops growing right along. The hay crop is somewhat lighter than usual, but is of unusually good quality. Alfalfa is becoming more and more a staple product, a large percentage of the land being eminently suited to the growth of this valuable forage plant, producing from four to six good crops annually without irrigation.

Out worms are doing some damage in certain localities cutting down tender grape shoots as well as vegetables; but fortunately this pest is confined to small localities.

All kinds of fruit except apples and pears promise well. Apples generally bloomed well but dropped their fruit. Pears blossomed exceedingly full but the fruit blighted and fell off, due, probably, to the foggy weather.

Walnuts promise a good average, and are good size for this season of the year. Oranges are blooming exceptionally full, being a mass of white, and give indications of setting well. Oranges blossomed well but did not set full. Grapes are now in full bloom and promise a good yield. Being so close to the coast grapes require special care to prevent mildew, and are not very successfully grown. The quality of the grapes is good, but they bear sparingly, and so far no way has been discovered to make them fruit as heavily as in the interior counties.

The trees and vines are generally very free from insect pests and diseases, the cottony cushion scale being the only one requiring active measures to keep it down, and this, fortunately, is not widespread.

Improvements in various parts are going on. The work of paving State street in Santa Barbara is still going on with vigor. More and more artesian wells are being sunk. A fine flow has lately been struck at the Lughlin hotel, in Carpinteria, filling a two-inch pipe. The supply of water seems only restricted by the size of pipe put down. Considerable building is being done both in city and country. Mr. Blood, Sr., a veteran agriculturist, is putting up a fine house on the place which he sold to La Serena Land & Water Co., in Carpinteria valley, and in which he still holds some stock. The house will cost several thousand dollars, and is on a lovely site overlooking the Carpinteria valley, Santa Barbara city, Montecito, the Islands, ocean, etc.

The Montecito Hot Springs have been reopened in good style and is having a good run of custom. The company of soldiers that is to spend the summer at Santa Barbara will have an enlivening effect on society circles.

Carpinteria.

What's the Matter With Your Blood?

Cleveland Press.

As much blood goes through the kidneys as goes through the heart.

There is nothing startling about this fact, except it be a revelation. Many people have but a dim idea of the real work of the kidneys. They not only drain the water from the system, but also the poisonous matter which that water holds in solution to carry out of the system. Over half the time, however, the kidneys fail to do this work!

What is the result?
Gradual failure of strength and health and eventually death by Bright's Disease or some unsuspected kidney disease.

But particularly in the spring of the year, when one's blood is filled with poisonous waste, as it invariably is at that time, you feel depressed, tired, languid, do not seem to have any disease, but your system does not respond to the genial warmth of summer and spring as formerly.

You had better look out!
The kidney poison is accumulating in the blood. Tonics won't do any good, they simply treat effects. You can only secure a radical, thorough renovation of the system by the prompt use of Warner's Safe Cure, which is the only reliable, scientific specific for the blood, because it is the only known specific in the world for the kidneys, which are the only great blood purifiers.

GEORGE RIDGEWAY, 93 Murison St., Cleveland, Ohio, Ex-Dputy Sheriff, from uric acid poisoning of the blood became, at times, totally blind, and was troubled with great giddiness. In 1882, after suffering for many years, and being distressed beyond measure by thorough y purified his blood by means of Warner's Safe Cure, and says: "I have never had a day's trouble since, and have fully recovered my health. Warner's Safe Cure saved my life."

REV. J. P. ARNOLD, of Camden, Tenn., in 1878 and 1881 was grievously afflicted with many abscesses, caused by kidney poisoned blood. The abscesses were alive for many months and caused great distress. After thoroughly purifying his blood with Warner's Safe Cure in 1882, he reported that in 1888 he was 80 years old, over 70 years of age, and able to preach regularly.

CAPT. W. D. ROBINSON, United States Marine Inspector for the chain of lakes, residence, Buffalo, N. Y., in 1881 had a slight eruption on his hands. It soon spread to his face and he was almost blind. His body was covered with light flaky scales. His skin itched excruciatingly. For two years he gradually grew worse, trying almost everything imaginable. In 1883, after having given up hope of recovery, he began using Warner's Safe Cure. "Twenty bottles," he says, "completely cured me, and to-day I am strong and well as ever."

JAMES WIGHT, 276 Fifth Avenue, New York, suffered for years from inflammatory rheumatism—a blood disorder—but in 1883 was fully restored to health by Warner's Safe Cure and remains well to-day.

The four above cases are as good as a million. They prove what is stated, that the organ that removes the impurity from the blood most effectually is the kidney, and for this when impaired there is but one sound, rational method of treatment.

Dr. Dio Lewis, who was opposed to the use of medicines in general, thought so highly of this remedy that he said if he had a serious kidney disease, he should use it.

Ask your friends and neighbors what they think of it.

In the spring of the year, when debility is so prevalent, and the seeds of disease are sown that may have a fatal blossoming before the fall, the prudent man and woman will give the system a thorough cleansing and purification.

Carriages.

PALM VALLEY!

TROPICAL WONDERLAND!

EARLIEST FRUIT LAND IN THE WORLD.

EARLIEST VEGETABLE LAND IN THE WORLD.

FINEST WINTER CLIMATE IN THE WORLD.

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?

DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?

DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?

DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND COMPANY

Has secured 2000 acres of this choice land; has subdivided it into 5 and 10 acre lots, which they are now selling at \$200 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. Two hundred acres have now been sold on this basis, starting at \$150 per acre. The price is now \$200 per acre.

The Company has a Stone-walled Irrigating Canal, over ten miles in length, completed.

They have completed a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the town site owned by the Company.

They are planting 160 acres to an orange grove, of Navel oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State.

No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

THERE IS NO FROST, NO FOG, NO HARD WINDS.

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

POWELL'S PATENT DERRICK.

MOVING.

UNLOADING.

Derricks complete, with ropes and block (no nets).....	\$120 00
One long net for one wagon.....	22 00
Two short nets for one wagon.....	32 00
Powell's Patent Net Blocks, per pair.....	8 00
Powell's Patent Foot Blocks, each.....	5 00

IMPORTANT FEATURES.

The entire wagon load is hoisted up in a center opening net, by a self-braced Portable Derrick, which is moved from stack to stack ground without being taken down. Half an hour is ample time to move and set. Two nets can be used in each box, and the load taken out in two parts by having a partition in the box. Any farmer can at once see many advantages gained by the use of this invention.

One large or two small Nets used for each wagon. Parties having boxes longer than 16 feet should order two nets for each box.

In ordering nets, send inside length of box, and state whether one or two nets are required for each.

In Use Over 15 Years and never One Returned.

— THE —
"PLANO" TWINE BINDER

IS FAMED FOR ITS

LIGHTNESS, DURABILITY, SIMPLICITY and CAPACITY.

Price, 5½ feet, \$200.

Price, 6½ feet, \$210.

The Light-Running All Steel "Plano" Twine Binder, 5½ & 6½ ft. Cut.

WE HAVE A CERTAINTY ON THESE POINTS OF SUPERIORITY:

- There is not even one experiment about it.
- The wear is very slight and is easily taken up.
- It does not get out of order, for it is well made.
- It is an economizer of twine, and does not strain the band.
- The size of bundle is most easily changed.
- Tightness of bundle is most easily regulated.
- It binds either long or short grain with equal ease and certainty.
- Each bundle is completely separated, even in tangled grain.
- It is perfectly automatic and needs no attention, except proper oiling.

P. P. MAST & CO.,

American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

A Handy Accessory for the Wagon.

One of the most interesting of recent California inventions was secured through Dewey & Co.'s agency last summer by Dr. C. L. Bard of

Fresno Raisin-Growers and the Tariff.

FRESNO, June 4.—The following petition is being circulated among raisin men of this county and is being generally signed. It is considered to be an important move politically, which will have a great bearing on the coming campaign:

Hon. William M. Stewart, Senator from Nevada.—DEAR SIR: In the failure of any willing or competent representative of our own State to lift a voice in our behalf, we, the raisin-growers of Fresno county, Cal., appeal to you, the representative of another State, but a senator whose ability is the pride of the Pacific slope, irrespective of party, and whose broad statesmanship, as shown by your course in Congress, embraces not only the interests of your own State, but those of the whole coast and the entire country.

Under the kind influences of our skies and the protective policy of the Government we have been induced to inaugurate an industry new to the American continent. We have had many trials and discouragements, but have met them with fortitude, hoping for a happy outcome. No raisin vineyards in California have ever repaid any adequate profit upon the capital and labor invested. We have simply toiled on in the faith until the time of profit should come.

But now, through the grace of his majesty, the reigning President of the United States, and his followers, we are confronted with a proposed reduction of one-half a cent in the tariff upon raisins. This fraction of a cent may appear a ridiculous thing to a body like the Senate, composed of millionaires, but to us poor bread-winners it is vital, and represents the profit we have been struggling and hoping for through these years. Protection has not increased the price of raisins. Competition alone has regulated the market value. Under our disadvantages of labor and transportation the tariff is the only thing that gives us even a fighting chance. Unless Congress is willing to hold that shield before our infant industry our cause is hopeless. From the time the first box of California raisins was offered in the market the Spaniard has stood at the door, poniard in hand, endeavoring to kill the American product. It is for the honorable Senate, which we have been taught to believe is the guardian of the general weal, to determine whether the attempted assassination shall succeed or not.

We present these facts, knowing we are an humble and insignificant factor in the great economy of the Union, but trusting that you will realize that no single industry in the nation can be stricken down without injury to all, and that our poor welfare is as much to us as is to them the interest of the richest or the greatest. We put our trust in you and the honorable Senate to stand by us, otherwise we are ruined.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

last 30 ships arrived, bringing 22,699 steerage passengers.

W. H. L. BARNES and A. G. Platt have closed the sale of 7191 acres of land in the southern portion of Lake county to Mrs. Emelie Charlotte Langtry and Frederick Gebhard.

THE California Pioneers are considering a proposition to devote the old Pioneer building, on Montgomery street, to the purpose of a home for indigent and worthy members of the society.

P. P. MAST & CO.'S MACHINES.—P. P. Mast & Co. of 31 Market street, continue their large business in their own manufactures, as set forth in our advertising columns from week to week. Their line of implements includes the well-known Buckeye hay rakes, drills, seeders and cultivators, Plano twine-binders and Rustler mowers. Mast iron turbine wind engines, and Buckeye pumps, Boss sickle grinder etc. W. W. Cunningham is the local manager of the firm. The establishment is well supplied and conducted in a business-like manner.

A NEW DRIER.—The attention of our readers is directed to the advertisement of the "Best Drier," which will be found on the last page of this issue. Much care has been taken to secure an apparatus of large capacity and economical work, and the drier is put before the public with a claim of having secured these ends. The inventor will be glad of opportunity to consult with fruit-growers concerning the device and its operation.

REMOVAL.—James Linforth, the well-known agent of the Zimmerman drier, has removed his place of business to 37 Marketstreet, where he secures larger space and better location for his business.

San Buenaventura, and is called the "Western Whipsocket," though it is in reality much more than a whipsocket. It is a combination of whipsocket, oil-can and wrench, and compels the driver to carry with him the means of removing a wheel and oiling a spindle. The device is compact, ornamental and readily attached to and detached from the dash-rail. It is made of malleable iron, nicely japanned, and is less than one inch longer than the ordinary whipsocket. In no other respect do their dimensions vary. The wrench is made in different sizes so as to fit all vehicles, and the oil-can contains sufficient oil to lubricate the spindles several times. Neither rattling nor leakage can occur. The whipsocket is especially good. In it a whip touches nothing but rubber, its butt resting on a conical bottom and its body held firmly by elastic air bulbs which will not pull out. Being adjustably secured to the dash-rail, it can be removed when the vehicle is to be washed, thus preventing wetting of its interior and subsequent damage to the whip. No other socket can be so removed, and no other socket has better fastening to the dash-rail. The engravings show the whipsocket in position and detached, exhibiting the different parts. The device is being placed on the market by the Western Whipsocket Co. of San Buenaventura, whose advertisement appears on another page.

FRUIT-PITTER.—We have examined a newly invented fruit-pitter and parer which seems to be adapted for preparing fruit for market. A fuller description with cut will appear in a future issue. Mr. Dilla of Oakland is the manufacturer.

SANTA CRUZ has been visited recently by a large number of Eastern tourists.

We can supply any and all good animals that may be wanted, and at very reasonable prices and on convenient terms. Write or call on us. **PETER SAKS & SON, Lick House, S. F.** San Francisco, Cal., Oct. 22, 1886.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE! FERTILIZE! NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.
Dr. J. KERRIE—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agriculture.
BERKELEY, Nov. 20, 1886.

Dr. J. KERRIE, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Saborito, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 6, 1888.

The cool, moist, foggy weather is giving place to clearer skies and warmer weather, causing heavier receipts of farm products and a gradual sliding down in prices of seasonable fruits and garden truck. Harvesting is becoming more general in favored localities. In the grain markets at the East, and also abroad, there have been freer fluctuations. The following is to-day's cablegram:

LIVERPOOL, June 6.—Wheat—Quiet but steady. California spot lots, 65¢ to 75¢; off coast, 33¢ to 34¢ just shipped, 33¢ to 34¢; nearly due, 33¢ to 34¢; cargoes off coast and on passage, quiet but steady; French country markets, weaker; wheat and flour in Paris, rather easier; wheat on passage to Continent, 56¢ to 57¢; wheat and flour on passage to U. K., 2,418,000 qrs; weather in England, damp and unsummerlike.

Foreign Review.

LONDON, June 4.—The *Mark Lane Express* says: Values of native wheats are in favor of buyers. Flour was depressed. Foreign wheat was weak. At to-day's market wheat was slack. The best kinds were down 6d and Russian 1s. Flour was 6d cheaper. Corn was 6d to 1s lower. Oats were 3d to 6d lower. Beans, peas and Linseed were unchanged.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	92	92	91	91	90
Friday	93	—	91	92	90
Saturday	90	—	90	92	90
Monday	91	—	90	91	90
Tuesday	91	90	90	92	90

The closing prices for wheat have been as follows, at Chicago:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	84	84	84	84	84
Friday	84	—	84	84	84
Saturday	84	—	84	84	84
Monday	84	—	84	84	84
Tuesday	84	84	84	84	84

CHICAGO, June 6.—Wheat—85¢ for cash, 85¢ for June, 85¢ for July, 85¢ for August and 84¢ for Sept. Corn—54¢ for July.

NEW YORK, June 6.—Wheat—92¢ to 93¢ for cash, 92¢ to 93¢ for June, 92¢ to 93¢ for July, 93¢ to 94¢ for August and 93¢ to 94¢ for Sept.

California Products at Chicago.

CHICAGO, June 2.—There is only a moderate supply of oranges on the market here. Fruit of good quality is in fair demand and firm at the following prices: California bright fruit, $\frac{1}{2}$ box, \$3.75 to 4.00; smutty fruit, $\frac{1}{2}$ box, \$3.00; Navel, bright, $\frac{1}{2}$ box, \$5.00 to 5.50. Apricots from California have very fair trade. It is said that three carloads have been sold this week. They are quoted at \$2.25 to \$2.75 per 20-lb crate. The arrivals so far of plums from California have consisted of a common variety which no one cares for. They had a very slow sale, bringing from \$2 to \$2.25 per 20-lb crate. Cherries continue dull and slow. They are in great abundance and meet with very little demand. California sweet, fine large fruit in 10-lb boxes, express goods, quotable at \$2 to \$2.50 for Red and \$2.50 to \$2.75 for fancy White. A good many have arrived lately by freight in bad order; these had to be closed out at low prices.

California Dried Fruit—Forevaporated or bleached apricots there is a fair demand, with some advance in prices, but hundreds are, on the other hand, dull and easier; choice unpeeled, evaporated peaches are also in fair request, but other kinds and peeled stock rule slow. Plums and prunes remain slow and are quiet, but raisins are reported selling a little better on account of prices going down a trifle.

We quote: Apricots, sun-dried $\frac{1}{2}$ lb, 8½¢ to 9¢; bleached, prime 14¢; do, choice, 15¢; do, fancy, 15½¢; evaporated, choice 14¢ to 15¢; do, 16¢; peaches, sun-dried, $\frac{1}{2}$ lb, 9¢ to 10¢; do, evaporated, unpeeled, $\frac{1}{2}$ lb, 14¢; do, evaporated, peeled, $\frac{1}{2}$ lb, 16¢ to 20¢; plums unpeeled, $\frac{1}{2}$ lb, 6¢ to 7¢; pitted (dull), 10¢ to 11¢; prunes, small, $\frac{1}{2}$ lb, 6¢; do, fancy large (dull), 8½¢ to 9¢.

Raisins, loose Muscates, 2-crown, $\frac{1}{2}$ box, \$1.35 to 1.40; do, 3-crown, $\frac{1}{2}$ box, \$1.45 to 1.50; do, London Layers, $\frac{1}{2}$ box, \$2.20 to 2.25.

Hops are meeting with fair demand, and for choice qualities there is rather a firm market but off grades are quiet. Pacific Coast choice, $\frac{1}{2}$ lb, 12¢ to 13¢; do, common to prime, $\frac{1}{2}$ lb, 8¢ to 11¢.

Boston Fruit Market.

BOSTON, May 28.—MESSRS. EDITORS: Our season has been very backward so far—fully three weeks—but notwithstanding, the trade in fruits of all kinds has never been better, nor have the shippers ever realized better results. This, no doubt, is partly owing to the fact that supplies have not been quite so heavy; still the demand is good and we regard the outlook for all fruits as excellent. Delaware, at the present time, promises the largest crop of peaches ever raised—which if realized will prevent long shipments from your State of this fruit. SNOW & CO.

Wool.

NEW YORK, June 6.—The chronic, uncertain tone and sluggish action still prevails in the wool market. The cause of some of the depressions is the fact that dealers are willing to make advances on the clip. Texas reports sales to manufacturers at 14½¢ to 16¢. The dealings here are mainly in the best grades.

The following sales are reported: 10,000 lbs. Oregon, 18½¢; 17,000 lbs. at 20¢; 18,000 lbs. scoured at 35¢ to 40¢; 10,000 lbs. medium fleece at 33¢; 10,000 lbs. fine delaine at 32¢; 10,000 lbs. three-eighths blood at 33¢; 10,000 lbs. extra pulled at 35¢; 20,000 lbs. extra pulled at 35¢; 20,000 lbs. N and N Ohio, 28¢ to 29¢; 50,000 lbs. spring Texas at 14½¢ to 15¢; 15,000 lbs. scoured spring Texas at 45¢ to 47¢; 196,000 lbs. domestic, mostly choice, 46¢ bales foreign, chiefly Mediterranean, 114 bags, on private terms.

The Philadelphia market reports operations mainly for necessities, and lower prices prevail, with sales of 2,600,000 lbs.

The Boston market was never so unsatisfactory,

and buyers' bids are low. The sales include 1,252,000 lbs. domestic, including 295,000 lbs. California spring at 12¢ to 21¢ and 40,000 lbs. fall at 8¢ to 14¢, also 1,994,000 lbs. of foreign.

California Fruits in Chicago.

CHICAGO, June 5.—Mr. Weinstein, representing the California Fruit Union, says the newly presented scheme of selling fruit by public auction instead of by private sale through commission houses as heretofore, is meeting with great favor among all the prominent Chicago dealers, most of whom express themselves as being in sympathy with the movement.

Miscellaneous.

NEW YORK, June 5.—Free arrivals of hides have curtailed the extreme views of holders, and 16c is a very full price for the best to make sales. More activity is reasonably looked for.

Hops have been sold to a degree indicating growing wants, but the old rates are full. With reduced Eastern stocks and little new coming forward, the market ought to be in better shape.

Raisins are working out steadily, with prices well supported. Other dried fruits are very quiet.

The first California peaches came to-day. About 2000 sold at from 75¢ to \$1 a dozen.

Apricots sell well at from \$4 to \$4.50 for the 10 lb case.

Local Markets.

BAGS—The pool is still trying all means possible to keep values of grain bags up. The market is quoted at from 7½¢ to 7¾¢. The demand is only fair.

BARLEY—In the sample market, there is nothing new to report. The demand is good and prices firm. New was received, but weighs less than the first received last year. In options, there has been more trading, with prices strengthening. The following are to-day's sales:

Morning Session: Buyer 1888—200 tons, 98½¢ per cwt. Afternoon Session: Buyer 1888—400 tons, 98½¢; 100, 98¢; 200, 97½¢; 100, 97¢. Seller 1888, new—100 tons, 89¢ per cwt.

FLOUR—The market is steady, with a good demand ruling.

WHEAT—In the sample market, there is a steady feeling, although buyers are trying to beat values to a still lower range. In options, trading has been free, with good and attractive fluctuations. The following are to-day's sales:

Morning Session: Buyer season—100 tons, \$1.50 to \$1.55; 100, \$1.49 to \$1.50. Buyer 1888—200 tons, \$1.49 to \$1.50; 100, \$1.49 to \$1.50. Afternoon Session: Buyer 1888—300 tons, \$1.49 to \$1.50 per cwt.

EGGS—The market is shading off slowly, under freer receipts and a lessening consumption.

BUTTER—Under heavy receipts, the market is sagging off. Packing is going on very freely. The East is sending us liberal supplies, which is against better prices for Californian.

CHEESE—The market is barely steady. The East reports a sinking market, with still lower prices looked for, which will be against our market later on, as heavy shipments will be made here.

[COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco, from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 '86 to June 4, '87.	July 1 '87 to June 2, '88.
Flour, qr. sks.	3,982,183	3,513,339
Wheat, cts.	12,230,678	8,202,231
Barley, cts.	2,203,150	2,245,157
Oats, cts.	133,156	152,909
Potatoes, sks.	799,890	1,070,637
Corn, sks.	113,621	231,697
Rye, sks.	26,174	17,433
Buckwheat, sks.	5,865	3,054
Beans, sks.	434,159	389,447
Bran, sks.	427,055	478,071
Hay, tons.	98,929	112,076
Salt, tons.	21,988	16,410
Wool, bales.	80,421	71,887
Hides, No.	103,448	101,300

Friday	—	.96
Saturday	—	.92
Monday	1.09	.92
Tuesday	—	.92

H. Kains Jackson writing to the *Farmers' Journal*, London, says: "Scarcely any reaction in price has followed on the change to summerlike weather which has distinguished the past week. The growth of vegetation is now very rapid, the progress of the season such as to at least commence making atonement for the extraordinarily protracted winter. The early sown barley has come up well, and wheat if very backward in growth looks well in color and is healthy. The ground is in a good state for getting in potatoes and mangolds, and the pastures are

growing as they should be in May, apace. The markets under those circumstances might ordinarily have been expected to show some tendency to retrogression, but the importance of the home crop is not now what it was even 10 years ago. The news of American harvest prospects weighs far more heavily than intelligence from Lincolnshire or Norfolk, and American news within the past week has assumed a very sombre hue. That the reports of damage to the growing crops are the result of the intrigues of speculators is rendered a matter very difficult of belief, seeing how generally the reports in question find credence in America itself, where in-tant contradiction could be given to such statements as that in Ohio large acres of winter-sown wheat land are being plowed up, or that Illinois and Indiana do not promise more than two-thirds of a winter wheat crop."

In Southern Russia the sowing of spring wheat has been completed under favorable circumstances, and vegetation is making good progress.

The new maize crop in the Argentine Confederation is stated to be of excellent quality and generally in sound condition.

From the Continent of Europe there is nothing fresh to report. The lateness of the season is causing apprehension, especially in France, but markets remain without quable change.

Advices from India are to the effect that there is a disposition to store wheat for the present rather than accept present prices.

In Buenos Ayres, March, the maize harvest was in progress with weather warm and dry. The estimate that one-third of the crop was lost seems to be confirmed. The yield is unequal as one to five, and the aggregate difficult to estimate.

A Liverpool merchant's letter received this week says: "La Plata maize is reported as no failure, but not so large a crop as in 1887, but fine and well conditioned. Value for shipment shows a large discount on the spot price, and as your market seems quite controlled by speculators we expect maize will rule dear all the year."

In commenting on the flour market a New York paper says: "In the winter wheat States more than two-thirds of the mills are idle for want of wheat; in instances they are not able to obtain wheat enough to supply their surrounding trade. Careful inquiry by persons in our employ at a very large number of mills, we find that they hold no considerable stocks, and are not likely to add much to them till August, and even then it is very questionable if farmers will be willing to sell their new crop unless at very high prices. Some of our correspondents express grave apprehensions as to the probable yield of wheat, as a minute examination fully confirms these convictions. The war of moisture over a vast area of country last autumn prevented the wheat stooling properly, hence much disappointment in the quantity harvested seems certain. It is quite remarkable that the weather in Europe is as backward as it is in this country, consequently greater interest is manifested in the growing crops than usual."

The New York Produce Exchange Reporter, May 26th, says: "Information in regard to the quantity in farmers' hands is overwhelming in confirming our position. In some of the great producing States there is absolutely a great dearth of supplies and this has been the fact over a large area of country since last autumn, hence we are at a loss to learn where these liberal invisible supplies are, which are said to exceed those of last year materially. This statement was a great mistake and much loss has resulted in consequence. The reduced state of available supplies in the spring and winter wheat States is now very generally admitted by all intelligent observers, and it is evident that whatever is taken for export is being drawn from our usual reserves, and these will be reduced on the first of July next to less than 25,000,000 bu., and the visible will be rapidly exhausted and will be smaller on the first of July than for some time past. The late seed time at the Northwest adds greatly to the uncertainty of the crop, and prudent merchants will act wisely if they refrain from taking the short side of the market, as the crops in Europe are generally very late and the low temperature much of the time the past six weeks renders an early crop almost impossible, and we regard the future of wheat as more than usually interesting. The business in spot wheat has been remarkably small for the season, and with a limited export call for any one disposed to sell, has been compelled to yield. With so great a falling off in the export movement, we think prices have been remarkably well sustained. The reaction in the speculative market was to be expected and is healthy."

Oregon advises report the wheat and oat surplus light, under steady outward shipments. The dry weather cause many to look for only a three-quarter crop in oats, wheat and barley. The quality, it is also thought, will be poor.

In this State, crop advices are of the same tenor as heretofore reported. It is now generally admitted that owing to the moist, cloudy, foggy weather, the bulk of the grain on the coast counties will be off-colored. The cool weather is causing grain to fill out well. Many fields having short straw will turn out a fair crop. But then, even with this improvement, the crop of neither barley nor wheat will equal last year's.

The first carload of new barley arrived to-day. It was shipped by H. Timm of Dixon, and consigned to Eppinger & Co. of this city. The consignment was sold by sample to Laumeister at 92½¢, who resold the same at 95¢. It is a bright, clean and pretty lot, weighing 43½ lbs to the bushel. Since 1870, the dates of arrival of new barley in this city and the prices at which the first lots have been sold have been as follows:

Year.	Date.	Price.
1870	June 19	\$1.20 1/2
1871	June 12	1.57
1872	June 6	1.40
1873	June 5	1.10
1874	June 9	1.45
1875	June 20	1.35
1876	May 30	.90
1877	June 30	1.55
1878	June 11	.80
1879	June 30	.75
1880	June 24	.64 1/2
1881	June 21	.90
1882	June 12	1.65
1883	June 25	.95
1884	June 28	.90
1885	June 16	1.25
1886	May 26	1.28
1887	June 3	1.15
1888	June 6	.92 1/2

Last year the first lot arrived on the 3d of June to the same consignees from Tremont, near Dixon. It turned the scale at 48 lbs to the bu., and was sold to the Laumeister mills at \$1.15.

The local wheat market held steady the past week, with a strong undertone. It is seldom that the values rule so firm toward the close of the season. Ships are weak and it is not at all unlikely but freight rat-s will rule low throughout the year.

Barley continues strong with present stocks under good control, particularly the more choice. The consumptive demand is large. Oregon will have a small crop this year. She had a surplus in 1887.

Oats have been gradually creeping up owing to a growing scarcity in Oregon and consequently lighter receipts here. The Oregon crop will be light.

Corn is without essential change. The demand is good considering the high price. At the East the season is backward. There is an increased acreage planted.

Rye and buckwheat are nominally unchanged. In the former the offerings although light are ample.

Fruits.

Clearer skies and warmer weather are ripening the fruit crops quite rapidly, or at least the writer judges so from the increasing receipts. As usual buyers try every means to break prices. Cherries are coming in freely, many of the consignments show the effects of the late rains. Canners are paying from 6 to 7¢ for Royal Annes. The crop of this variety is light, not much more than 75 per cent of that of 1887. For canning varieties of black they pay from 4 to 6¢. Hucksters have been able to buy quite freely the past week of over ripe or otherwise poor cherries at low prices. In apricots canners are bidding from 2½¢ to 3¢ delivered here for entire orchards, while doing this they at times pay as high as 3¢ for selected. Orchardists at 2½¢ are said to be drying. Peaches are arriving more freely and consequently are shading in prices while improving in quality. Canners as a rule are not contracting for many, preferring to take their chances in the open market later on. Apples are without essential change. The receipts of raspberries and blackberries are increasing and prices declining. In currants canners to clean up receipts pay on an average of \$2.50 per cwt.

In dried fruits the market is well cleaned up. It is difficult to get enough to make shipments. The same remarks apply to raisins.

Eastern mail advices report the Carolina cherry crop almost a failure.

Feedstuff.

Bran and middings are slightly lower. The demand for all kinds of ground feed is quite active for the season.

Dealers in hay do not appear disposed to anticipate their wants. They still buy in a hand-to-mouth way, in expectation that under a strong selling pressure prices will break. Receipts continue free, but then the consumption is large and steadily increasing.

Live-Stock.

Oregon advices report feed very scarce and in consequence catlemen have been and are still marketing their stock. In this State large owners have driven back into the mountain ranges. There will probably be more stall-fed cattle this year with higher prices later on. In mutton sheep the market is steadier with a slightly firmer tone. Calves are scarce. Hogs are without essential change. It looks as if the selling pressure for the present is about over. Private telegrams from Chicago and Kansas City report receipts light, market strengthening with higher prices looked for. In horses there is absolutely nothing new to report. The demand for bridle horses, matched teams, etc., continues good.

The market for dressed meat is quotable as follows by slaughtermen to butchers (to get the price of stock on foot, take off one-third of the price for stall and grain fed and one-half from the price of grass fed, that is, animals running at large.)

HOGS—On foot, grain fed, 6½¢ to 6¼¢ per lb.; dressed, 9¢ to 9½¢ per lb.; soft, 5½¢ to 6¢ per lb.; dressed, 8½¢ to 9½¢ per lb. Stock hogs, 4½¢ to 5¢ per lb.

BEEF—Stall fed, 8¢ to 8½¢ per lb.; grass fed, extra, 7½¢ to 7¾¢ per lb.; first quality, 6½¢ to 6¾¢ per lb.; second quality 6¢ to 6½¢ per lb.; third quality, 5¢ to 5½¢ per lb.

VEAL—Choice 8¢ to 9¢ per lb.; fair to good, 6¢ to 7¢.

MUTTON—Wethers, 5½¢ to 6½¢ per lb.; ewes, 5¢ to 5½¢ per lb.; lamb, spring, 7¢ to 8¢ per lb.

Vegetables.

The market is better supplied with all varieties, except asparagus and rhubarb. Under liberal receipts prices have shaded off with considerable fluctuations reported from day to day—prices being governed by the supply. Some kinds have not touched bottom prices, but others have probably seen their lowest. Canners are still taking peas and beans.

The market for potatoes cleans up well under free shipments out of the State. Only the more choice, well-matured are given preference. The home consumption continues free. The Oregon crop is reported to be light.

Onions are improving in quality, and consequently go off more freely. Receipts continue ample.

Miscellaneous.

Beans are slow with some shading in prices for all kinds except choice grades which are in light stock. Poultry is kept down by continued receipts from points west of the Missouri river.

In hops there is nothing new to report. The consumption has been kept down by cool weather so far this year.

In wool trading continues light. Growers are generally storing. To sell, quotations would have to be submitted to, but to buy higher prices would have to be paid. The general feeling is that prices will be higher later on in the year.

Honey is weakening under freer offerings and buyers bidding down owing to reports of a large crop this year. The quality is said to be better than last years.

The tonnage movement compares with last year at this date as follows:

	1888.	1887.
On the way	406,630	259,196
In port, disengaged	64,520	111,038
In port, engaged	12,459	20,797

Totals

To obtain the carrying capacity, add 60 per cent to the tonnage.

Tonnage on the way to Oregon, 15,077; tonnage at Portland, Oregon, loading and to load, 19,114. Total tonnage, 34,191.

HAY PRESSES!

THE HURRICANE—Size A.

A mounted, horizontal double-ender. Size of bale, when in the press, 17x22-10 inches. Average weight of bale, 220 pounds. Capacity, from 16 to 25 tons per day. Uses 4 men and works with 2 horses. Requires no TRAMPING. Puts 10 tons or over in a box car.

Price.....\$1000.

THE HURRICANE—Size B.

Size of bale in press, 22x24x46 inches. Average weight of bale, 260 pounds. Capacity, from 20 to 35 tons per day. Uses 5 men and works with 1 or 2 horses, at option of baler. Requires no TRAMPING. Uses rope or wire. Puts from 7 to 8 tons in a box car.

Price.....\$1000.

MONARCH CAR PRESS
10 TONS BOX CAR \$600
MONARCH JR. ORDINARY BALE \$500
THE MONARCH—
THE BEST SMALL
HALE CAR PRESS IN THE
WORLD.

The SELF-TRAMPING JUNIOR MONARCH

Size of bale in press, 22x24x46 inches. Average weight of bales, 260 pounds. Capacity, from 15 to 25 tons per day. Uses 3 or 4 men, at option of baler. Works with 1 or 2 horses. Uses rope or wire. Does its own TRAMPING. Puts from 7 to 8 tons in a box car.

Price.....\$500.

THE MONARCH.

Same principle as Junior Monarch, only smaller and heavier. Size of bale, when in press, 17x20x40 inches. Average weight of bale, 220 pounds. Capacity, from 12 to 20 tons per day. Requires 3 men and 2 horses. Uses rope or wire only will not hold. Does its own TRAMPING. Puts 10 tons or over in a box car.

Price.....\$600

THE GENUINE PRICE PETALUMA.

Size of bale in press, 24x24x50 inches. Average weight of bale, 250 pounds. Capacity, from 10 to 18 tons per day. Requires 4 men and 2 horses. Uses rope or wire. Hay has to be tramped into the press. Puts from 5 to 6 1/2 tons in a box car.

Price.....\$350.

THE IMPROVED EAGLE.

Size of bale in press, 26x26x60 inches. Average weight of bale, 235 pounds. Capacity, from 10 to 15 tons per day. Requires 4 men and 2 horses. Uses rope or wire. Hay must be tramped in the press. Puts from 4 1/2 to 5 1/2 tons in a box car.

Price.....\$250.

The above is the finest line of Baling Presses in the United States. They are nearly double the capacity of those of other makers.

BRONSON PITTS THRESHING MACHINES

THE BRONSON SEPARATOR, WITH RECLENER INCORPORATED IN THE MACHINE, AND FAN IN STRAW RAKE. (Fan in Straw Rake is not shown in above cut. The Self-Feeder shown is not included in prices named below.)

32-inch Cylinder, with Sieves 44 inches wide, having extra enlarged separating capacity, with Recleaner; and Fan in Straw Rake.....	\$1100 00
36-inch Cylinder, with Sieves 52 inches wide, having extra enlarged separating capacity, with Recleaner; and Fan in Straw Rake.....	1250 00
40-inch Cylinder, with Sieves 56 inches wide, having extra enlarged separating capacity, with Recleaner; and Fan in Straw Rake.....	1300 00
The above separators have Iron Axle Wagons, 5-inch Tires, Chaff Carriers, 12 Double Bar Cylinder, Cast Steel Cylinder Shafts, Steel Laid Teeth, Extra Large Cleaning Capacity, entire machine highly finished.	
Large Band Jacks.....	\$40 00

The Bronson Improvement on the Buffalo Pitts Threshers consists of a set of long, agitating fingers, extending from beneath the cylinder to the grain belt. These fingers have a longitudinal, as well as rising and falling motion. As the grain and straw are discharged from the cylinder, the straw is caught on the fingers and shaken out loose, and at the same time carried forward (by the longitudinal motion, assisted by the first Beater) on to the top of grain belt. At the same time the grain is shot through the loose straw to a sheet-iron pan (below the fingers), which, having the same longitudinal motion as the fingers, discharges the grain into the grain-belt cells before they have been covered by the straw.

The longitudinal motions of the Fingers and End-Shake Shoe operate to counteract each other, both being driven from the same crank shaft, but in opposite directions.

SPECIAL IMPROVEMENTS.

Although for the past two or three years we have felt each year that our Threshers had arrived at a degree of perfection that left no room for improvement, yet each succeeding year we have been able to do "a little better," and for this year we have an unusually brilliant list.

San Francisco **BAKER & HAMILTON**, Sacramento.
Sole Agents for the Pacific Coast.

FIG. 2.

FIG. 1.

Referring to the accompanying cuts, Fig. 1 represents a longitudinal sketch of largest sized Drier of this kind, having a capacity of 50 tons of grapes. It has 2500 trays placed on 14 cars, occupying a drying chamber 100 feet in length. In this size an exhaust wheel draft is used. It is capable of being reduced in a few minutes to any desirable smaller size, and is therefore adaptable to any emergency as to capacity and use of fuel. When reduced one-half, or less than the normal size, a natural draft is used. The draft is reversible or respirating, passing a part of the time in one direction and a part of the time in the opposite direction, at the will of the operator, as occasion may require. By this operation every individual piece of the fruit or material to be dried, and every side of such piece is exposed to the direct action of the hot air current, and the process of curing, as the term applies, to hay, hops, raisins, tobacco, fish, meats, etc., by this operation, may be readily accomplished. As only a brief description can be given here in connection with Figs. 1 and 2, it may be simply stated that the heating apparatus of the drier is situated underneath the drying chamber, separated by a sheet-iron floor, the walls of the heating chamber being constructed so as to reflect the heat upward, and do not in any perceptible degree absorb heat. The sheet-iron floor radiates whatever heat it receives directly into the drying chamber, but the hot-iron current passing swiftly over the heaters and along the flues, carries with it practically all the heat generated by the heaters. The radiators in the drying chamber are closely connected with the heaters, and are so arranged as to make the heaters or the radiators radiate more or less heat, as may be required. The heaters, it will be seen, also have a reversible draft, which is made to correspond with the direction of the flow of the air current in the drying chamber.

In Fig. 1, on line A A, is the drying chamber, divided into spaces for the cars. Two of these spaces show the position of the cars loaded with trays standing within the drying chamber. This is a rear view of the chamber. The cars are moved in and out through apertures on the opposite side (as shown in Fig. 2). On line B B is the heating chamber. The space on line C C shows the exhaust passages connecting with the exhaust chamber at M, where the exhaust is made artificially through the wheel or naturally through the tower E, as may be required. The smoke-return flues, F, F, also terminate in a common upright flue or smokestack, G. In the tower within the smokestack is an exhaust steam pipe, H, used to accelerate the draft in the smokestack and tower when a natural draft only is employed.

On line I, I, is the sheet-iron floor before mentioned. The top of the tower, J, is so constructed that a slight breeze assists the natural draft, and in any case prevents the wind from blowing downward into the smokestack or tower. The radiators are located at K, K, in spaces between the cars at required intervals, and are used to reinforce the hot-air current as fast as it tends to decline. Two of these only are used at a time, the middle one and the one nearest the incoming draft, while the one nearest the outgoing draft is disused. It is not desirable, for obvious reasons, to add heat to the current after it passes the middle of the chamber. Compensation to that part of the chamber is rendered by reversing the draft. The gates for changing the draft are not here referred to by letter, as it will be readily seen that when the draft is

changed, the gates now open will be closed, and those now closed will then be open. The position of the dampers in the connecting flues will also be changed accordingly. The arrows show which way the draft is going at this instant; when the draft is reversed the arrows will all point in the opposite direction.

The heaters, L, L, L, are arranged in pairs, and are from 6 to 10 feet in length by 2 feet in diameter. They are provided with adjustable partitions, so as to cause a greater or less amount of heat to radiate directly or to pass into the radiators. Perfect control of heat is secured in this manner. The engine boiler is placed in the heating chamber beside the heaters, and the boiler flue is connected directly with the middle radiator. Thus it will be seen that every particle of heat generated is utilized.

Fig. 2 shows a sketch of the cross section of the building and its parts. In this figure A represents a side view of the radiator extending across the chamber; B a tray-laden car, drawn out to show position of radiator; C shows a side view of one of the heaters or of the boiler in the heating chamber and its connection with the radiator; M shows rim view of exhaust wheel; N the engine standing on the ground under the fuel shed, which extends the whole length of the building. The belt pulley and shaft of wheel is also shown over head. The lines P and Q represent the doors regulating the draft artificially through the wheel or naturally through the tower. Their manipulation will be easily understood. O is the receiving room for fruit, extending the whole length of the building. On the floor is a track running lengthwise of the building, on which are run supply cars to supply and relieve the cars in the dryer. There are no doors to the openings in the drying chamber, the cars being provided with the ends boarded up, forming shutters at each end, so that when the car stands within or without the chamber the aperture is always closed. The top, bottom and sides of the car are also enclosed by a simple apparatus, so that no matter in what position the car stands, cold air cannot be drawn into the chamber while the car is passing in or out. The cars, no matter how heavily laden, are moved either way readily by one person.

Modifications of the drier, as here represented, ranging from a capacity of 300 to 2500 trays, and costing for the apparatus from \$400 to \$4500, according to size and the quality of trays used. With the best galvanized wire screen trays 3 feet square, engine, wheel, boiler, cars, heater, radiators, flues, and all other apparatus, exclusive of building and labor, putting in apparatus, but including superintendence, a drier of the above description would cost about the latter sum, or with wooden trays about \$2800. The main requirements of the building are a good foundation, good floor and roof. Notwithstanding the fact that this drier, or most of its important improvements, have been and are being patented, the cost of the same is not materially enhanced thereby. Another fact should be well considered, the purchaser not being subject to the cost of experimenting and probable loss by so doing, is perfectly safe in contracting for the purchase of one of these driers, as the proprietor guarantees its proper working, and is responsible for all he contracts to do. For further particulars apply to

A. J. HATCH, 120 Sutter Street, San Francisco, Cal.

TWENTY-PAGE EDITION.

Vol. XXXV.—No. 24.

SAN FRANCISCO, SATURDAY, JUNE 16, 1888.

\$3 a Year, in Advance.
SINGLE COPIES, 10 CTS.

Orange Varieties Popular in California.

B. M. Lelong, Secretary of the State Board of Horticulture, has done a very creditable and timely piece of work in the preparation of a treatise on citrus culture in California, with a description of the best varieties grown in the State and varieties grown in other States and foreign countries; also practical suggestions on gathering, packing, curing, pruning, budding of citrus fruits and fruit trees, with account of diseases, etc. To have this information in the form of a public document is very desirable, now that there is such wide interest in the growth of citrus fruit trees in different parts of the State. Mr. Lelong has been among orange trees all his life, and is practically familiar with the subject which he expounds.

Mr. Lelong's treatise enables us to present on this page outline engravings of orange varieties which he deems the best grown in this State. At the head of the list, of course, is the Washington or Riverside Navel, or as the Government pomologists propose to call it, the Bahia. Mr. Lelong's book has for its frontis-

shows. Col. J. R. Dobbins of St. Gabriel, and J. W. Wolfskill of Los Angeles are mentioned by Mr. Lelong as leading growers of this variety.

Fig. 2 is the Maltese Blood, a popular variety. The fruit is small to medium; oval and

skin, and being very uniform in size packs well. It ripens late, and keeps well on the trees as late as August in Southern California. It does not drop at maturity. The tree is of dwarf habit, medium thorny, a good bearer and very desirable. It is a great favorite in the San

St. Michael. Those commended for trial are Jaffa, Majorca, Hart's Tardiff, Parson Brown, White Orange, and King Orange. Foreign varieties which have been tried here and are not recommended are as follows: Australian Navel, Homosassa, Large St. Michael, Small St. Michael, Duroi, and a number of others less known than these. He gives a full list of Japanese oranges but commends these: Tangerine or kid glove, Satsuma (Unshiu) and Kinquat (*Citrus Japonica*).

Varieties of California origin, besides Wolfskill's Best, which are commended, are as follows: Mayberry's Premier, Baldwin's Favorite, Wilson's Best, Konah, Cooper's Seedling and Kercheval's Queen. Of California varieties not recommended are the following: Nicaraguan, Tahiti, I X L, Wolfskill's Eureka.

To other parts of Mr. Lelong's treatise we will refer at another time. Residents of the State can obtain copies as soon as the supply comes from the State printer, by sending four cents to pay postage to B. M. Lelong, 220 Sutter street, S. F. In sending applica-

FIG. 3.—Mediterranean Sweet.

FIG. 4.—Paper-rind St. Michael.

FIG. 1.—Valencia Late.

FIG. 5.—Wolfskill's Best.

FIG. 2.—Maltese Blood.

A FEW OF THE BEST VARIETIES OF ORANGES GROWN IN CALIFORNIA.

piece the colored plate of this variety, which Prof. Van Deman used in his report as U. S. Pomologist in 1886. This variety is so generally known in this State that we need not attempt renewed illustration of it at this time. Other varieties shown on this page are less known but are of great value and worthy the attention of planters.

Fig. 1 is the Valencia Late orange which Mr. Lelong says has fruited for six years in this State, and is one of the best varieties grown. The trees do not begin to bear as soon as some other budded sorts, which is much in its favor, as most budded foreign varieties bear too soon and thus check the attainment of proper size by the tree. The orange is also very late in ripening, so that it can be shipped after other varieties are gone. The Valencia Late resembles the Paper-skin St. Michael in color and firmness, but is oblong and larger, as the engraving

has fine texture and flavor. The pulp is streaked and mottled with red. It has few seeds. The tree is thornless and of dwarf habit, and may be planted closer than freer growing kinds. Mr. A. B. Chapman of San Gabriel is the largest grower of Maltese Blood, and he regards it as one of the best varieties he has. His shipments to Eastern markets have brought large returns.

Fig. 3 is the famous Mediterranean Sweet. The fruit is medium to large, pulp and skin of fine texture, very solid and few seeds; ripens late, often not until May or June. The tree is thornless and of dwarf habit of growth and is inclined to overbear. It is perhaps the most widely distributed variety in the State, next to the Washington Navel. It was introduced and named by T. A. Garey of Los Angeles.

Fig. 4 is the Paper-rind St. Michael; fruit small, round, very firm and very juicy; pale thin

Francisco market. Fig. 5 is a California seedling, Wolfskill's Best, which Mr. Lelong places first in his list of desirable California seedlings. It originated with J. W. Wolfskill of Los Angeles. The original tree now stands over 30 feet high and is as large as any seedling of its age and shows the variety to be a good grower. The original tree is not very thorny. The fruit is of excellent quality, somewhat flattened, deep orange red, fine grain and pulp. The tree is a good bearer, and the fruit ripens early and should be picked before May. It is the earliest in ripening of all other native varieties. It has been widely distributed throughout the orange districts of the South.

Mr. Lelong's list of varieties of citrus fruits is probably the fullest in the English language. Besides the kinds already mentioned he commends the Rio, Asher's Best and the Azorean

tions, care should be taken to write names and post-offices plainly.

In his introductory to the work, Secretary Lelong says: "We may safely say that in this State, citrus culture is yet in its infancy, and we look hopefully to its promising future. Only in the past few years did we know what were the best varieties to grow, such as would be profitable, and would bear transportation, manner of packing, curing, etc., but through energy, persistency and hard work we have accomplished that end, and to the world we have made known the quality of our fruits; which cannot be surpassed. The awarding of gold medals to California at the New Orleans World's Fair for the best 20 varieties against the world, is conclusive evidence of this fact."

The orange interest of California is advancing. The outlook for the next crop at the South is said to be very promising.

THE VETERINARIAN.

The Functions of the Stomach in Ruminants.

(Concluded from Issue of June 2d.)

EDITORS PRESS:—The intestines of the ruminant are not so large as in the horse, but considerably longer. I will now, imperfectly I fear, but as well as I am able, endeavor to explain the physiology of the structure I have been attempting to describe. The food having passed down the esophagus, comes in contact with the two muscular pillars which are immediately over the left sac of the rumen, and, either by instinctive influence or by mechanical force, the pellet being hard and the muscles of the gullet strong, these pillars are forced open and the food falls into the left sac of the rumen. The food is then, by the contraction of the muscular coat of the rumen, propelled through its different compartments, becoming mixed with the fluid which is there secreted, and also with that that has been swallowed and entered into the rumen. It is macerated and prepared for another process.

The animal takes a deep inspiration. The diaphragm becomes tense and presses upon the rumen and reticulum anteriorly. The abdominal muscles contract and lend their aid posteriorly. The stomachs themselves also act powerfully and contract upon their contents, and a portion of food (which had been previously forced out of the rumen, and through the valvular fold, and into the reticulum, and had there become enveloped in mucus, and formed into a pellet) is pressed through the muscular pillars into the esophagus, while at the same time another portion is forced through the valvular fold from the rumen, and is ready to enter the reticulum as soon as it has become released. By the contractile action of the spiral muscle of the esophagus this pellet is conveyed into the mouth where it is remasticated and prepared for digestion.

Here I cannot but allude to the beautiful design of nature, as manifested in the structure and functions of the rumen. I should have mentioned before that no change takes place in the food during its stay in the rumen except maceration, accomplished by the warmth and moisture in which it lay, and the alkaline principle that was developed, and hence that it was necessary that it should remain there some time in order to undergo that process. How has nature provided for this?

The food passes first into the left sac of the rumen, and is thence propelled into the right which is inferiorly situated. How is it to be raised thence again? What power can throw the food from the lower into the upper stomach? The right sac is always full, rumination going no farther than emptying the left sac. There is always plenty of food macerating there, and although no power would be able to throw the food from the lower into the upper stomach, yet, when the upper one is filled as well as the lower, we can easily imagine that the muscles of the rumen are sufficiently strong to cause the food to revolve through the different compartments; and so that which had been long macerating will, in its revolution, pass into the upper stomach, and that which had been lately gathered and lay at first in the upper sac, will descend into the lower one, and the process of maceration will be constantly going forward, and no food will reascend to the mouth for a second mastication which had not been duly prepared. This has been proved by experiment. A sheep was kept without food for several days, and when killed the right sac of the rumen was found full.

Other experiments have proved that it is rarely that the food begins to be returned to be remasticated in less than 16 or 18 hours, and that the return is not perfectly accomplished in less than double that time. It is, therefore, not the food that has been just swallowed that the cow ruminates, but that which has been macerating in the lower sac of the rumen for 24 hours upon the average. The singular division of the rumen into these two compartments renders it impossible for rumination to commence before both sacs are tolerably full, and as certainly stops it when the upper sac begins to be empty, and thus secures the perfection of the maceration, and the more easy grinding down of the food under the teeth, and the subsequent extraction of all the nutritive matter.

But during all this time the food will undergo, to a considerable extent, the process of fermentation, and in that process much acid will be eliminated, and this will become a source of great irritation and annoyance. How beautiful is nature's contrivance to prevent this, and even to extract good out of evil. The fluid which is secreted by the rumen consists chiefly of an alkaline principle. This, previous to the commencement of the fermentation, combines with and dissolves certain portions of the vegetable matter contained in the stomach. It is an active and beneficial solvent. When the acid produce of fermentation begins to accumulate, it performs another office—it combines with it and converts it into a neutral salt, and that neutral salt, once formed, is useful. It stimulates the muscular fibers of the coats of the stomach, and increases their action in hurrying the food along, in order to be discharged

from the stomach. So admirable are nature's ways.

The food is remasticated, and returned again to the esophagus; and now, either from some instinctive influence, or owing to its having assumed a more pulpy consistence, it no longer forces open the muscular pillars, but passes forward into the maniplus. The semi-fluid portion goes farther; it runs on immediately into the abomasum, while the parts that have not yielded to the macerative power of the rumen, or that have escaped the action of the grinders, are caught up between the folds of the maniplus, and by the united action of the muscular fibers of the leaves, and the hard prominences with which the cuticle covering the leaves is beset, they at length become perfectly comminuted, and then, having been reduced to a pulpy mass, they are allowed to pass into the fourth stomach.

Here it is that the food meets with the gastric juice secreted from the villous coat, and by which it is dissolved and reduced to one homogeneous mass, called chyme. It then passes through the pylorus into the first bowel (duodenum), where it meets with the biliary and pancreatic fluids, and by their influence, and some other power, the clymous mass is separated into the chyle or nutritive part and the feculent or innutritive part. The chyle is absorbed by the lacteals and conveyed by means of the thoracic duct into the system; the feculent matter passes through the intestines and is voided.

DR. A. E. BUZARD, M. R. C. V. S. L.
No. 11 Seventh St., S. F.

Dehorning Cattle.

EDITORS PRESS:—In answer to a subscriber, amputation of the horns in cattle is not only necessary in cases of fractures, but in disease, faulty direction, deformity. Amputation is also resorted to to allow of the escape of collections of matter in the frontal sinuses (the sinus being continued into the core of the horn), which would be impossible for it to escape through the nostrils or to remove the larvae of the *cestrus bovis*.

It has also now become the fashion to quite an extent to render horned cattle "polled" by removing their horns when young—say about two or three months old, as it is believed that animals deprived of their horns yield more milk and flesh.

Amputation is performed on calves at the age of two or three months. The rudimentary horns being removed, with the view of increasing the milk and flesh-producing qualities of the animals.

Operation.

It must be understood that the horn of the young animal is mainly secreted from the band which surrounds the base; when the band is destroyed the appendage does not grow again.

In operating an ordinary gouge will be sufficient, but an old-fashioned gun-wad punch is very convenient; it must be sharp and fastened in a handle; the circular opening of the instrument should be large enough to surround the base of the horn.

Clip the hair off around the little prominence which marks the site of the young horn; then throw the calf on its side and have him held by two assistants. The operator, with the left hand resting on the head, passes the instrument perpendicularly over the horn, and, pressing strongly and in a slight rotatory manner, cuts through the soft tissues to the frontal bone, completely isolating the little horn. The hand is then depressed until the instrument is more or less horizontal, and the portion is gouged out. The wound is sponged; then apply a styptic, such as sulphate of copper, turpentine, alum, sulphate of zinc, etc., or suppress the hemorrhage by the actual cautery (hot iron). Remove the other horn in the same manner. No further treatment is necessary.

THE PUBLIC LANDS.

Government Surveys of Public Lands.

EDITORS PRESS:—As considerable has been said about the necessity for additional surveys of the public lands of California, I wish to give a few details of some of the old surveys.

The surveys made in this county 20 or 30 years ago range from poor and very poor down to scandalous. They were made by the mile and accepted without examination. Many lines were never run except on paper, and nearly all those actually made are inaccurate in direction and in length, and, worst of all, the corners are entirely lacking in many (probably one half the cases) and in the others very poorly and slightly marked. For instance, I'll take half dozen sections in corner of T. 31 N., R. 2 E., M. D. M. The lines vary about five degrees in direction from that given; one certain mile is 60 rods too long; a certain distance given at 35½ chains is 40½; another given 28 is 30; another at 60 is 80, and so on. The township does not match with the next one south by three-fourths of a mile, and on the west side of township there are no corners at all, so far as known.

In one place the original field-notes say two certain corners are 154 to 157 links apart; in another place they say they are together. In

many cases field-notes say that corner posts were marked by pits or trenches according to law. In every case this is believed to be false, as a pit or trench has never yet been found as far as known.

In lieu of the witness trees and other marks required by law, what do we find? Frequently nothing; sometimes a half-rotten small pine stick, sometimes with a small rock or two laid by it; sometimes a good witness tree properly marked; sometimes a simple blaze on the tree without any mark whatever; sometimes the marks made in the outside bark; in one case a letter T on the bark is all that identifies a corner.

Now remember that all these instances are in a few sections in one township. There is no provision in law whereby these lost corners can be restored. One surveyor may make a corner with great care, and next week somebody else makes another one elsewhere. Any man who has a wish to know whether he is living on his own land, must go to a heavy expense and survey sometimes for miles around to get anything like an approximate idea of his lines. Sometimes the whole value of a place depends on a spring, and a few feet would locate it on one or another section. I know several sections that have only one known corner, and one case where it will require 13 miles of surveying through heavy timber and shrub to locate one corner. Don't you think, Mr. Editor, it would be a good idea for the Government to do some of this surveying over again?

The U. S. has \$600,000,000 stacked up, and some people at Washington can't sleep for planning new ways of getting rid of it. Yet, when a few dollars are really needed, they can't be had. In the matter in hand the rule should be better and sufficient pay and better work. The Land Office at Washington sets the price of surveying at \$5 for section lines. It probably never occurred to the officials that there are a few trees on some of our California lands. In these mountains it requires hard work to average two miles a day with six men to help. In one case over three hours cutting were required on one quarter of a mile. In the heavily wooded hills section lines cannot be run properly for less than \$9 to \$10 per mile.

HORTICULTURE.

Fruit Specimens for the Government Pomologist.

Those who have new fruits which they desired tested by the Government pomologist, Prof. H. E. Vandeman, will be interested in the following directions for selecting, preparing and sending specimens, which we have just received from the Commissioner of Agriculture.

It is essential that all specimens of fruits sent to this department to be examined by the pomologist, and intended to represent certain varieties, should be characteristic in all respects and should fully and fairly exemplify their peculiarities. To this end the following instructions should be followed:

1st. Select such as are of average size, typical in shape and color, and not too soft to carry safely.

2d. Cut a small branch showing bearing wood, and if possible with one or more fruits and characteristic leaves attached, and when possible another showing the mature one-year-old wood. It is of the utmost importance, not only to the pomologist in identifying and comparing varieties, but also to the artist in making illustrations, that the branches and leaves should accompany the fruit.

3d. Each fruit, whether attached to a branch or not, should be separately wrapped in several folds of tissue paper, and then packed in moss, cotton or very soft papers, to fill the space between the fruit and the box which contains them.

4th. In sending such as are liable to shrivel, or such as have fresh leaves attached, the packing should be dampened. The box should be wrapped in several folds of strong paper, and securely tied over all with twine. There is no objection to sealing a package sent under a Government frank.

Great care should be used to send nothing by mail that may decay and injure the contents of the mail-bags. There is no objection to receiving overgrown or curiously marked specimens of fruits which are of special interest. Boxes made especially for carrying pomological specimens by mail, and franks for pasting on the outside of such packages, will be sent to any one applying for the same. When a frank of this department is used, no postage is required, and such packages may be mailed at any post-office within the United States. Large boxes or barrels may be sent by express and the charges guaranteed, which will be paid here.

NORMAN J. COLMAN, Commissioner.

H. E. VANDEMAN, Pomologist.

Fruit Packages.

[An essay by GILBERT TOMPKINS, San Leandro, read at the Santa Rosa Fruit-Growers' Convention.]

There has been no material change in boxes or crates this past season. As a general rule, they have been made according to the sizes declared standard at the Fruit Union meeting in January, 1887. The quality has been above the average, but on account of high quotations for lumber the price has been somewhat higher than heretofore.

The weights that the different sized boxes will

hold are overstated in the schedule in several instances. The weights given are supposed to be net; they really represent the gross weight. The four-inch plum-box is put down as holding 20 pounds of fruit—16 would be nearer the truth. The apricot and peach-boxes fall short in about the same ratio, although the way in which a box is packed is an important factor in counting the loss. The cherry-box comes nearer the mark than any, often holding more than the 10 pounds given it by the schedule. The sides composed of two strips were little used, the main objection being the extra work in putting them on the box, although some report that the fruit carried best in boxes of this pattern.

In nailing boxes together wire nails have been largely used, and are much better than the cut nails, splitting the wood less and holding better. The price per pound is about 50 per cent more than for the common nails, but there are so many more wire nails in a pound than there are of the clamsier cut nails, that the difference is more than made up by the better work of the wire nails.

So much for the packages—custom and practice have shaped them somewhat as we want them. If as much could be said of the manner of packing, the fruit business would be better for it. The average box is very badly packed. In some cases the fruit about half fills the box. Even where the box is well filled, the difference between the top and bottom fruit is something awful. Good fruit at the surface, rubbish underneath; not only in boxes packed for the local trade, but actually in the large boxes of fruit sent in loose, where it is the simplest matter in the world for a buyer to move aside the three or four respectable uppermost specimens and lay bare the rubbish of the lower levels, which does not put him in a good humor with the fruit or with the man who sends it.

A limited but painful experience in buying fruit in the San Francisco market gave the writer some idea of the importance of uniformity and honesty in packing fruit. A buyer soon finds out where he gets and where he does not get what he pays for. Of course there are times when the best of fruit will hardly pay for its boxes and freight, but at such times poor fruit is dumped, although good fruit at least does not leave a man in debt.

It is undoubtedly a hard undertaking to build up a reputation for honest work. Your men have been brought up on the other plan, and it is no small matter to get them out of their old habits. The picking season is always a rushing one, and skill-d help is invariably scarce, consequently it is the easiest thing in the world for careless ways to creep in the packing-house. Right here is where better and more attractive work must be done. Perseverance in well-doing is as needful here as in all other walks of life.

Fruit in bright, clean boxes will almost always sell at an advance over fruit of the same grade put up in rough or soiled packages. Layers of paper on the top and bottom of the boxes almost entirely prevent bruising and add greatly to the looks of the article. I am not sure but that it would pay with a fine grade of fruit to wrap each piece in the way it is done for eastern shipment. Put up in this way it will keep in good condition much longer than when packed loose, and consequently is in demand for shipping to interior points that are out of the fruit belts, and especially to points on the northern coast. Any one shipping fruit put up in this way should, if possible, get it to the San Francisco market on the day before the Oregon steamers sail. These steamers leave two or three times a week and frequently take large quantities of choice fruit. All the San Francisco papers give the sailing days.

It is impossible to give anything more than the most general directions for packing fruit in an article of this sort. If you wish to see packing as a fine art, go to some point where men who understand the business are packing for eastern shipment; watch their packers closely and try it yourself on the spot. Don't leave until you fully understand the wrapping and placing the fruit and can do it with reasonable neatness and speed. If you are within a day's journey of Sacramento, go and see how W. R. Strong & Co. do it. You will be well repaid for your journey.

WARPING OF WOOD.—It is said that the wood on the north side of a tree will not warp as much as that from the south side, and that if trees are sawn in planes that run east and west, as the tree stood, it will warp less than if cut in the opposite direction. However this may be, it is certain that the tendency to warp when sawn into boards is much greater in green than in dry wood, and that the convex side of the curve is always toward the heart. This warping, due to unequal shrinkage, and to the more open texture of the external portion of the tree, is not found to occur in the middle plank or board of the log, excepting as it may, in slight degree, reduce the breadth. This quality of not warping, which is in many cases absolutely indispensable for certain uses, as, for example, in the sounding boards of pianos, is secured in the case of spruce timber by first quartering the logs, and then sawing them with the angle downward. It is then sawed into boards very nearly at right angles with the line of annual growth, and a small triangular strip must be taken off to make the board square edged, but qualities of stability and strength are secured that could not otherwise be had.—*Mechanical and Milling News.*

THE STABLE.

Horse Talk.

EDITORS PRESS:—Some time since in editorial comment on an article by Mr. Jewett of this place, you asked if I would not contribute an article on the horse for your paper. My time is very much taken up, but in answer to a similar request, I furnished some matter for our local paper, the Hanford Sentinel. One of these articles I inclose to you, and if you think it will be of interest to your readers, you can republish.—N. W. MOTHERAL, Hanford, Cal.

Time is money. A horse that can go ten miles an hour and carry his owner to his business is worth at least twice as much as a horse that can go only half this distance in the same time. One hour each day of a business-man's time within one year, would be hard to estimate. A horse that could do this work for 15 or 20 years is worth much more than a horse that could last only five years. A horse that could carry a light boy or draw a light sulky and do this work, would not be so valuable as a horse that could carry a heavy man or draw a heavy buggy. A horse is valuable just in proportion to the amount of service he can render. All men do not want to ride or drive, but their business requires heavy horses for draft. Hence there is a demand for all the various breeds of horses. As there are but few men who can keep separate horses for the saddle, for the road and for heavy work, there has been a great demand for the horse-of-all-work. It can be readily seen how fast horses have been sought after, and have brought high prices in the markets of the world. The demand has led to the development of speed in horses and this to racing, and as like begets like in Christian countries, even racing has been encouraged by the Government, notwithstanding its acknowledged demoralizing tendency, for the purpose of producing a superior breed of horses. The breeding of our best horses has largely been given into the hands of men who are rearing them for the turf. Lately speed has been sought for at the expense of everything else, and this is giving us fast horses unfit for anything but the speed-ring. When racehorses were required to run four miles and carry heavy weights, none but good serviceable horses could succeed. When trotting horses were required to trot long distances, and to carry a heavy man, or draw a heavy wagon, none but the very best horses could succeed. The horse called the Arabian, in English horse literature, was from Barbary, on the northern coast of Africa, and were called Barbs. Early in the sixteenth century those horses were imported into England and crossed upon the best horses of that day. These Barbs have always been classed with thoroughbreds, and a horse whose pedigree runs back to one of those Barbs, without a mixture of coarse blood, is considered a thoroughbred in England. The American racehorse is an English importation and is an improvement in some particulars over the English thoroughbred. Having been bred in England with great care for 300 or 400 years, and the Barbs from which he sprung claiming a pure pedigree running back to the age of Mohammed, the thoroughbred has peculiar traits fixed, and will be more likely than any other horse to transmit his action, staying qualities and great strength to his offspring. The trotting horse of America runs back to Messengers who was imported about 100 years ago. He was a thoroughbred. No one until recently seems to have doubted this, as Miller's Damsel, his daughter, the dam of American Eclipse, and others of notoriety have always been considered thoroughbreds. The same has been said of Lexington and Norfolk. The trotting action was possessed by Mambrino, the sire of Messenger; and Infidel, by Turk, after he was put in training for a racehorse, trotted 15 miles in an hour on a public road. This is where Messenger got the trot from which he transmitted to his offspring. There are many thoroughbreds who have the same trotting tendency. Prince, who beat Hero, the pacer, in a 10-mile race, making the last mile in 2:39, was by Woodpecker, out of a mare by Langford. He was first trained to run. Van Tramp, the half brother of Flying Dutchman, had to be whipped and spurred to get him out of a trot. A thoroughbred horse from a family with trotting action would, if the ordinary rules of breeding apply to trotting horses, be more likely to transmit the trot than any other breed. Gov. Stanford is trying this on mares by Hercules, Bonnie Scotland and Lexington with success, producing such horses as Ansel, Palo Alto and others. Hiram Woodruff, who handled the fastest trotters of his day, and whose opinion is worth a great deal among horsemen, delivers himself on this point, using the following language: "I do not mean to commit myself to any theory of breeding, but will point out the indisputable facts that he (meaning Messenger) was a thoroughbred stallion that got trotters of true action and bottom to stay all day, and that his sire had got plenty of them before him, they both being trained and successful running horses." I will give a few of the celebrated horses and mares to show the relation of the blood horse to the trotter. Lady Suffolk, granddaughter of Messenger on both sides; O'Blennis by Abdallah, who was a grandson of Messenger out of Arizona by a son of Messenger. Henry, a thoroughbred, who beat Eclipse in a four-mile race, could trot, according to his trainer, in three minutes, sired the dam of American Star. Trustee, by Imported Trustee, the great 20-

mile horse. Flora Temple by One-Eyed Hunter by Kentucky Hunter, a thoroughbred. Highland Maid who gave Flora Temple all she could do was by Saltram by Imported Whip out of a mare by Gray Messenger. George M. Patchen got by Cassius M. Clay, dam by a full brother of Trustee the 20 miler. Lady Thorn, by a great grandson of Messenger out of a mare a grand-daughter of American Eclipse and Sir Archy Goldsmith Maid by Alexanders Abdallah a grandson of Messenger dam by Abdallah. Enough of this sort of literature might be produced to make a volume, but suffice it to say that the staying trotting horses all have more or less thoroughbred in them. Men who talk

AGRICULTURAL ENGINEER

Buck-Scrapers for Earthwork.

In the engineering features of the construction of ditches, levees, etc., in reclamation and irrigation enterprises in California, the question of the best method of moving masses of earth is a very important one. In a paper read before the Technical Society of the Pacific Coast by George J. Specht, he presented some very interesting notes on earthwork, relating

protect the land against the water flowing into the Sutter basin at periods of flood, which basin forms a large inland lake. The levees built in this section of the country are constructed usually with an outside slope of 3:1 or 4:1, and an inner slope of 1.5:1 or 2:1, and a top width of from 6 to 10 feet. The earth which is used to form the embankment is taken from both sides of the levee, and is put in place by means of scrapers.

The Sutter County Land Company's levee, as built at present, is 6' wide on top, with slopes of 3:1 on the inside, and 4:1 on the outside; its height varies from 6 feet to 14.5'. This type will probably be changed gradually to a 10' wide crest, with slopes 6:1 outside, and 2:1 inside.

In the construction of the levee just referred to, buck-scrapers and a few dump-scrapers were used. The buck-scrapers were 8 feet long and 23 inches wide, from outside to outside. The other dimensions can be seen in Sketch No. 1. Four horses are required to move one scraper. The driver stands on the end of the tail-board, pressing by his weight the edge of the scraper upon, and into the ground. This weight was not properly applied in the scrapers used, and two additional men were required to weight them down during the time of filling. The horses pulling ahead, earth accumulates in front of the scraper, and it is moved and deposited where required. To dump the earth, the driver steps off the tail-board, and the forward pull of the horses turns the scraper on its lower edge and empties it. The scraper then runs on its side-boards over the deposited earth to the other side of the levee and into the borrow pit. The side-boards are protected by flat iron $\frac{1}{2}$ inch thick. In the pit the driver takes hold of the tail-board, presses it down upon the ground and steps upon it, and again proceeds as above described.

A certain number of scrapers, varying according to the requirements, were worked in one gang, continuously moving from one side of the levee to the other, an operation by which the earth is well packed. The first load is taken near the foot of the slope, and the circuit enlarged with each trip until that particular section of the pit is scraped clean. In order that the work may proceed without interruption, it is absolutely necessary to have sufficient ground plowed ahead of the scraper gangs.

The capacity of one buck-scraper during the construction of the Sutter County Land Company's levee was as follows: Seventy thousand cubic yards were removed in 1277 scraper days, or one scraper moved per day about 55 cubic yards; 294 000 cubic yards were moved in 3249 scraper days, or one scraper moved per day 90.5 cubic yards.

The small capacity in the first case was due to the inexperience of the contractor, as well as of the teamsters, and to the fact that it was an old levee, partly finished the year before, which necessitated a higher pull. The total work done was 364,000 cubic yards, moved in 4526 days, or one scraper moved per day 80.5 cubic yards on an average. The cost varied from 9.63 to 11.4 cents per cubic yard.

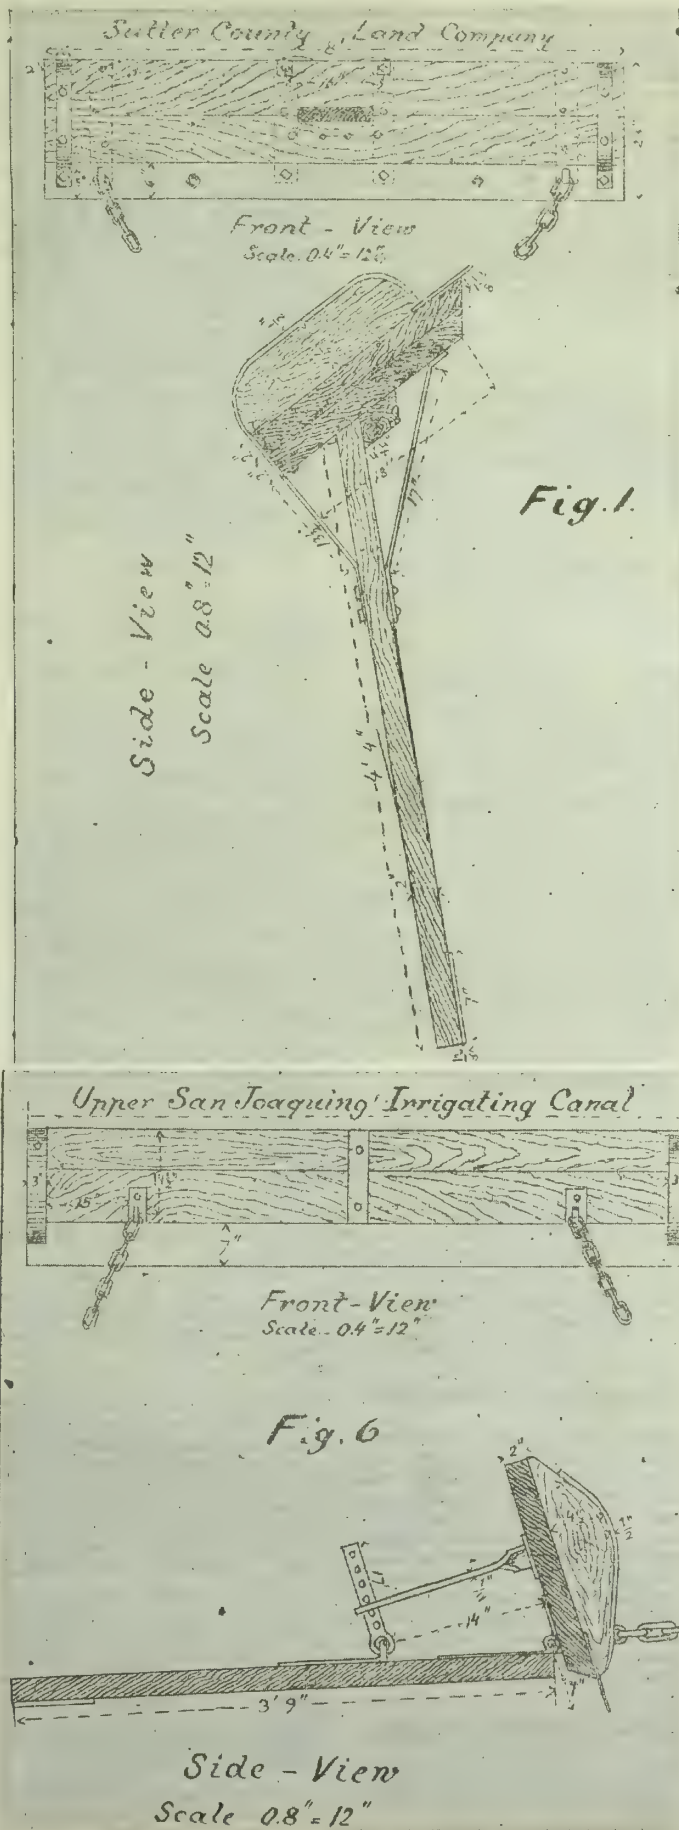

Mr. Specht in his paper gives a number of sketches showing sections of the levee. As, however, we only desire in this article to give some details of the work of the scrapers, we omit the sketches of the levees and canals and only give Figs. 1 and 6, showing the appliances referred to.

He gives in his paper a sketch of the scraper used at the Upper San Joaquin irrigating canal in Fresno county several years ago. The canal runs for several miles along a high bluff, which is apparently the shore of the old river channel. This bluff, which is composed of sediment, sand and hardpan, 2:1 to 1.5:1 for about 75 per of its length. There is no rock, and the hardpan occurs in strata of from a few inches to one foot in thickness, separated by quicksand. The hardpan is sufficiently solid to stand with a slope of 0.5:1, while the underlying sand rests only at 2:1 or 3:1. The work of excavation and building lateral embankments was done by buck-scrapers and dump-scrapers. The dimensions of the buck-scraper are shown in Fig. 6.

As all the loads had to be moved down hill, the work performed daily by one scraper was large. Observations showed that, with a total length of the round trip of 400' and a vertical distance of 40', in 9 actual working hours one scraper made 95 round trips, carrying at each 1.3 cubic yards. All the conditions were very favorable. This is the average of 1000 observations.

The maximum load observed was 1.64 cubic yards. Later observations of the same piece of work showed an average daily capacity of one scraper of 128 cubic yards. The daily expense of each buck-scraper was \$4 65. The average capacity of one scraper per day was 131 cubic yards.

ANOTHER survey is soon to be made by the Southern Pacific Company north from Los Angeles, it being the intention of the company to build a road which will be less expensive to operate than the present main line. The new line will leave the main track at a point about a mile south of the San Fernando tunnel, and will follow very closely the old emigrant wagon road through the Santa Susanna range. The passes through these mountains will be effected at the Canyon de Lacles, and the road will run through the mineral land district and out into the Santa Clara valley. The object of this route is to avoid the San Fernando tunnel and loop on Mount Tehachapi.

BUCK-SCRAPERS FOR EXCAVATING, ETC.

about the trotter being a distinct breed must remember that it takes more than "one swallow to make a summer."—N. W. M.

IRON IN MILK.—Dr. Lyon has been making an extended investigation of the amount of iron in milk, and finds that cow's milk contains more of this constituent than either human or asses' milk. In asses' milk he found .0025 per cent of iron; in human milk, .0015 per cent, and in cows' milk, .0040 per cent.

THE International Congress of Anthropology, the first ever held in America, began its session at Columbia college this week.

specially to the enterprise of the Sutter County Land Co., which owns several thousand acres of land in Sutter county, about 16 miles south of Marysville, 8 miles east of the Sacramento river and 6 miles west of the Feather river. This land occupies nearly the center of the Sutter basin, which plays a very important part in the drainage of the northern part of the State, serving during periods of flood as a relief basin to the Sacramento and Feather rivers, whose waters, owing to insufficient capacity of the river channels, are backed up from the lower end of the basin.

These levees are not exposed to the constant wash of a river current, their only service is to

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Unnecessary Expenses.

In a very timely address before Danville Grange, Hon. D. N. Sherburne considers the complaints that taxes are high and our State and county governments more costly than need be. Among other things, he says:

Our State Board of Equalization seems of little use. To be sure they assess the railroads, but what use in that when the railroad companies are above laws and pay no more taxes than they are a mind to? At first it was thought that the State Board could compel an equal and just assessment of all the property in the State. But the Supreme Court did not understand the Constitution as its creators did, and, by a decision in favor of the tax-shirkers, took away their powers in this respect. Therefore this board is but little use, only to draw their pay; Railroad Commissioners ditto.

We have a Surveyor-General's office that costs about \$10,000 per annum. Can any one tell what use we have for this office? The Constitution gives the Legislature power to abolish this office, and it should be abolished if found useless. Our Constitution does not provide for deputy State officers, but does provide that no clerk in any State office shall receive more than \$1600 per year. But the Legislature has got around the Constitution in this respect, by letting each officer have one deputy at \$2400 per annum.

The State and district agricultural societies cost \$104,000 for two years. This expense should be materially reduced or done away with. Then we have a military organization that costs \$251,000 for two years. This, in my mind, is a useless expense. We have no use for an organization of this kind, only for fuss and feathers; giving a lot of men a chance to play soldier—to parade and picnic at public expense.

Our last Legislature was extravagant beyond comparison; in fact, it boomed everything. The leaven infused by the members from the South leavened the whole loaf. They boomed the university to the extent of about \$20,000 more than was needed or asked for, and every other State expense about in proportion, and tried to boom the courts. But the voters stopped their wild career in that line.

This is only a sample of the way our money is spent. No wonder our taxes are oppressive. What can we do about it? We should work for reform and retrenchment; for just compensation for faithful and honest services in office; do away with all unnecessary clerkships and supernumeraries; send men to the Legislature pledged to reform and retrenchment—pledged not to party but to the people, and to keep out of Legislative caucuses where public expenditures are concerned.

The times call for reform. Then let us work in our respective parties to nominate reformers, and let it be known that such only can secure our votes.

Oldest Member.

EDITORS PRESS:—Sacramento Grange claims to have the oldest member on this coast; not only the oldest member but the most punctual, and who can render his work better and without the book than any member of his age in any Grange.

Bro. Davenport, our Chaplain for several years, who is 87 years old, does his work in the Grange readily without the book, a feat done but by a few of the young members. He is prompt in attendance and seldom absent from his post. He enjoys the reunion of other Granges, and is always ready when called upon to give his sentiments in a clear and business-like manner.

He has more hair on his head to-day than half of those that claim so much piety or show symptoms of vast stores of knowledge. Good wholesome work has never hurt him, and he attributes that as much as anything to his longevity.

He managed his farm until the last few years, when he sold out and moved to the city. He enters into the affairs of the Grange with an interest of a member of half his years. He is treated by the members with that fine sense of feeling that becometh a man of his years.

We feel proud to claim a member of his years, that we may have the benefit of his experience and council. I shall not attempt to write the biography of this brother, but if any one thinks they can equal it I will not make another attempt.

I have seen so many persons lauded to the skies and costly monuments erected to

their distinguished memories after they passed away, that I want to use a little of my influence to have some of these after-thoughts distributed to the living.

When a person has done a good work, act or deed, tell them so while living. Let them receive their earthly rewards on the earth, their spiritual in the spirit land. Monuments of brass and stone with high-sounding inscriptions are like the pardon that comes to the condemned after he is executed.

D. F.

From the Worthy Master.

Worthy Master Overhiser writes: Having received an invitation from Alhambra Grange to be with them on Saturday, June 16, and confer the fourth degree on a class and render the secret work, I have promised to be present on that occasion.

I have received an invitation, through Bro. Frisbie (which I now intend to accept, unless something beyond my control prevents), to attend the reunion of March Grange, on the 14th of July.

Last Thursday San Joaquin County Pomona Grange held its regular meeting. A communication was received from San Joaquin county Board of Trade requesting us to take charge of the exhibit at county and State fairs, which, after due consideration, we decided to do, providing the Board of Supervisors will appropriate a sufficient amount to cover the expenses of the fair, should we fail to draw enough from the State and county agricultural societies to meet all necessary expenses. As this is a county exhibit, we deem it right for the county to stand in and pay the difference.

A committee of three were appointed to wait upon the board, and, if a favorable response is given them, the committee will go to work at once and collect the products of the county for the exhibit.

Fourth of July Coming.

An additional question for June discussion has been added to the list, as will be seen in the Lecturer's desk. We believe that highly interesting Grange meetings can be held on the Fourth of July, or on the previous or following Saturdays, and therefore advise all Granges that can, to make due effort to duly observe this grand national holiday. Next week we shall publish the Farmer's Declaration of Independence, which may afford some opportune thoughts for expression (as the almanac says) about these days. In fact, it might not be amiss to read the entire document once a year in our Granges, or at open meetings and farmer's gatherings.—Patron.

Wheatland Grange.

MESSRS. EDITORS:—Wheatland Grange did not hold a picnic on the 1st inst., but they had a grand reunion or strawberry festival in their hall. The strawberries turned out to be raspberries, however, which all said were better. The day was cool and pleasant, and in due time our hall was well filled with our own members and their families, with a liberal supply of visitors from our neighboring Granges.

I. W. HUFFAKER, Sec.

State Grange Literary Exercises.

EDITOR PRESS:—The following named members have been appointed to act as Literary Committee at the next session of the State Grange: Bro. W. W. Greer, Sacramento Grange, Chairman; Sister A. T. Dewey, Temescal Grange; Sister M. B. Lynder, Alhambra Grange; Sister Wm. Johnston, Franklin Grange; Sister S. J. Cross, Roseville Grange; Sister A. P. Roache, Watsonville Grange; Sister C. E. Kinney, Temescal Grange; Sister E. W. Davis, Santa Rosa Grange; Bro. Norman Alling, Stockton Grange; Sister N. Alling, Stockton Grange. Wm. L. OVERHISER, W. M. C. S. G.

Questions for Subordinate Granges.

Free discussion of the following questions is invited by all subordinate Granges in California and Oregon, and it is requested that reports of the same be sent to the Grange organ, as well as for local publication.

JUNE 9TH.—How shall farmers celebrate and commemorate our American Independence?

JUNE 16TH.—What are the political duties of American voters at the present hour?

JUNE 23D.—Who will attend the State Grange at Tulare, and how shall we enjoy ourselves and aid to the interest of that occasion?

JUNE 30TH.—American patriotism and how to educate and imbue Young America with a true and lasting love of country.

The dates named for discussion can of course be varied according to circumstances.

IN Oregon, as in California, there is much life and activity in the Grange, as is evinced by the many accounts of picnics, county meetings, etc., as well as the extended reports of State Grange which appear in the Patron.

Here They Are Again.

The same old fraud, with a fresh coat of whitewash, turns up again this season in the rural districts. The smooth rascals have a special regard for you, and they want you to sign your name. They have been playing their game successfully in the neighborhood of Pomona, and the Progress tells how they do it, as follows:

A party of three middle-aged men, with smooth tongues and quick wits, are working a new fraud in this region, and it is well that the people should be posted concerning them. They claim to be agents for a large nursery concern, which they call the Central California Nursery Company, and which they claim is trying to introduce its new varieties of grape vines and fruit trees in Southern California. The "agents" method is this: They drive up to the home of a fruit-raiser, concerning whose financial standing and responsibility they have already quietly learned, and ask permission to send him, free of expense, next spring, a quantity of their new fruit trees, in order that he may try them and report the quality of fruit produced on them to the neighbors. When the fruit-raiser is given documents assuring him that he will surely have nothing to pay for the trees, he almost invariably jumps at the bait with uncommon avidity. Then the "agents" produce a blank, which they politely explain is merely to show the California Central Nursery that the trees and vines will be accepted, and in 9 cases out of 10 the paper is immediately signed by the intended victim. The "agents" drive away, and the fruit-raiser goes into the house to tell his family what a bonanza he has struck. A few days later his promissory note may turn up at the bank and his joy is turned to wrath. Look out for the scoundrels and pass them round.

Sacramento Grange.

EDITORS PRESS:—The last meeting of Sacramento Grange, No. 12, held on June 9th, was "Literary Day."

Worthy Master Holmes being absent, W. O. Bro. Jos. Sims called the Grange to order at two P. M. After the usual order of business was disposed of the Grange took a recess, and in open meeting was called to order by the Chairman of the day, Bro. Robert E. Greer.

After a few preliminary remarks by the chairman the following program was rendered: Song by the Grange; remarks by D. L. Bro. Geo. W. Hack; piano solo, Hattie Sims; reading Grange paper, edited by Mrs. W. W. Greer; song by the Grange; recitation, Flo M. Greenlaw; reading (original poem written by Mrs. Jos. Sims) Jos. Sims; piano solo, Gussie Wilcox; reading, Ida Flint; song by the Grange.

The Committee of Arrangements consisted of Bro. Robert E. Greer, chairman, Sister Carrie Holmes, secretary, and Sister Clara Hack.

At the close of the meeting remarks were made by W. L. S. G. Bro. Daniel Flint, Bros. Myron Smith and Chas. A. Hull, and Sister Jones of Yuba City.

Sacramento County Pomona Grange meets on June 30th. A full attendance is desired as business of importance will come before the meeting.

The order of Patrons of Husbandry in Sacramento county is in a flourishing condition; the subordinate Granges are in good trim and working order.

Under the efficient care of the present Worthy Masters and good guidance of our D. Lecturer, Bro. Hack, we hope to make rapid strides during the next year. Yours fraternally and sincerely, W. WALTER GREER.

STATE GRANGE MEETING.—The editor of the PRESS would be pleased to receive communications and fraternal suggestions concerning the next session of the State Grange at Tulare. We hope Patrons from Southern California and from all parts of the State and Oregon will give us hints and suggestions for the good of the Order in connection with the coming session, which we trust will be the largest and best ever held.

HENRY S. GRAVES of West Butte died of pneumonia on the 3d inst., aged 58 years. He was a pioneer of '49, one of the founders of the Sutter County Farmer, a leading Good Templar and an honored and beloved member of North Butte Grange, which has adopted resolutions of profound respect to his memory, and sympathy with his widow and children.

SAN JOSE GRANGE had co-operative institutions up for discussion again on the 2d instant. Among those who spoke upon the question were Bros. Feely, Saunders, Wingate and Dunn. The committee has sent to England for data regarding the Rochdale system, and the subject will be further considered at future meetings.

THE Worthy Master is having blanks printed for the use of Deputies and Granges, for the purpose of trying the inspection service in California which has proved so popular in the Granges of some of the Eastern States.

WASHINGTON GRANGE on the 9th unanimously decided to continue the payment of 20 cents per quarter per member until the next meeting of the State Grange. This Grange originally voted for the increase.

The New Overland Rates on Fruit.

The Transcontinental Association, through Chairman Leeds, has issued the following fruit circular: Rates on deciduous fruits taking effect June 14th:

In carloads of not less than 20,000 pounds, from fruit-shipping points on the California Central, California Southern and Pacific system of the Southern Pacific Company, to Denver, Pueblo, Omaha, Council Bluffs, Kansas City, Galveston, Houston and San Antonio, by freight train \$1.12½ per 100 pounds; by passenger train, \$2.25 per 100 pounds. To Chicago, St. Louis, New Orleans, St. Paul and Minneapolis, by freight train, \$1.25 per 100 pounds; by passenger train, \$2.50 per 100 pounds. To New York (Jersey City delivery) and Buffalo, by passenger train, \$3.12½. To Boston by passenger train, \$3.22½. To intermediate points, or points common with those named above, rates by freight train will be the same. The passenger train rates will apply only to points named or to points intermediate on the line by which the fruit is carried.

Parties shipping ten carloads of fruit to start at one time from Sacramento or other fruit points, can have same run in special trains, approximating passenger train speed, to Missouri river, Chicago or St. Louis. For this expedited service charge will be as follows, in addition to freight train rates as above:

To Omaha, Council Bluffs, Kansas City or intermediate Missouri river crossings, \$1275 per train of not over ten cars, each loaded not to exceed 22,000 pounds.

To Chicago, St. Louis or points common therewith, also to St. Paul and Minneapolis, \$1500 per train of ten cars, of 22,000 pounds each.

If more than ten cars are offered for a special train, by the same party, the charge in addition to the freight train rate for the extra cars, will be: To Omaha, Council Bluffs or Kansas City, \$85 per car of 22,000 pounds. To Chicago, St. Louis or other points common therewith, also to St. Paul and Minneapolis, \$100 per car of 22,000 pounds.

If a train expedited to the Missouri river contains from six to ten cars for Chicago or other points East, they will, at request of shippers, be run from Missouri river to Chicago as a special train, for which the additional charge will be \$225 in excess of the through rates to Chicago, as shown herein.

When special trains to Missouri river contain five cars or less, destined Chicago or other through point named above, each car so destined will be charged regular freight train rate if run east of the Missouri river, by freight train, or 18½ cents per 100 pounds additional, if by passenger train.

To New York City, approximate passenger train time, in trains of ten cars or over, five of which may be dropped at Chicago, \$2 per 100 pounds in excess of the rate charged to Chicago.

Rates named herein apply from fruit shipping points on the California Central Railway, California Southern Railroad and the Southern Pacific Co.'s Pacific System, but do not apply from points on the Vaca Valley and Clear Lake Railroad, Sacramento and Placerville Railroad or Northern Division of the Southern Pacific Railroad.

All charges on green fruit, whether by regular freight or passenger trains, must be prepared, or guaranteed by a good and sufficient bond.

All charges for special fast trains must be prepaid. Consigning the train to one party is for the purpose of collecting the expediting charge, which is a round sum for the special service. Each car will bear its own regular freight service charge and may be billed to a separate consignee.

The carriers will not run in special fast trains cars loaded in excess of 22,000 pounds; and reserve the right to determine the number of cars in excess of ten which may be taken in one train.

This special fast train arrangement is open to any corporation, person or persons, firm or firms acting in concert, who assemble on a given day at Sacramento or other shipping point, the requisite number of cars; but the expedited service will be treated as a unit, and no cars will be taken into a train without the consent of the party or parties acting together who have engaged and made up said train.

The rates named in this circular are guaranteed only on condition that the initial carrier shall determine the routing.

When ventilators, grates or doors are left open by or at request of shippers (which must be in writing and carefully filed by the agent) the carriers will not be responsible for damage or theft, and no claims for losses of this kind will be entertained.

The following dispatch, concerning the first auction sale of fruit, was received by the California Associated Press:

NEW YORK, June 13.—There were auctioned this morning 440 crates of California apricots at \$2.35@2.30; also 426 boxes California peaches at \$2.65@2.25. The lot was consigned to Dudley, Clapp & Doe.

6 P. M.—The agents of the California Fruit Union report concerning the first auction sale to-day of fruit consigned by the California Fruit Union that it was a success, some 200 buyers attended. The bidding was very lively. The peaches sold from \$2.65 to \$2.25 per box and apricots \$2.35 to \$2.30. Some of the peaches were a little soft, but on the whole the fruit was in prime order and promises well for future arrivals. One carload was sold in Boston to-day by auction, at equally good prices.

AGRICULTURAL NOTES.

CALIFORNIA.

Amador.

MONEY FOR THE PAVILION.—*Jackson Sentinel*, June 6: Judge Armstrong on Monday rendered a decision in favor of the legality of the order of the Board of Supervisors allowing the Directors of the Agricultural Association \$1000 for the erection of a pavilion. The decision was rendered on the ground that the appropriation on its face showed that it was made in good faith for the purpose stated, and that the question of good faith not having been raised by the pleadings there was nothing to show that the appropriation was not a legal one. The decision will give general satisfaction.

Butte.

CROPS PROMISING.—*Biggs Argus*, June 7: Ex-Supervisor J. S. Crain informs us that this year there is a better wheat crop than he has ever seen in this section of Butte county. Mr. Crain has raised 33 successive crops within a radius of five miles of Biggs, and always had a fair yield, but this year beats them all. Mrs. Mary Nantz has a 200-acre field of Patent Office wheat on her adobe farm about three miles west of Biggs that will make an enormous yield this year. Judge Crain handed us this week a bunch of long, full and plump heads which he plucked from the fields that show a fine prospect. M. B. Case, one of our most industrious and enterprising adobe farmers brought to our office this week several bunches of wheat which he pulled from various fields on his way to town. The heads were of the club and white varieties, and every mesh had from three to four grains. Mr. Case says there are thousands of acres of this class of wheat on the adobe and there are numerous fields that will harvest from 35 to 40 bushels to the acre.

NEW WHEAT.—*Chico Enterprise*, June 6: The first sample of new wheat of the season was brought to the office of Roper & McIntosh, the grain-buyers, to-day, and is a fine sample. The grain is from the ranch of Sam Morton, southwest of Nelson, grown on black land, and puts out about 25 bushels to the acre. Mr. Morton has 400 acres of this to harvest. Next week the harvest will be in full blast all over Butte county.

Colusa.

CENTRAL CANAL.—*Colusa Sun*, June 9: The directors of Central irrigation district held a meeting last Tuesday, and resolved to issue the bonds authorized by a vote of the people, and put \$100,000 of these bonds on the market at once. The secretary was instructed to get the lithography done and to insert the advertisement according to law for the sale of the bonds. Bids are to be opened on the 10th of July. The board will meet again next Monday, with Engineer Grunsky, and in all probability prepare to have the contract advertisement run parallel with that of the sale of bonds, so that work may be commenced by the 15th of July. It is then the intention of the board to push the work to a finish.

Contra Costa.

SHADE TREES AT ANTIOCH.—*Martinez Item*, June 6: The Ladies' Arbor Society holds its regular monthly meeting this evening. Great interest is still manifested in the society. The trees planted on the public roadway to the depot are growing finely.

ALMONDS.—Yesterday Jasper Jones brought in a specimen of soft-shell almonds grown on the ranch of his father, Nathaniel Jones, near Lafayette. Upon one limb about 18 inches long, in a space not longer than 10 inches, can be counted over 50 good-sized, thrifty almonds. The trees from which they were cut were planted eight years ago, and the land has never been irrigated.

Fresno.

FAIR DATE FIXED.—*Fresno Expositor*, June 6: At a meeting of the directors of Agricultural District No. 21, it was decided to hold a fair next fall, commencing September 25th and closing on the 28th. In the meantime the association proposes to erect a large pavilion at the fair grounds to accommodate exhibitors. A great speed program will also be arranged for the occasion. The time set for holding the fair is two days after the close of the Stockton fair.

Humboldt.

PRUNES AND WALNUTS.—*Rohnerville Herald*: On the Frame place, one mile east of town, Mr. Perrott, the present owner, has growing and well loaded with fruit 2500 prune trees of the favorite varieties. The trees are from three to four years old, and are as thrifty looking and prolific as any we have seen. The crop will be a valuable one. On the grounds of Judge Bryan in this place an English walnut tree, planted a few years ago as an experiment, is also loaded with nuts equal to any raised in this State.

Inyo.

READY FOR WATER.—*Independence In* dex, June 6: The Inyo Canal Company has seven miles of canal completed and is now ready to turn in the waters of Owens river in quantity sufficient for the irrigation of 5000 acres of land. A temporary headgate has been put in and will be used until such time as low water favors the building of a permanent gate. In the erection of the latter 11,000 feet of lumber will be required—a work of no small importance. Water will be turned

into the canal in a day or two, or as soon as the ditching machine is moved to the depot, to which point the canal is completed. Up to this time the canal has been used as a road, and as the machine will have to be moved in it, water cannot be turned in until it is moved.

Los Angeles.

HOMING PIGEONS.—*Los Angeles Times*, June 7: L. Thorne, living at 520 Los Angeles street, imported a pair of Antwerp carrier-pigeons about three years ago and began raising them. He now has quite a large flock, and lately has been giving them a trial. Last Saturday he flew 20 from Downey, and they made the trip home in 15 minutes. Monday 20 were sent off from Norwalk. One of them failed to get in, but the others made the trip in 17 minutes. From Orange 19 were started yesterday, and they arrived here in 1 hour and 30 minutes. They appear to have gotten lost or belated on the trip. A number of little missives were brought in by the birds.

Placer.

HANSELL RASPBERRY.—*Auburn Herald*, June 2: Under the skillful cultivation of Mr. A. S. Whitmore of Newcastle, the Hansell raspberry is gaining an extended reputation. This variety is a hardy grower and prolific bearer, but requires a rich soil for its highest development. It is an early and late bearer. The berries are not so large as those of some other varieties, but are firm and compact, weigh two pounds more to the case than other raspberries, and bear shipping better. They have been shipped as far east as Chicago, are good keepers and do not drip. Mr. Whitmore ships raspberries earlier than any one else, and consequently receives a higher price. This year he received \$4.50 a case for his best berries. Last Sunday he picked 83 cases, and will, according to report, receive over \$1500 for his crop this year. His raspberry patch is somewhere between an acre and an acre and a half in extent.

A FRAGRANT FREAK.—*Newcastle News*: Ed. B. Silva showed us a strawberry Monday that was a curiosity. It was a double berry, fully matured and ripe, having a perfect green leaf on each point. At first we thought the stem must run clear through the berry, but an examination showed that the berry was soft and natural all the way through. All the same, two perfect leaves had formed at the lower ends of the berry. What caused it?

Sacramento.

HEADING BARLEY.—*Galt Gazette*, June 9: John McFarland is entitled to the credit of doing the first heading of grain this season in this vicinity. He started his headers last Saturday to cut barley. His grain crop is excellent and will be fully up to an average.

San Benito.

MONTHLY HORSE MARKET.—*Hollister Free Lance*, June 8: The fifth monthly horse market, under the auspices of the Board of Trade, was held yesterday. There was a good attendance. Out of 103 horses registered, 85 were brought in and 18 were sold. Arrangements were also made for the sale of five others, to be consummated Monday. The principal purchasers were from San Francisco. The aggregate amount of money brought into the county by yesterday's sale will approximate \$2300. The monthly horse market is an established success. Ninety-one horses have been disposed of through this medium, bringing into the county not less than \$15,000, which has been distributed among our farmers at a time when it was most needed.

San Bernardino.

ORANGE CULTURE—DOES IT PAY?—The *Riverside Press* is considering this question and gathering facts to illustrate the real situation. H. E. Allatt, agent for the Russ Lumber Co. and one of the city trustees is thoroughly reliable. He has an orange orchard that covers 4.04 acres of land. He harvested this year his fourth crop and sold the same on the trees for \$2.05 per box. The variety of the oranges is not given but probably most of them were seedlings, or else he sold at a very low figure. His crop amounted to 1029 boxes, no account being taken of culls. The gross returns were \$2111, which gave him an average of \$522 per acre for his crop on the tree; and allowing the \$22 per acre for cultivation—hardly enough—he had 500 per acre net for his crop. The yield amounted to about 3½ boxes to the tree. Wm. Houlding this year picked 530 boxes of oranges from an acre and a half and sold the crop for \$1060—over \$700 an acre. Last year the place formerly owned by A. J. Twogood, but then and now the property of Mr. Hewitson, yielded \$6200 for six acres of orange orchard, and this was the net receipts as shown by the returns of C. E. Packard who marketed the crop.

San Diego.

CHERRY ORCHARD AT MESA GRANDE.—*Cor. Julian Sentinel*, June 8: After crossing a number of small streams on the Mesa Chiquita, the pioneer fruit ranch of J. E. Gedney is reached. He has every kind of fruit adapted to this climate, among which are several hundred cherry trees, all loaded to the ground with the ripening fruit. The ravages of the birds have often been urged as an objection to the cultivation of cherries in this country, but these are entirely unprotected, and Mr. Gedney says that what the birds take he does not miss. He sells his cherries for from 18 to 25 cents a pound, and as each tree has from 150 to 200 pounds of fruit (the trees are all quite young yet) it will be seen that it makes a very profitable crop. He selected for his orchard the driest, steepest and

rockiest looking land to be found on the whole mesa—enough to satisfy any one that there are thousands of acres in that vicinity that may be made as profitable, and the people are very zealous in their work in that direction.

San Joaquin.

BIG BLACKBERRIES.—*Stockton Independent*, June 6: H. R. Allen, who lives four miles north of Lockeford, has left at this office a branch from a blackberry bush that is loaded with luscious fruit, large, plump and delicious. The berry is of the variety known as the Early Harvard, and commenced ripening May 20th. It was grown without irrigation. The size of the fruit is equal to any ever seen.

San Luis Obispo.

AGRICULTURAL ASSOCIATION.—*S. L. O. Tribune*, June 8: At the meeting of the association held Saturday there were present Messrs. Warden, Orcutt, Leedham, Van Gorden, Murphy and Webster. The committee on pavilion reported through J. H. Orcutt that they had leased ground from the county at the nominal rental of \$1 per annum for 20 years. That they had endeavored to raise a sufficient sum to build a pavilion, but thus far had been only partially successful. Warden, Andrews, Orcutt, Steele and Jack were appointed a committee on pavilion, with full power to do anything requisite in the premises. Resolved, that Mr. Leedham be appointed the official representative of the county at the coming Mechanics' Institute Fair, and that we endeavor to secure by subscription the funds necessary to defray the expenses incident to the exhibit. Leedham, Webster and Orcutt were appointed a committee on premiums and pavilion. Resolved to hold meetings henceforth the first and third Saturdays in each month until after the fair.

Santa Barbara.

MUSTARD.—*Lompoc Record*, June 2: Within two weeks mustard harvest will begin on the Santa Rita rancho. The crop is not up to the yield in our best years, but the increased acreage will bring it up to the general output from this section. There is a worm working on the mustard that promises to do great damage. Some think it will destroy from one-fourth to one-third of the entire crop. The mustard louse is also at work more in some places than others. So of the worms. All crops are not affected alike. Two weeks more and we will be enabled to speak more definitely concerning the damage.

Santa Clara.

BUSY CANNERS.—*San Jose Times*, June 8: The Dawson cannery on the Alameda has put up so far, in round numbers, 6000 boxes of cherries, 2000 of currants and 1500 of gooseberries. The canning of currants and gooseberries will be completed within a few days. Of cherries the proprietors expect to can about 2000 boxes more, which will probably keep going the 200 persons now employed by them until apricots come on, after about two weeks. During July they will continue on apricots and also commence on blackberries, raspberries and peaches, and their force of employees will be increased to 300 or 400. Most of their work is paid by the piece, women making from \$1 to \$1.50 and men from \$1 to \$2.

Santa Cruz.

FROM THE BEET FIELDS.—*Pajaronian*, June 7: We continue to hear good reports of the excellent showing made in the appearance of the beet crop. Samples of beets brought to town show a vigorous growth, and point to the conclusion that a portion of the crop will be ready for harvesting before the factory is finished. An experimental sugar-beet farm is being conducted by Dr. Von Wachtel, on the Johnson place, near the factory, and he is having the thinning done by girls. He is well pleased with their work, and thinks he has the best lot of workers in the valley. He states that over half of the beet acreage of this valley has been thinned and cultivated, and that of the remaining part a considerable portion is not ready for thinning. As a large number of boys are honorably promoted from the schools last week, and hence were excused this week, farmers have found less difficulty in obtaining help for the battle with the rapidly growing beets. So far as we have heard, the boys, when superintended by the farmer or some other competent person, have given splendid satisfaction. The beet factory is paying out over \$2500 per week for labor. The weekly output of that amount of money, in addition to the usual circulation, is felt by traders in a town the size of Watsonville.

FLAX.—Through G. A. Trafton Mr. Hatfield, who visited this valley last fall to canvass its advantages for a flax-mill, distributed a quantity of flaxseed, most of which was planted by Nels Struve. The flax looks well, has made a fine growth, and has a fiber of remarkable strength. Samples of Struve's flax are displayed at the office of Hawkins & Peckham.

Sonoma.

PAYING POULTRY.—*Healdsburg Enterprise*, June 6: Dr. T. W. Brotherton of this place is quite extensively engaged in raising thoroughbred poultry. He has two Petaluma incubators of 70 eggs capacity constantly in use, and thus far has made this system very profitable, and attended with less care than allowing the hens to set. He has a flock of six black Spanish hens, which he claims to be the best laying fowls to be found, laying from four to six eggs per day the year round. The Doctor also has 40 Brown Leghorn hens which laid

during the months of January, 1116 eggs: January, 1303; March, 1205—a record which is hard to beat. The yard is situated on the sunny side of the slope near his home, and divided into small yards separated by wire fences. The doctor takes good care of his poultry, and thereby makes a success of the business.

Tulare.

EARLY ROSE POTATOES.—*Visalia Times*, June 7: Yesterday J. L. Morrow brought in from his ranch, 12 miles east of this city, a sample of what can be done in the line of large, mealy potatoes. From one vine he gathered 32 potatoes that weighed 14 pounds. Further, the vine was a volunteer product, growing in a field where potatoes were raised last season, and none were planted there this year. Still further, he has 25 acres of this volunteer crop, which he is now gathering, and it is yielding 150 sacks per acre, the yield of the 25 acres aggregating 3750 sacks. The entire crop has been sold to an Eastern gentleman, in the sacks on the ranch, for 75 cents per sack, bringing the sum of \$2812.50. The crop grew on unirrigated but moist land, such as is to be found along the bottoms of the Kaweah and St. John rivers. All the expense incurred was that of digging, which will amount to not more than \$25, or \$1 per acre. They are of the Early Rose variety and as large as those usually grown in this section. The purchaser will take advantage of the late low rates adopted by the railroads and ship them east to supply the demand there.

THE FRAZIER VALLEY IRRIGATION CO. will commence the construction of their ditch next week. The water will be taken out of Tule river at the old Johnny Campbell ranch and conducted through Frazier valley to the John Tuohy ranch on Lewis creek, a distance of 22 miles.

RABBIT-DRIVE AT PIXLEY.—*Tulare Register*: On Friday June 1st occurred the big rabbit-drive that has been advertised for the past month. People flocked to the scene from all directions. It is estimated that there were between 300 and 400 vehicles in line and between 2000 and 3000 persons of both sexes and all ages. It was a fine day for a drive, being cool and breezy. Like all other drives, however, proper caution was not observed in keeping the ranks closed on the wings, and, consequently, thousands of rabbits escaped before reaching the corral. With what were killed outside the trap, the number of dead rabbits would reach somewhere in the neighborhood of 5000.

Ventura.

LOTS OF 'COTS.—*Ventura Democrat*: There are within three miles of this town 1000 acres of apricot trees in a single locality, all bearing. This, we are informed by a gentleman, who claims to know whereof he speaks, is the largest body of bearing apricot trees in the world.

Yuba.

MARYSVILLE DOTS.—*Appeal*, June 8: Over 75 tons of wool have been shipped from this city to Boston within the past 10 days. The dairymen in this vicinity say that they have had good grazing for their stock on the highlands up to the present, and now the lowlands, which are looking fine, will be used. Ten tons of apricots were placed in the assorting room of the Marysville cannery Tuesday morning. The cannery opened yesterday with 155 employees, only seven of whom were Chinamen, and few white men could be obtained to do their work. Supt. Skinner last evening estimated that they had put up close on to 20,000 cans. From this on for two weeks they will consume from 10 to 15 tons of apricots, and after that more. Good grain hay was offered at \$10 per ton yesterday. The lively stables are laying in a good supply at that figure. Last year \$7 and \$8 was all they paid up to the corresponding date.

THE BROWN VALLEY IRRIGATIONISTS met there Monday morning, quite a large number of the foothill farmers being present and much enthusiasm being manifested over the decision of the Supreme Court of the Wright bill. Speeches were made by A. S. Wright and E. A. Forbes. The Executive Committee met and reports of subcommittees were received. A thorough survey and a complete and reliable report of the topography of the country will be made by Engineer Meek, together with estimates of probable cost. A practicable ditch route will be selected, and the eastern boundary of the proposed irrigation district will be run out. The engineer and his crew started for the initial point of operations, as agreed upon by the committees, the same being the Black Divide in Oat Hills, and work on the survey is now going on.

Yolo.

"SKYHIGH" APRICOTS IN NEW YORK.—*Winters Express*, June 2: Last week we mentioned a shipment of eight boxes of apricots to N. Y. made by Mr. G. W. Hincley of Skyhigh ranch. Mr. Hincley has since received the return of sales, which states that his fruit was the very first to arrive in the N. Y. market. The 'cots were packed in little cherry boxes and sold for \$5 a box, or 50 cents per pound. The expenses for transportation, etc., amounted to \$14.50, which leaves Mr. Hincley the neat sum of \$25.50 for eight cherry-boxes of apricots. The fruit arrived in good condition and sold readily at the price named. The apricots sent by Mr. Hincley were picked from the trees when thoroughly ripe, but before they had softened were carefully packed, and the result of the sale shows that it will pay to be careful.

Seeking Rest.

BY SAM BOOTH.

Coming one day to the portals
Where the angel sentries wait,
A pilgrim, old and weary,
Stood by the Golden Gate.
His feet were sore and bleeding,
For hard was the way he had trod,
And long, long years he had journeyed
Toward the city of our God.

With awe and reverent feeling
He raised his trembling hand,
To knock at the shining portal
That opened to the heavenly land.
When, spoke the great Archangel,
Who stood with a flaming sword,
"None enter here save those who come
In the name of Christ, our Lord."

Abashed stood the trembling pilgrim,
Then with faltering step and slow,
And with look full of infinite yearning,
Was turning away to go,
When lo! 'mid a throng celestial,
A glorious presence came,
While a burst of heavenly music
Rang out the one great name.

"Fling wide," said he, "the portals,
And let the wanderer in,
His soul by faith and suffering
Is purified from sin.
Come in, come in, poor pilgrim,
To thy home among the blest,
For he who hath helped my poor ones
Himself shall enjoy my rest."

San Francisco, May, 1888.

"Behind a Frowning Providence."

Gloriously bright rose the sun one June morning years ago. Long, warm rays shone across the spotless floor, and touched the rows of shining dishes on the dresser, in Mrs. Prime's cosy kitchen. The little maid who stood at the open window was thinking of something far less pleasant than the peaceful scene before her. Her cheeks were pale and her eyes swollen with weeping, as she stood there looking languidly out. Only yesterday she had thought herself the happiest girl in the world, when out there under the lilacs she had promised to be Robin Moore's wife. To day she was the most miserable, for she was accused of a crime and was about to lose her only means of support. Yes, she, Mollie Gowen, whose character had always been the best, was accused of theft by the employer whom she had served faithfully these four years.

It came about in this wise: The day before our story opens, Capt. Prime brought home thirty silver dollars and placed them away in the desk that stood in one corner of the keeping-room. Before doing so, however, he showed them to his wife and Molly, and allowed little Hittie to play with them awhile. In the afternoon he went to the neighboring village, leaving the desk unlocked, as he often did. It was sunset when he returned, and just as he entered the house he saw Molly come out of the keeping-room. She started and turned pale at sight of her master, who asked her with a smile:

"Did I frighten you, Molly?"

Molly laughed nervously as she replied, "Yes, sir, I did not hear you come in and you startled me."

The captain thought no more of the occurrence then, though it surprised him to see Miss Molly so nervous. Presently Mrs. Prime came in with Hittie in her arms. "Oh, it was your voice that woke me," she said to her husband, "I had one of my headaches this afternoon, and I think Hittie and I have slept nearly two hours."

In the evening after her work was done Molly came in, dressed for a walk, and asked permission to visit a friend who worked for a neighboring family. It was granted, and Molly started out, but had not gone far before she met Robin, and instead of visiting her friend she strolled down by the river with him.

Shortly after, the captain came in and went to the desk for something. On opening the drawer, he found that his money was not where he left it in the morning. He searched each drawer in turn, then called his wife. "Hannah, have you moved my money?"

"Why, no," responded Mrs. Prime, coming to the door and looking in. Again they searched the desk, but with the same result.

"Call Molly," said the captain. "She has gone over to Mr. Ford's to see Eunice," responded his wife.

"Has any one been here to-day?" "No, I asked Molly that question when I woke up, and she said she had not seen any one this afternoon."

"What was she doing in the keeping-room to day when I came home?"

Mrs. Prime looked surprised: "I did not know she was in there," she replied.

The captain then told his wife of Molly's confusion that afternoon.

"But, Ezra," she replied, "you surely don't suspect Molly? Why, I would as soon think of Hittie as of her!"

"What else can have become of the money?" he queried.

This was a problem that Mrs. Prime could not solve, so she remained silent.

Just then Molly came in looking flushed and tired from her rapid walk.

"Where have you been?" demanded the captain.

Molly looked confused. She was not used to being asked such a question, and the captain's manner was so stern it frightened her. She could not tell him about Robin, so she remained silent.

The captain's brow grew stern. If Molly had answered him frankly he would have believed her, but her silence strengthened his suspicions.

"Have you been to see Eunice?" he continued.

Molly hung her head and answered faintly, "No."

"What were you doing in the keeping-room this afternoon?"

There was such a lump in Molly's throat that she could not answer at first, but, after a moment, she said: "I went in to see if it needed dusting."

"It took you some time to make that answer," said the captain sarcastically. "It is of no use, Molly; you may as well tell me at once where my money is."

Molly turned pale and looked helplessly at him. Even Mrs. Prime's faith began to waver, and she said gently: "Tell him, dear. He won't be hard on you."

This was too much for the poor girl, who burst into tears and cried out vehemently: "I don't know anything about your money! What do you mean?"

"Come, come!" said the captain angrily, "this won't do, you see you are found out. I wouldn't have believed it of you! I would have trusted you anywhere! I suppose I ought to send you to jail; but I won't on your mother's account. If you will restore the money, I'll forgive you; but if you do not I shall send you home without your pay, and everybody shall know why, so that they may not get deceived in you as I have."

Poor Molly crept off to bed with a bursting heart, and wept through the long hours of the night. Not only the thoughts of her disgrace, which was terrible to the proud girl, kept her sleepless, but the thoughts of her mother and sister, who were dependant on her for support. How would they live now?

As Molly turned from the window, Mrs. Prime came in. Her motherly heart was filled with pity at the sight of the girl's pallid face, and taking her cold hand she said: "Keep up good courage, child, I believe in your innocence, and some time the money will be found, I am sure."

Tears sprang in Molly's eyes at the kind words. One at least believed in her and trusted her still. How the thought comforted her!

That night, when all her preparations were made for leaving, she took Hittie up to kiss her good-by. The child was very dear to Molly, who took a great deal of care of her; but Hittie struggled angrily, crying out: "Go 'way! Oo s'an' touch me! Oo's a bad, wicked girl, for my daddy says so!"

A hard, rebellious feeling crept into Molly's heart as she set the child down and took up her bundle. She found Mrs. Prime waiting for her in the hall and the gentle woman kissed her cheek and pressed something into her hand.

"Don't give up, Molly," she whispered, "remember I trust you." "God bless you for that!" said Molly fervently, as she turned away to hide the falling tears.

When she had reached the highway, she opened her hand and there lay two shining gold dollars, her month's wages. Somehow the little gold pieces warmed the girl's heart and assured her again that the whole world was not against her.

How merrily she had tripped along this road a week ago, singing as she went; but now she walked with lagging steps, dreading to tell the folks at home her trouble, yet longing for their sympathy. The air was filled with the melody of the birds, and the sound of distant water at the mill, but Molly heeded not the sweet sounds, nor

saw the blue hills penciled against the summer sky.

The great rose-bush beside her mother's door was flaming with red roses, and a light breeze scattered the petals all around her as she went up the path. Little Betty ran out to meet her, crying joyfully: "O, Molly, have you come home to make a visit? How glad I am!"

Molly could not answer, but taking her sister's hand in hers, she went into the room where her mother sat. What a feeling of comfort and rest her mother's presence gave the poor girl; she had one friend, at least, who would love and trust her, come what might.

Without a word she threw herself down at her mother's feet, and burying her face in her lap, burst into tears. Mrs. Gowen stroked her daughter's hair silently and waited for her to grow calmer. At length she told her story, much to her mother's indignation.

"Did they not know you better than that?" she asked. "You who have worked for them so long and so well! Don't be afraid, Molly! God is with the innocent and He will overrule this for your good, child. Behind a frowning providence, God hides a smiling face."

"And O, mother," continued Molly, "I was so happy before this happened, for I had promised Robin Moore to marry him; but now I never can unless that money is found, for people shan't say Robin has married a thief."

The news of Molly's disgrace spread like wild-fire. Those who envied her her pretty face and the marked preference which handsome Robin Moore showed her, pretended to believe her guilty, and treated her with coldness when they met, but the majority of her neighbors were very indignant, and pronounced Capt. Prime a "purse-proud old Pharisee." These sympathizing friends gave many proofs of their good-will, and helped Molly in every way they could.

"One thing I am learning, mother," she said with a sad smile, "and that is to know my friends."

The next evening after Molly's dismissal Robin came to see her, and was very bitter toward Captain Prime, whom Molly defended stanchly. "Circumstances were all against me," she said, "and it is no wonder he thought so. If ever the truth is known he will feel badly enough, for he is a just man."

Robin urged a speedy marriage, but Molly would not hear of it. "No," she replied, "I will never marry you till this is cleared." In vain he protested; she remained firm and he was forced to submit, vowing vengeance, however, when the truth would be known.

Dreadfully the weeks crept by and still Molly was without work. Day after day she sought employment, but the scandal outran her and she was looked on with suspicion. If any one did hire her for a day, she had the mortification of knowing she was watched. She kept all these things from her mother's knowledge; but they weighed on her proud spirit and she grew pale and thin. Their little hoard of money was all gone, and the meal was getting low, so poor Molly's reflections were gloomy enough as she sat by the window one afternoon knitting and watching the dusty road. Suddenly she dropped her work, crying: "Oh mother! Captain Prime is coming up the lane. What if—oh, can it be he has found his money?"

"Very likely he has," replied her mother, calmly.

The Captain rode up to the door and springing from his horse, rapped loudly. "Please go to the door, mother," said Molly, faintly, "I can't."

Mrs. Gowen opened the door and greeted her visitor with quiet dignity. He asked for Molly and was invited in. Going straight to the trembling girl, he took both her hands in his and began: "Molly the real thief is found. Will you forgive me for unjustly accusing you?"

For a moment Molly felt as if the solid earth were slipping from beneath her feet, and she would have fallen if he had not caught her. She revived immediately and cried out: "Thank God! Oh, thank God!" Then her tender heart went out toward the real culprit. "Are you quite sure this time, Sir?" she asked earnestly.

"Quite sure," he answered, "for she has confessed."

"Oh, sir," said Molly, "don't be hard on her! Think of all she has suffered, for if I who am innocent, have suffered so keenly, what must the guilty one have endured?"

Capt. Prime was deeply touched by this appeal, though he answered lightly: "Oh, I shan't hurt her, though I don't think her crime has cost her much sorrow; but you haven't said you forgive me, Molly. Do you?" "Freely!" she replied, "you are so good yourself that it makes you angry with wrong-doers."

The captain winced. "Say rather I was too uncharitable and harsh; but I have learned a lesson I shall not soon forget. Why don't you ask me who the thief is?"

"I would like to know if you wish to tell me," she replied simply.

"Well, then, it was no other than Hittie. Yesterday I had occasion to go into the parlor, which, as you know, Mrs. Prime opens only on great days. Hittie was with me, and she ran up to the sofa and said, 'Don't touch my moneys, daddy!' 'Where are your moneys, daughter?' I asked her. 'In here,' said Hittie, crawling under the sofa. I looked under and there in the dark corner was my money in three neat piles."

"As nearly as I can find out, Hittie took the money from the drawer some time that afternoon, and carried it into the parlor, where she played with it awhile and then hid it under the sofa and forgot all about it until she went into the room with me yesterday. So you see my own daughter was the thief after all."

"I remember finding her in there, now," responded Molly, "though I had forgotten it before."

"Well, Molly," said the captain, rising, "Mrs. Prime misses her swift handmaiden. When will you come back?"

"Never!" said a new voice, and Robin, who had entered unobserved, came forward and stood beside the blushing girl. She is going to be married as soon as she gets her wedding finery made."

"Oho!" laughed the captain, "that is the way the wind blows, is it? Well, well! I shall give you a wedding present when the time comes." And with these words and a bow to Mrs. Gowen, he left the house.

Robin would take no denial this time, so Molly consented to be married on the first of the following December, and in spite of what he had said, she went back to her work the following day. Mrs. Prime and Hittie were overjoyed to see her, and she was happy once more.

When, in November, she finished work and went home to get ready for the wedding, Mrs. Prime gave her a gold eagle besides her wages, then, calling her into the keeping-room, showed her a beautiful silk lying on the table. "There, dear," said she, "is your wedding dress."

Molly gazed at it for a moment, in speechless admiration, then, turning to her mistress with swimming eyes, she cried out: "O Mrs. Prime, how good you all are to me! This is too lovely!"

"Nothing is too good for you, Molly," said Mrs. Prime, fondly.

The wedding day dawned bright and fair. Capt. and Mrs. Prime were present, and, after the ceremony, the captain put a slip of paper into Molly's hand, saying: "Here's your wedding present, my dear." The paper proved to be a check for \$500, a great fortune for the simple girl.

Molly often visited her friends, the Primes, and in a few years a little girl named Hannah went with her. Hittie grew up to be a good woman, and always loved Molly dearly.—Dora Annis Chase, in *American Cultivator*.

The Worst for the Farmer.

The *Encyclopædia Britannica*, speaking of barley in its article on Agriculture, says:

"It is, however, in the production of malt liquors and ardent spirits, and in the fattening of live stock, that our barley crops are chiefly consumed. We have no doubt that it would be better for the community if this grain were more largely used in the form of butcher meat and greatly less in that of beer or whiskey."

It has been customary for farmers to look upon distillation as beneficial to them, from the ready market which it affords for barley, and more especially for the lighter qualities of this and other grain crops. But this is a very short-sighted view of the matter, for careful calculation shows that when the laboring man spends a shilling in the dram-shop, not more than a penny of it goes for the agricultural produce (barley) from which the gin or whiskey is made; whereas, when he spends the same sum with the butcher or baker, nearly the whole amount goes for raw material, and only a fraction for tradesman's profit. And not only so, but the man who spends a part of his wages upon strong drink diminishes, both directly and indirectly, his ability to buy wholesome food and good clothing; so that apart from the moral and social bearings of this question it can abundantly be shown that whiskey or beer is the very worst form for the farmer in which his grain can be consumed. Were the \$250,000,000 at present annually spent in Great Britain upon ardent spirits (not to speak of beer) employed in purchasing bread, meat, dairy produce, vegetables, woolen and linen clothing, farmers would on the one hand be relieved from oppressive rates, and on the other, have such an increased demand for their staple products as would far more than compensate for the closing of what is at present the chief outlet for their barley."

My Neighbor's Plants.

My neighbor across the street had a handsome bay window added to the sunny side of her house last fall, and was immediately seized with a desire to have that window filled with plants and flowers during the winter. She had little experience with plants, in fact she had always thought them "too much trouble to bother with." But the bay window fired her with a new ambition, and she went to work with a great zeal and energy collecting her plants. I gave her a great many tips, and several well rooted plants, she bought a number of a florist, and other friends remembered her so that the shelves and brackets in the bay window were all filled, and the window looked very pretty from the street. I was away for several weeks, and soon after I came home my neighbor came over to my house and said:—"I do wish you would come over and see my plants. They're not doing a bit well, and I don't know what is the matter with them; I work and fuss over them all the time, but it don't seem to do any good." I had noticed that the plants seemed in a decline. Some of them had, in fact, quite given up the ghost, and all seemed struggling with a destroyer of some sort.

"Plants never would grow for me," my neighbor continued. "Some folks have a sort of a—knack with plants, and they grow for them without the least trouble." "I don't think so," I said, "plants won't grow for any one, without proper care." I went over to see her plants, a more enfeebled, dejected and hopeless looking lot of once promising plants I never saw. "They need water," I said.

"Think so?" she asked. "Well, I used to water them two and three times a day, because I read in a paper that plants needed lots of water. Then I read that they oughtn't to be watered oftener than once or twice a week, so I stopped watering them."

"Different plants need different quantities of water," I said.

"Do they?" she said innocently. "I supposed they all needed it alike."

"The soil needs enriching in some of the pots."

"Now do you really think so? Well, I thought so too at first, and I put coffee grounds, and soot water, and fertilizer, and bone dust, and liquid manure, and everything I could hear of on them, but it didn't do any good."

"Did you try them all at once?"

"Oh, no; one day I tried one, and the next day another and so on. I read somewhere that soap suds was good, and I doused them good with that, but I don't think it helped any. I washed them well with ammonia and water last week, and I am afraid the ammonia was too strong for some of them."

Some one of her dozen or two of fertilizers had evidently been too much for several of the plants, for they were done with this life.—*Vick's Magazine.*

Summer Exercise for Women.

For several years I have marked a gradual, steady improvement in the physique of our women, due to a better understanding of physiology and observance of sanitary law. Comparatively few remain now who compress vital organs into wasp waists by lacing; sanitary underclothing is more generally worn, and heavy boots with low heels have taken the place of the ridiculous French abominations that once deformed women's feet and ruined their natural gait. False modesty has given place to true, with very great gain to female health and corresponding increase of promise for coming generations.

We are training physically future children when we give their prospective mothers better, stronger bodies, and physicians rejoice at the advent of every plan for further gain in this regard. Systematic out-of-door exercise is the very best prescription that can be given to women, during June, and a few hints as to its employment will answer many questions that have been asked me lately.

It is useless and worse, to persist in claiming that physical exercise for men and women should be alike in degree or kind. In happy, sexless childhood, boys and girls may indeed be allowed the same diversions and muscle training; but when their lives begin to separate by development of sexual instincts (and it is marvellous how early these occasionally manifest themselves), it is no longer practicable nor right to insist upon a similarity of exercise for dissimilar structures.

Women seem to think that house-work, the daily toil that reaches from sun to sun, is sufficient; whereas it is as apart from exercise as labor is from rest.

And yet to be at its best, our exercise must be so regular and systematic as to seem almost like toil. For a general rule, there is no form that does women so much good as walking.

The best period is in the forenoon, when natural forces are mounting up and carrying weakness upon their tide. After the morning bath and toilette, and time will permit the arrangement, an early breakfast of milk and a biscuit should be taken and a start made.—*Dr. Wm. F. Hutchinson, in The American Magazine for June.*

A HIGH-PRICED PIANO.—The highest-priced piano in America is owned by Mr. H. G. Marquand of New York. The works were made by Messrs. Steinway & Sons, and the case, which was built in London, was designed and painted by Alma Tadema. It cost \$46,000.

YOUNG FOLKS' COLUMN.

Prehistoric Arizona People.

EDITORS PRESS:—Since writing to the young readers of the RURAL, I have had a long talk with a Mayo Indian. (Look in your school atlas at Sonora for Rio Mayo). This Indian is much such a looking man as were the former people whose cities covered Salt River valley—at least the measurement under the rules of phrenology would decide him as such—but I will only say that this Mayo is a large strong man, very mean and quarrelsome, and in his way is very religious. He thinks God plans now to kill people who displease Him. I have had an excellent opportunity to examine the shape of the heads of many of the prehistoric people whom Lieutenant Cushing has dug out of their tombs. Oh! horrid, isn't it, to be digging up the graves of other people!

It seems that all common people when they died these prehistoric people burned (cremated), but their rulers or priests they buried in their churches and in their church-yards, which they walled in by high walls, situated always exactly with the points of the compass, and nearly always exactly that of a square.

These people wrote books and letters, but their books were made of slate-rock and their letters were written on strips of wood or pieces of pottery made of clay and mica. They had no letters to spell, as we do, but had characters somewhat like the Chinese.

But what about that howling beast I wrote of in my last letter? Lieutenant Cushing found 13 of them near my house. Here is my theory, and it is based on what I have learned from ideas still held by Indians now living. When sickness like measles, smallpox or other calamities got among this people, they attributed the cause to an angry God, and to appease the wrath of this God the prettiest and best children were sacrificed to Him—that is, killed and burned. This killing and burning of these innocent children were attended with much display and ceremony, and for the form of burial a small portion of the charred remains were put into this stone-like small pot, when they placed the figure of this beast in a praying or howling attitude, standing with his head over the pot of charred embers, ever beseeching. This was worship with the Arizona prehistoric man, who lived long, long ago. Now we dig up these things and think how foolish such ideas are.

Two years ago the Yampais, in Northern Arizona, found some men digging after the curious things in a burying-ground, and one Indian, who talked a little English, came and told the party to quit and put everything back as they found it and then get away speedily, or they, the Indians, would kill every white man in the party. Such deeds as these often make bad Indians. What would you do if Indians, or anybody else, were to come and dig up the graves of your grandfathers out of curiosity?

That is the way we white people treat the Indian, and if the Indian don't like it we call him a bad Indian and get after him, and take his land from him, and put him on a reservation and tell him to be good.

Next time I write to the young people who read the RURAL I will tell them of the Supuy Indians whom I saw down in a vast crevasse, with walls that were perpendicular more than 200 feet high. Yes; and they killed a little girl, too, when we were there, because the little girl's mother had died; because, they said, by so doing the little girl could go along with her mother over to the spirit land.

Tempe, Arizona. GEO. KAY MILLER.

A SENSIBLE DEER.—The Lake *Avalanche* says that last fall Dr. Downes lost a pet deer by its running away to the mountains. On May 21st the deer appeared again, came directly to the Doctor, laid its head on his arm and acted very strangely. While he was not noticing it, it ran away, but returned the next day and repeated its strange actions, as though it wanted the Doctor to follow, which he did. After going some distance from the house, the Doctor found a young fawn only a few days old, which he took in his arms and carried home. The deer evidently had been trying to get the fawn to the house, but could not on account of its weak condition. The doctor is delighted at the new addition to his family of pets.

GROWTH OF AMERICAN RAILWAYS.—The evolution of the railway and of its rolling stock follows the same laws which govern the rest of the world; adaptation to circumstances decides what is fittest, and that alone survives. The scrap-heap of a great railway tells its own story. Our railways have now reached a development which is wonderful. The railway of the United States, if placed continuously, would reach more than half way to the moon. Their bridges alone would reach from New York to Liverpool. Notwithstanding the number of accidents that we read of in daily papers, statistics show that less persons are killed annually on the railways than are killed annually by falling out of windows.

WOOD PULP VS. PLASTER OF PARIS.—Wood pulp is rapidly being substituted for plaster of paris in the manufacture of all kinds of building ornaments in France, where a new method has been devised.

GOOD HEALTH.

THE TEMPERATURE OF THE SKIN.—The experiments of Davy long ago demonstrated irrefutably that the temperature of the interior of the body varied little in man with race, climate or season; yet it is familiar to all that the temperature of the skin varies considerably in different parts—the extremities for example, and those parts of the skin where the circulation is feeble being cooler than other parts. Quite recently some interesting experiments to determine these variations of the surface have been made by Professor Kunkel at Wurzburg. Taking the skin of the face in the first instance, he finds that in men from 20 to 30 years of age it varies from 85° to 89° Fah., with an approximate average of 88°. The skin of the more exposed parts of the body, as the tip of the nose and the lobules of the ear, in which the circulation is slow and feeble, exhibited a lower temperature, not exceeding in many instances 75°, or even descending as low as 71° 5". The skin covering the muscular portion of the body is warmer than that over the bones and tendons. Contraction of the muscles caused the temperature of the superjacent portion of skin to rise one degree or more. The decrease of temperature from the skin to the outer covering in a room at a temperature of 63° was as follows: On the skin 88°, on the linen shirt 82°, on the vest 75°, and on the coat 72°. The highest temperature was found to occur in men in the full vigor of life. As a singular fact, Dr. Kunkel states that children otherwise in perfect health showed a much lower degree of surface temperature—from 77° to 84°—than adults. He does not appear to have followed out Professor Lombard's observations on the temperature of the head.

THE SAFEST WAY TO FALL DOWN.—"The special providence that seems to hover over drunken men and children has something of an explanation," said a well-known and eminent medical man to a reporter, "in the fact of the main cause of the breakage of bones from falls being from a resistance of the tendons more often than from the violence of the shock incident to the actual fall. A child or an intoxicated person will rarely endeavor with any great effort to recover their balance when they slip or topple over. Hence no special resisting force is exercised, and they sink into a collapsed heap without serious injury. When an adult in possession of his full sound senses undertakes with endless contortions and gyrations to save himself from going down, he draws every muscle and sinew taut, and if the wrench is too severe the bone breaks. There is no way of definitely proving it, but it is asserted, and I believe with some degree of truth, that some, at least, of the fractures resulting from falls, especially from a high, happen before the actual shock with the substance one falls on occurs. It's strange, but I guess it is the truth."

CALIFORNIA CLIMATE.—The complaint is sometimes made by Eastern people that the average of human life in California is not as great as it is in the Atlantic States. If that is so—which we doubt—it may be explained by the fact that great numbers of invalids come to this State, by which our death rate is unnaturally increased; and again, people do not take the same care of themselves here that they do East. If men do not reach the average of life here it is also in part because they abuse themselves in various ways here as they do not in the East. They work too hard. Our "glorious climate" gives them strength beyond that usual in other places, and they do not perceive it until they have overtasked themselves in labor or in the pursuit of business. Moreover, a large portion of our people live too high, drink too much, go to excess on tobacco, and in every other thing in which people can exceed the limit prudence would dictate. The graveyards are not peopled by middle aged and young men because of climatic conditions.

INTERESTING TO EVERYBODY.—The feet can be kept warmer in cold weather by wearing a shoe with a light sole than a thick one. With the former the shoe has a chance to work, thereby keeping up a circulation. This, of course, applies only when the weather is dry; but when it is wet, and rubbers are necessary, it is best to wear a single-soled shoe inside. In the summer the thick sole should be worn, for it keeps the heat from striking through to the foot. This is all so contrary to the preconceived opinions of the public that it is doubted whether it will receive much credence, but it is the fact all the same.—*Shoe and Leather Reporter.*

TONGUE INDICATIONS.—According to Dr. Howship Dickenson, a furred tongue is not necessarily an alarming symptom. To some persons it is normal to have a clean tongue, and to others equally normal to have a coated tongue, so that it is impossible to fix any degree or limit of coating as a necessary accompaniment to perfect health.

MILK IN SUMMER TIME.—An argument against allowing children to drink milk in the summer time is drawn by Dr. V. C. Vaughn of the University of Michigan, from the liability of the fluid to develop the poison—tyrotoxin—which is supposed to be the immediate cause of summer diarrhoea.

DOMESTIC ECONOMY.

FRUIT CAKE.—Five eggs, one cup of butter, two cups of sugar, one half cup of syrup, one teaspoonful of soda dissolved in a little sweet milk, two teaspoonfuls of cream of tartar, two cups of flour, one teacup each of citron, currants and raisins.

ORANGE COOKIES.—Into two tablespoonfuls of butter rub one large cup of brown sugar and two quarts of flour. Season with a great deal of orange peel, well grated, and mix with enough molasses to roll thin. Cut in fancy shapes and bake in a quick oven.

OMELET.—Beat the whites and yolks of eight eggs separately until light, then beat together, and add one tablespoonful of cream; put a piece of butter the size of an egg in a frying pan, and when boiling hot pour in the omelet, shake slowly until it begins to stiffen, then let it brown; fold double and serve hot.

FISH CHOWDER.—Take any large fish and cut in thin slices, lay some slices of fat bacon at the bottom of the pot, and then a layer of fish, onions, cracker dust, red and black pepper, salt and butter; then more layers until all the fish shall have been used. Cover the whole with water and cook until well done.

PICKLED OYSTERS.—Rinse the oysters in their liquor, strain it upon them, and let them come to a boil, and take them out of the liquor to cool. Prepare cider vinegar by boiling it with peppers, a little salt, mace, olives and nutmeg, and, when cold, pour it over the oysters, and keep them in a covered stone jar.

PEANUT CANDY.—Remove the shells and brown skins from the nuts. Then boil two cups of molasses, one cup of brown sugar, a piece of butter the size of a small egg, and a tablespoonful of vinegar. Boil until nearly brittle, then place the peanuts in a buttered pan, pour the candy over them, and cut into squares or bars.

CHEESE SOUFFLE.—Beat two eggs very lightly and mix with them a seasoning of salt, pepper and cayenne, three tablespoonfuls of milk and two ounces of grated cheese. Beat the mixture thoroughly, then pour into the tin and bake in a brisk oven. Sometimes a teaspoonful of finely minced onion is added, and by some is considered a decided improvement.

CHICKEN SOUP.—Take all the bones of a chicken, crack them and add the dark meat; cover well with water and stew for three or four hours. Flavor the broth with some thinly cut lemon peel; salt to taste, and add a little sage tied in a piece of muslin. All fat must be removed. This soup, when cold, will be a delicate jelly, and can be melted down as required.

INDIAN MEAL GRUEL.—Make a thin paste of one teaspoonful of flour two tablespoonfuls of best corn meal and a little water. Stir this into a quart of boiling water, or milk and water in equal proportions, as preferred. Cook until the meal has set, stirring constantly; then turn into a double boiler and simmer for 1½ or 2 hours. Season with salt and strain. If too thick, thin with milk or cream.

COLD SLAW.—Cut the cabbage very fine. For a quart of cabbage take the yolks of three eggs, beat them well, 1½ cups of vinegar, two large spoonfuls of sugar, one cup of thick cream, a teaspoonful of mustard, salt and pepper. Mix this with the eggs. When hot, add the cabbage, cover and stew until it is thoroughly hot. Let it cool before bringing to the table. Some add olive oil, but we like butter.

SALMON CROQUETTES.—Boil half a pint of milk, thicken with a tablespoonful of flour and let it become cold. Mince a pound can of salmon or one pound of fresh salmon. When very fine add a saltspoonful of white pepper. Moisten the minced salmon with the boiled milk, work to a paste and add bread crumbs if too thin. When wanted, shape into cakes, rolls or cones, dip in egg and crumbs and fry in hot fat.

CONSOMME FOR FAMILY USE.—Put in a soup boiler a roast fowl, or any portion of roasted fowl, two pounds of lean veal, some roast beef bones and two pounds of soup beef, with two gallons of water and four tablespoonfuls of prepared seasoning. Boil slowly, skim well, add a carrot, a turnip, two leeks, an onion and half a parsnip. Cover closely, and let simmer for hours, then remove all fat, and strain through a wet cloth.

CLAM PATTIES.—Chop the clams fine, put them in a saucepan with a little milk and a portion of their own liquor, and stir in the yolk of an egg; season with pepper and salt to taste. When they are scalded add a tablespoonful of butter mixed with a little flour, let it simmer until the flour is cooked, then remove. Have ready some puff paste or other rich crust with which line patty pans, fill them with the clams, make a ring of the paste to partially cover them, and bake in a quick oven.

POTATO TURNOVERS.—Mash some dry mealy potatoes while they are warm; add a piece of butter, and mix with them two or three beaten eggs according to the quantity of potatoes. Dredge a pasteboard, spread on it the potatoes a good half-inch thick. When cool, cut out in squares or round cakes five inches across. Put on each a large tablespoonful of any remnants of meat or poultry minced fine. Turn over half of the cake to cover it, coat them over with egg and bread crumbs, and bake a delicate brown in a moderate oven.

The Week.

All reports indicate a fair measure of progress in the producing districts. The showers have continued beyond expectation, based upon ordinary experience, and fears of injury to fruit crops have naturally arisen. Such fears have not been well grounded, and anticipated evil has not come. Considering the fact that fruit is grown in countries subject to summer rains should have reassured our people. Even such unusual things as showers in June are not likely to do harm in California because the showers are short and light and the air so dry that moisture is speedily dissipated.

The growth of pasture plants and grains where not dried by previous drouth, has progressed considerably during the showers and the consequent cool air. Much grain has headed well which the usual spring weather would have checked. Consequently there will be plumper grain and more of it than was once expected, but the aggregate crop will be a small one. Hay has, in some cases, been hurt by the rain in coast and northern valleys, but not generally. The fruit is coming on well; the

canners are working full force and shipping is active from the earlier districts. The city fruit and vegetable stands are putting on their summer garb of abundance and variety.

Our Republic.

It is said of Christ that on one occasion he was approached by some of the disciples of John the Baptist who said to him: "Art thou the Prophet that should come, or shall we look for another?" So we have men in our day, many thousands of them, who are ready to say of our Government: "Is this the perfect Government that is to be, or shall we look for its fall, and another and a better to take its place?"

Yes, there are pessimists in the land who see nothing but ruin and disaster, and predict some sudden change, either a revolution to antique imperialism, or a general disorder from which some new form of civilization shall arise. The millionaire leans to the imperial as the best guarantee for vested rights, while the poor rather affect anarchy and socialism as the precursor of a better distribution of wealth.

In truth, there is much in the present structure of society in this new State of California, and also in the whole Union that cannot be commended as either just, rational or indicating wise and permanent Government. A change for the better is most essential to our peace and happiness, and the security of Government and liberty.

It is a fixed axiom of the best minds in the world that good government and free people cannot exist in an atmosphere of extreme wealth and abject poverty. There is no dissent from this opinion among those who have written upon it. From the earliest times till now political philosophers have all agreed that a certain equality and independence are essential to a rational freedom.

George Washington, in his last address to the nation, gave new emphasis to this axiom. He said: "Should the time ever come when wealth, faction or combination may defy and evade the commands of the people, government will be at an end and the republic and liberty only a sham."

It is manifest to all that a degraded, wretched and criminal class is equally dangerous to well-ordered liberty. We have seen symptoms already of what they can do. Our cities are all at their mercy. Fire and explosion in these days of dynamite admit of no defense. The will only is wanted, and we have seen that even that will is being cultivated with assiduity. Our safety lays in the moderation of all those causes that lead to these extremes.

Shall we accomplish that moderation? Most assuredly! It may come late. It may require much crime and suffering to inspire us to action. But when the time comes that these things must be amended or the Republic must die, the amendment will come, and the Republic ride the storm in safety.

The trouble is people have expected too much of the Republic. A proclamation cannot make liberty. A Government cannot establish liberty by law. The people in their minds and hearts must be in accord with the proclamation and the Government or it will be of no avail. It only makes liberty possible to those who are ready for it. It puts a weapon in the hand of the slave if he will use it. But if his education, heart, nature and affection fit him for a slave, no law can liberate him. He who would be free must assert himself.

Then some of us seem to think that a free people will all at once become a good and just people because they are free. It is simply impossible. The new law must first have the assent of the mind. Then it becomes the practice and a habit. Then the whole nature becomes Republican, and the people and the Government are in perfect harmony. This will come, but it will take time.

The Republic is not on the downgrade. It is going upward. Its recovery from the evils resulting from slavery is an evidence.

Here is another evil right at our doors: Wealth, corporations, trusts, syndicates and other combinations, pursuing the methods of the Old World, and the common law, rather than the genius of the Republic, have aimed to do just as slavery did—to seize the Government and override the law. They have assumed a position almost impregnable, just as slavery did. See how they are entrenched.

The majority of the Senate of the United

States are millionaires, the heads of corporations, the leaders in all manner of monopoly. They buy their places with money and corrupt influence.

The laws as they are, with the interpretation of the Supreme Court, just suit them. No law can be changed without their consent. No change of judges can occur without their consent. They hold the door and can resist change so long as they can buy those seats.

Then what are we? Slaves! No more! This Senate is impregnable except by a sublime effort. Will the people make it? Surely. As in the case of slavery, whenever the issue is made, "the people will win, and the Republic live more pure for the ordeal. And more, we shall make monopoly impossible for all future time as we did slavery."

We are working toward perfection in Government and not away from it. The people, the press, 40 Legislatures and Congress are all working, thinking, talking, and enacting for better Government. If a millennium is possible for man they will find the way to it; and if it is not they will find the next best.

Crime, evil, pain and suffering are the inheritance of man. We all have more or less. Government can only ameliorate, increase pleasures and obviate pains in a certain degree, and experience alone can develop how this is best to be done. Patience and hope will wait contentedly for the development, helping it along as best they may. Anarchy is political death, not health, life, happiness or justice.

While society is constructed on the best pattern known to man, and the unfortunate are cared for in asylums, hospitals and almshouses, few have any real right to complain; and most find themselves infinitely superior in all their conditions to anything they could provide for themselves in a state of nature. Let us have peace in our journey to a higher wisdom.

More New Apricots.

New seedling apricots are appearing and putting forth claim to especial excellence. We have often claimed that ere long the chief growth of orchard fruits in this State would be of varieties of local origin. We are especially well provided with California seedling peaches, and in apricots we have many good seedlings and more to come. Two new ones which we hear of this year are first a seedling by W. B. Holliday of Martinez, which is held by the *Gazette* to be a very handsome fruit, equal in size to the Royal and as early as the Pringle. It bore for the first time this year and will be fully tested in the future. Another is a seedling of the Moorpark by Hugh C. Jones, which has been named "Jones' Early" at the Marysville cannery.

The *Appeal* says it "ripens two weeks earlier than the Moorpark, and also ripens uniformly, which is not the case with the parent variety. The fruit is ripe and beautifully clean and bright, and commands a premium over the average price of two cents a pound paid this season. The Jones' Early is a prolific bearer, about 70 pounds of fruit being taken from a tree only three years old this year." Nothing is said about the size. There is also a Moorpark seedling in Alhambra valley, Contra Costa county, which has been highly praised. Moorpark size and quality with more trustworthy bearing, and even ripening, would be worth a fortune to the originator.

THE TRANSACTIONS of the California State Agricultural Society for 1887 make an octavo volume of but little less than 900 pages. Besides the usual acts, reports, and addresses, the book embraces an essay on "Fruit-Growing in California," designed especially to aid beginners, by Gen. Chipman of Red Bluff; G. W. Meade & Co.'s annual review of the raisin, dried fruit, nut and honey product of the State; a communication from the U. S. Commissioner of Agriculture relating to pleuro-pneumonia; an elaborate treatise on "Olive Culture" by Elwood Cooper; grain and flour statistics; the extensive Meteorological Review of Sergeant Barwick, and other valuable and interesting matter. We are indebted for a copy to the courtesy of Secretary Smith.

THE Colusa Town Trustees, in deference to poor widows who own cows, have exempted milch cows from the operation of the pound ordinance.

The Fairs.

We are likely to have a series of industrial exhibitions this fall which will surpass anything ever set forth in California. The spirit of the boom, and its concomitant, the effort put forth by local organizations of progressive citizens in almost every county to see to it that their territory is given its proper place in the eyes of those seeking homes and investments, will result in a more systematic effort to make this year's fairs, both general and local, better represent the industrial conditions and opportunities of the country.

The two great opportunities for organized work for great occasions are the county exhibits at the State Fair in Sacramento, and at the Mechanic's Fair in this city. The managers of both these exhibitions are now actively promoting interest in the different counties. The Mechanic's Institute has appointed good local committees in several counties, and will be glad to do the same for any county in which there appears to be a disposition to bring forward a poor exhibit. The space in the pavilion has not yet been allotted but no doubt it soon will be, and we advise all who contemplate exhibiting to make early application and thus secure favorable places. Last year there was some dissatisfaction resulting from tardiness in securing positions.

There is quite a rivalry between the two great fairs to secure the fullest and best county exhibits, and efforts are being put forth to that end. The result will be the improvement of both fairs, and on this account at least the existing feeling between the two societies is hardly to be regretted. The State Agricultural Society has commissioned Dr. Latham to push missionary work in stirring up the counties in the interest of the Sacramento display, and he is now urging the proposition strongly in the Sacramento valley counties. The county exhibits of last year must prove of lasting benefit to the counties making them. Governor Waterman and four other leading citizens of the State were appointed to award the premiums, and they made an elaborate report upon the exhibits of each of the 10 competing counties, and their resources and the advantages they offer for settlement. This report is printed in the annual report of the society, which goes to every part of the civilized world, and it has been also printed in pamphlet form, and will be extensively distributed. The same course will be pursued this year. A committee of able and distinguished men will be appointed, and the counties exhibiting will receive a full, complete and comprehensive notice, which will have a wide publication.

Every county which has pride in its achievements and faith in its future should lose no time in preparing for this year's exhibitions. Where the county is hard to move in the matter let individual effort and enterprise act. Every county in the State, either by joint or individual displays, should be represented at one or both of the great fairs.

The district county and town fairs should also be brought up to the highest pitch of excellence. The State is full of strangers. They are wandering about seeking something good. They do not all settle down to possess the first fine thing they see. They are pushing out, away from the railways, across mountains into the uttermost corners of the State to see if something especially good has not been overlooked. The fact is that much of the best of the State has been overlooked by many, but it will not always be neglected. Good local fairs properly advertised will draw even to remote localities, very desirable people. Let this be the incentive to extra efforts at all local fairs this year.

NEW OVERLAND RATES ON FRUIT.—Just as we go to press, the railroad authorities have issued their new rates on eastern shipped fruit. The announcement will be found in full upon another page of this week's *RURAL*. We have not time to study the rates closely or comparatively, but give the statement at once so that our readers may all have it at the earliest moment. Shipments of early fruits have been unusually large, and, if nothing unfavorable appears at the other end of the line, the amount of fruit which will cross the continent will cast all previous exports in the shade.

VENTURA county claims the largest apricot farm in the State. It has 1000 acres.

Gen. Sheridan.

One of the great heroes of the war, General Sheridan, has been lying at death's door for the last two weeks or more, and it is probable that his course in this world is at an end. Since illness prostrated him he has had renewed evidence of the esteem in which he is held by his fellow-citizens. He has received his commission as General of the United States Army, and from his sick-bed issued his first order. At the National Democratic Convention in St. Louis

the head of his soldiers that the artist has caught in his portraiture, but it will serve well to bring the hero to mind in the time of his great danger and suffering.

Gen. Sheridan was born in Albany, N. Y., March 6, 1831. His parents were Irish and came to this country a short time before his birth. He graduated at West Point in 1853, and for four years was assigned to frontier duty. In May, 1862, he was appointed Colonel of the Second Michigan Volunteer Cavalry, and his gallantry at Stone River and other places

Water Supply of the Yosemite.

At the meeting of the Yosemite Valley Commission, held last week, a resolution was unanimously adopted setting forth the need of guarding the water supply of the falls in the valley. It is held that the streams which feed the falls are being denuded of their timber, grass and shrubbery, and that the snow, upon which the volume of water depends, exposed to the sun will disappear in early spring, causing destructive floods in the lower part of the valley early in

Fire.

The day our last issue went to press, a fire started on G. D. Connor's place 20 miles east of Sacramento, burned over 200 acres of pasture, got into a wheat-field and gave 50 fighters plenty of work before it was subdued.

This is at least the third reminder we have had that it is time to be on guard against the small beginnings of what may become great and costly conflagrations. Every year as early summer comes along, it seems necessary to repeat

GENERAL PHILIP H. SHERIDAN.

last week, a resolution of sympathy and solicitude was adopted by a rising vote. Besides these public declarations of respect there are expressions of universal interest and sympathy from private individuals, and hope is general that the hero of the Shenandoah may yet live many years in the land for which he has performed such signal services.

Our engraving presents a view of Gen. Sheridan as he is commonly held in the public mind, a daring soldier at the head of his cavalry. It is, probably, rather the popular idea of Sheridan in action than his real appearance at

in the West, and how like a storm of fire he dashed down the Shenandoah valley, and after several brilliant successes, entirely wiped out the Confederate army under Gen. Early, has become matter of school history. The picture represents him on the celebrated Winchester ride, when he snatched victory from the jaws of defeat.

At 57 years of age Sheridan ought to be in the prime of life, especially as there is a sort of rule that the soldier who has escaped the perils of war enjoys life longer than the average men,

the season, and leaving the channels of the falls dry in autumn. To prevent this result, our Legislature is asked to petition Congress for a grant of land along the courses of the streams, whereby they can be protected from the destructive influence of sheep-grazing, from forest fires, from the precipitation of the debris, from the demolition of the forests, and from all other destructive influences.

The idea is a good one. The charms of the Yosemite should be faithfully guarded. As our State grows in population the greater treasure the valley will become,

the old, old cautions about the matches heedlessly dropped, the cigar stump thoughtlessly tossed away, the hunter's paper gun-wadding, and the camper's neglected embers.

We suppose there must be some field and forest fires the coming summer, but an earnest yet kindly word fitly spoken to the inconsiderate and careless may prevent a good many of these disasters, so let us each speak such words as we have occasion, with discreetness and to the point, and act accordingly. A little timely thought may save great losses and so make great gains.

THE VINEYARD.

The California Grape Interest.

Arpad Haraszthy, for eight years president of the State Board of Viticultural Commissioners, has just completed his annual report of viticultural progress and will soon send it to Governor Waterman. As Mr. Haraszthy is now retired from the commission, having been succeeded in office by John T. Doyle of Cupertino, he takes this opportunity of reviewing at some length the progress of vine-planting and wine-making in this State.

It is assumed that there are now planted in California 150,000 acres of vines, which will all be in full bearing within three years. Allowing these an average value of \$300 per acre, without other improvements, we will have a valuation of \$45,000,000. Of course there are vineyards not worth \$200 per acre, but these are few in number and either planted with the Mission or some other equally common varieties of grapes. On the other hand, many of our vineyards are worth considerably more than \$300 per acre, which difference would more than balance the discrepancy of the above estimates. Mr. Haraszthy reckons the value of the improvements necessary to carry on the vineyard business successfully at \$20,000,000. These improvements consist of fences, houses, barns, cellars, presses, tanks, casks, distilleries, agricultural implements and machinery, live-stock, etc. These two estimates thus made would place the present capital invested in viticulture in California at \$65,000,000. Comparing the present valuation with that existing previous to the creation of the State Board of Viticulture, we are confronted with the following interesting results: Thirty-five thousand acres in vines, of which 80 per cent were Mission grapes, at \$300 per acre, which gives \$10,500,000; proportionate other improvements necessary to carry on the vineyards, etc., \$4,000,000. Total investment, \$14,500,000. Thus showing a direct increase of \$50,500,000 in the viticultural investments within the last eight years, and, of course, yielding a proportionate greater income by taxation to the State through the enhanced value of vineyard and contiguous lands.

Eleven Years' Wine Production.

The amount of wine produced during the past eleven years is given as follows in gallons:

1877	4,000,000	1883	8,500,000
1878	5,000,000	1884	10,000,000
1879	7,000,000	1885	11,000,000
1880	10,200,000	1886	18,000,000
1881	8,000,000	1887	15,000,000
1882	9,000,000		

It is estimated that about 2,000,000 gallons of wine are yearly consumed in this city and Oakland. The demand of the interior, Arizona, Oregon, Nevada, Utah and Washington Territory amounts to about 3,000,000. Last year about 7,000,000 were sent East. It is urged that the State does well to foster an industry that yields such returns and a forecast for three years is made. Assuming that our 150,000 acres will be in full bearing at the end of that time, that 15,000 acres of these are planted for raisins, and 10,000 for table grapes, we have left 125,000 acres for wine and brandy making. These figures will yield us a possible one and a half million boxes of raisins; 40,000 tons of table grapes for export and home consumption; 50,000,000 gallons of wine and one and a half million gallons of brandy. The total valuation of these three products will be \$16,300,000. The reputation of our wines is favorably increasing both among ourselves and among the wine-drinkers in other countries. This is owing chiefly to the laudable ambition of our wine-makers, not only to increase their knowledge in the modes of fermentation, but also to their persistent efforts to secure better quality, through the planting of vines better adapted to their locality, and selecting the finer varieties of grapes even at the expense of quantity. Last year 8,496,344 gallons of wine and 256,104 gallons brandy, came to this city from the interior. In 1875 the receipts here were only 1,996,629 gallons of wine and 52,036 gallons of brandy. Since 1875, 38,791,384 gallons of wine valued at \$21,025,045, have been sent out of the State. Shipments last year amounted to 6,901,771 gallons of which 4,943,739 gallons went by rail and 1,958,032 by sea. Brandy shipments from the State last year were 472,752 gallons valued at \$774,313. Since 1875, 2,598,794 valued at \$5,201,412, have been sent from the State. A bad reputation which California wines some years ago earned abroad is attributed to the general use of Mission grapes which experience has shown only produced an ordinary coarse wine, taking an indefinite period to mature. Most of our vineyards are now planted with vines yielding finer qualities and greater quantity.

"What to do, and how to be happy while doing it," is the title of an octavo pamphlet of 188 pages by A. I. Root of Medina, O. It is intended to show the advantages of a "small farm well tilled," and gives the latest and most improved methods of cultivation, fertilization, raising of small fruits, vegetables, care of poultry, bees, etc., under eastern conditions, but still makes a "country scrap-book" of economical and useful suggestions for farmers and persons of small means.

QUERIES AND REPLIES.

Wire Worms.

EDITORS PRESS:—Inclosed we send you a specimen of a worm which has got away with all of our garden truck by eating holes through the seed, and if any should escape them they eat through the root and stock of any and all of the vegetables that we have planted. We will be very much obliged if you or any of your readers can tell us a way to exterminate them.—D. & W., Tehama county.

The insects are "wire worms," the larvae of a small beetle of the *elateridae* or skip jacks or tumble-bugs, as the boys call them. They are beetles which, when placed on their backs, throw themselves over, right side up, with a snap. There are many remedies for the worms, some of which are practicable in the gardens, but obviously not in field cultures. Disting root from the stovepipe or chimney around the plants before a shower or before watering is an old prescription. It also is a good fertilizer. Salt sprinkled in the same way, but not in quantity enough to kill the plants, is also commended. Wire worms can be trapped by taking potatoes, cutting out the eyes so they will not grow, cutting the potatoes in halves, thrusting a pointed stick in each piece, and then burying it a couple of inches under ground near the roots you wish to save. The worms will go into the potatoes from choice, and every second day the potatoes can be pulled out by the handle, the worms killed, and the trap reset. Mr. Cooke reported that ground on which it was impossible to grow lettuce because of wire worms, was cleared of them by the potato-trap remedy. Wire worms are said to be exterminated by growing a crop of white mustard on the ground and turning it under when a foot or so high. After the mustard is turned under, sow your garden crops.

Who Has Red-Polled Cattle?

EDITORS PRESS:—Please inform me through the PRESS if there is any of the red-polled milch cattle in this State.—JOHN MEWHINNEY, Pomo, Mendocino Co.

We should like to know more about this stock. If we mistake not, a reader of the RURAL reported having them a year or more ago.

In Pleasants' and Vaca Valleys.

EDITORS PRESS:—The writer took a ramble last week through the beautiful fruit section known as Pleasants' and Vaca valleys, and thinks a few items jotted down on the trip may be of interest to some of your readers.

On the way from Woodland to Winters—20 miles—the party often spoke of the fine looking grain. A good many fields of summer-fallow stood as high as the fences; winter sown, rather short, but well headed.

The apricot crop is heavy around Winters, and thence up to the entrance to Putah Creek canyon, but in Pleasants' and the upper end of Vaca valley they are pretty light.

Stopped on the way over and back at the orchard of Brinck Bros., saw them shipping Royal 'cots and Alexander peaches to Chicago. Everything if handled systematically there. We were told that the reports from the fruit already sent were good, and that they thought the cool moist weather had ripened the fruit perfectly, thereby insuring its good carrying quality. The crop is not very heavy, but they were making the most of it.

All the way through the valleys the scenery at this time of year is beautiful. Orchards and vineyards, from the lowest part of the valley to the very top of the lower hills, all looking so fresh and green. As we began to descend into Vaca valley we noticed that the apricots were more abundant, and down near Vacaville the crop is good—at least around Mr. W. W. Smith's where we made our stay. Mr. Smith has all his trees well bear, and has picked them off so that the ground beneath is covered.

If any of your readers think Mr. Smith does not know how to entertain strangers, let them give him a trial. The writer has not in his remembrance a more pleasant and profitable time spent in talking fruit and orchard culture. Any one seeing those tall cherry trees and the beautiful arches underneath will not soon forget them. We there had a chance to see the tree from youth to maturity, which is an object-lesson not to be found in books, and also learned the names of the apricots asked for in the RURAL of May 19th. Tree number 1 goes by the name of "Large Early"; number 2 is the "Breda"; number 3 is the "Royal."

Everything on Mr. Smith's place looked well except the morning-glory, which looked very weakly. There were not over a dozen vines, and those Mr. Smith promptly pulled up. I guess that is the best solution of the morning-glory question—plenty of cultivation and constant watchfulness to keep it underground. Another thing I noticed that looked badly was digging up grapevines that the phylloxera had killed. I fear that pest has come to California to stay. If so, the vineyard is only a question of time, especially the wine vineyard, for they appear to attack the wine grape first.

Peaches, prunes and plums were a good crop everywhere I noticed them; but the pear is rather light, so far as I could learn.

There is no prettier scenery on the coast than those fruit regions present at this time of year,

and any one, who has time for such an outing, cannot do better than take a trip up Vaca and Pleasant valleys and get acquainted with her genial and whole-souled people.

J. R. SPRINGER.

Woodland, June 8, 1888.

Sheridan's Ride.

Up from the south at break of day,
Bringing to Winchester fresh dismay,
The affrighted air with a shudder bore,
Like a herald in haste, to the chieftain's door,
The terrible grumble, and rumble and roar,
Telling the battle was on once more,
And Sheridan twenty miles away.

And wider still those billows of war
Thundered along the horizon's bar;
And louder yet into Winchester rolled
The roar of that red sea uncontrolled,
Making the blood of the listener cold,
As he thought of the stake in that fiery fray,
And Sheridan twenty miles away.

But there is a road from Winchester town,
A good, broad highway leading down;
And there through the flush of the morning light,
A steed as black as the steeds of night
Was seen to pass, as with eagle flight.
As if he knew the terrible need,
He stretched away with his utmost speed;
Hills rose and fell; but his heart was gay,
With Sheridan fifteen miles away.

Still sprung from those swift hoofs, thundering south,
The dust, like smoke from the cannon's mouth,
Or the trail of a comet, sweeping faster and faster,
Foreboding to traitors the doom of disaster.

The heart of the steed, and the heart of the master,
Were beating like prisoners assaulting their walls,
Impatient to be where the battle field calls;
Every nerve of the charger was strained to full play;

With Sheridan only ten miles away.
Under his spurning feet the road
Like an arrow Alpine river flowed,
And the landscape sped away behind
Like an ocean flying before the wind,
And the steed, like a bark fed with furnace ire,
Swept on, with his wild eye full of fire,
But lo! he is nearing his heart's desire—
He is snuffing the smoke of the roaring fray.
With Sheridan only five miles away.

The first that the General saw were the groups
Of stragglers, and then the retreating troops;
What was done—what to do—a glance told him both.
And striking his spurs with a terrible oath,
He dashed down the line mid a storm of huzzas,
And the wave of retreat checked its course there,
because

The sight of the master compelled it to pause.
With foam and with dust the black charger was gray;
By the flash of his eye, and his red nostril's play,
He seemed to the whole great army to say,
"I have brought you Sheridan all the way,
From Winchester down, to save the day."

Hurrah, hurrah for Sheridan!
Hurrah, hurrah for horse and man!
And when their statues are placed on high,
Under the dome of the Union sky—
The American soldiers' Temple of Fame,
There with the glorious General's name
Be it said in letters both bold and bright:
"Here is the steed that saved the day
By carrying Sheridan into the fight,
From Winchester—twenty miles away!"

—Thomas Buchanan Read.

SAN FRANCISCO AT AN ENEMY'S MERCY.—With the evident want of preparation, granting our present defenses their full value, the San Francisco bay could be entered by an enemy's fleet without meeting with any material opposition. The city and surrounding towns could be shelled; the communications with the interior could be cut off, and irreparable loss would be suffered by the destruction of our naval and military stores at Mare Island and Benicia.—Gen. O. O. Howard, in the *American Magazine*.

PERSONAL.—We had a call on Tuesday from James Harold of the *Town and Country* of Sydney, Australia. Mr. Harold was a resident of California a few years ago and now returns to revisit the old scenes and to study our horticulture, with a view of culling whatever information may be of interest to the readers of the enterprising journal with which he is connected.

HALL'S
SARSAPARILLA!

THE BEST BLOOD PURIFIER AND
Tonic ALTERNATIVE IN USE.

It cures disease originating from a disordered state of the blood or liver. It invigorates the stomach, liver and bowels, relieving dyspepsia, indigestion and constipation; restores the appetite and increases and hardens the flesh. PALM VALLEY!

TROPICAL WONDERLAND!

EARLIEST FRUIT LAND IN THE WORLD.

EARLIEST VEGETABLE LAND IN THE WORLD.

FINEST WINTER CLIMATE IN THE WORLD.

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?

DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?

DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?

DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND COMPANY

Has secured 2000 acres of this choice land; has subdivided it into 5 and 10 acre lots, which they are now selling at \$200 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. Two hundred acres have now been sold on this basis, starting at \$150 per acre. The price is now \$200 per acre.

The Company has a Stone-walled Irrigating Canal, over ten miles in length, completed.

They have completed a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the town site owned by the Company.

They are planting 160 acres to an orange grove, of Navel oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State.

No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

THERE IS NO FROST, NO FOG, NO HARD WINDS.

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

MERY'S IMPROVED PIONEER BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

VALUABLE IMPROVEMENTS HAVE BEEN ADDED THIS YEAR.

This Mill has been in use on this Coast for 7 years. **TAKEN THE PREMIUM AT THE STATE FAIR**

Four years in succession, and has met with general favor, there now being

Over 225 of them in use in California, Nevada & Oregon.

It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

CHICO, CAL., Feb. 1, 1887.
M. L. Mery, Esq. - DEAR SIR: The 3x14 Barley Crusher bought of you and used in the California Mills, gave entire satisfaction; have crushed 8000 pounds an hour. I have also crushed as much or more on set 10x20 when working for General Bidwell, which set he is using in his mill to-day. Yours truly,
GEO. SHAND.

ORLAND, CAL., August 5, 1887.
Mr. M. L. Mery - DEAR SIR: In reply to yours of August 1, 1887, regarding the mill I bought of you, would say that the No. 2 gives perfect satisfaction, and that I can crush from 1000 to 1200 sacks of Barley per day. I will recommend it to the public for good work and lots of it.
M. C. DILLMAN.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY, Chico Iron Works, Chico, Cal.

And any work for which a Scraper can be used. This implement will take up and carry a load to any desired distance. It will distribute the dirt evenly or deposit its load in bulk, as desired. It will do the work of Scraper, Grader and Carrier. Hundreds of these Scrapers are in use in all parts of California. References given on application. ADDRESS ALL ORDERS TO G. LISSENDEN, Manufacturer, Stockton, Cal.

Viticultural Commission.

The regular semi-annual meeting of the State Viticultural Commission was called to order by Vice-President Wetmore Monday morning. There were present Commissioners Wetmore, Krug, West, De Turk, Shorb, Manlove and Doyle, also Chief Executive Officer Wheeler and Secretary Clarence J. Wetmore.

Chief Executive Officer Wheeler reported that the report of the last convention would be ready in a short time for distribution; that the 1887 report of the Commissioners would soon be ready to be sent to the State printer; also that he has had translated a treatise on wine-making by Ladrey, and when printed by the State printer would be for free distribution.

The Chief Executive Officer was then instructed to confer with the Committee on Distillation and prepare an essay on distillation, and to submit the same to the board.

The election of officers for the ensuing year then took place, resulting as follows: President, Charles A. Wetmore; vice-president, I. De Turk; treasurer, Charles Krug; secretary, Clarence J. Wetmore; Chief Executive Officer, J. H. Wheeler.

Mr. Doyle then offered a resolution, which was adopted, directing the Chief Executive Officer to ascertain and report to the board under what section of the Revised Statutes and Departmental Rulings cherry juice, so called, is admitted by the custom officers at a less rate of duty than distilled spirits, which form a component part of it of chief value.

At the afternoon session Mr. Krug moved that the president appoint a standing Committee on Statistics, whose duty will be to supervise and direct the gathering of statistics in conjunction with the officers of the commission. The motion was carried and the president appointed the following committee: Messrs. Krug, West and Shorb.

At Tuesday's session C. A. Wetmore, chairman of the Committee on Permanent Exhibit and Viticultural Trade Exchange, reported that the members of the committee had consulted together and had agreed upon the following prospectus:

Prospectus of proposed Permanent Exhibit and Viticultural Trade Exchange, under control of State Viticultural Commission.

First—A commodious store should be rented, on ground floor, with good cellar, in a favorable locality.

Second—Transfer of all the present offices of the commission to such store, after fitting up suitable rooms by proper partitions, etc., reserving the larger portion of such store for (a) permanent exhibit of wines, brandies, raisins and other viticultural products of California, together with maps, photographs and other illustrative attractions for the general public.

(b) Sampling department, where an opportunity will be given to purchase and sample any of the products offered by producers and admitted in accordance with rules governing the same; exhibitors in this department to be credited with proceeds of products sold at their regular trade prices and profits of retailing same to defray expenses as far as practicable, and all surplus profits to be paid into the State Treasury. Visitors in this department to be guided only by their own tastes and desires, aided by the catalogue; all interference on the part of the management and service in guiding taste or selection to be strictly prohibited. The management not to be responsible for unsold sample, excepting reasonable care of same, which shall be subject at any time to withdrawal by the exhibitor after paying any necessary expenses incurred specially with respect to them; such exhibits shall be subject also to be returned to the exhibitors at any time in accordance with the rules of this department. Sampling also provided for in this department of such experimental stocks which are the property of the State from the experimental cellar as may from time to time be determined.

Prices for retailing samples to be as fair as practicable, but so fixed as not to come into unfair competition with the ordinary retail trade. All attempts to use this department for the purpose of undercutting fair trade prices to be discouraged by strict rules, but every encouragement in favor of good prices for superior goods to be afforded in order to stimulate the production and care of fine products.

(c) Viticultural Trade Exchange, wherein facilities for producers, brokers, tradesmen, and wholesale merchants to meet and examine products by sample will be afforded subject to special rules.

(d) Cellar for storage and experimental work.

Third—Management: The permanent exhibit and sampling to be under general direction of a special committee, and managed by an officer of the board, with such assistance as may be found necessary. In case this work is added to the work of the secretary, an additional compensation to be allowed for the same.

Fourth—The Exchange Department, to be organized by the Executive Committee of this board, with power to associate with them an advisory board of control from outside the Commission whose rules shall first be reported to the Commission for approval.

A Permanent Exhibition.

After considerable discussion on the above plan, the following resolution was offered by Mr. Doyle and unanimously carried:

Resolved, That a permanent exhibition of viticultural products of the State be established in connection with the offices of the Commission in the city of San Francisco; that the plans outlined by the Special Committee just reported, be approved, and that it be referred to the Executive Committee to prepare and adopt the details of such plan, and to carry the same out; that the premises under the Mechanics' Institute building on Post street are deemed suitable for the purpose, and the committee is authorized to rent the same unless more desirable ones be found, and fit the same up for the offices of this Commission, the permanent exhibition of products aforesaid

and with a view to the establishment of a Viticultural Trade Exchange on the same premises.

Committees to Act.

The President then appointed the following committees: Executive Committee, De Turk, West and Manlove; Auditing Committee, Manlove; Finance Committee, Doyle, Rose and Shorb; Vine Pests and Diseases of the Vine, De Turk, West and Manlove; to Confer with Board of Regents, Doyle, West and Krug; Distillation, Counterfeits, and Adulteration, Shorb, West and Krug; Evils Resulting from the Introduction of Foreign Fruit Juices as at Present Allowed, Doyle, West and De Turk; Raisin and Table Grapes, West, Rose and Manlove; Experimental Wine Cellar, Wetmore, De Turk and Krug. Mr. Shorb then moved that a committee of three, of which the President should be chairman should be appointed to wait upon Miss Kate Field, and see if she would accept the office of lecturer for the Eastern States on subjects pertaining to the wine industry, and if she would accept to see if satisfactory arrangements could be made. The following committee was appointed: Wetmore, Shorb, and Doyle.

On the motion of Mr. Shorb the Executive Committee was instructed to draft a set of resolutions showing the appreciation of this Commission for the work done in the past for the viticultural industry of the State by Mr. Arpad Haraszthy, late president of this Commission.

Hoopa Indians' Fair.

We learn from the Eureka Standard that Capt. Dougherty, Indian agent at Hoopa valley, Humboldt county, has sent out a poster, of which the following is a copy:

First Annual Fair, Hoopa Valley, Humboldt County, California.

An exhibition of the agricultural and other industrial products of the Hoopa Indians will take place at Hoopa on September 14 and 15, 1888. All entries will be free, and limited to the Hoopa Indians living on the reservation.

First Day.

Awards will be made as follows: 1st—For the best cultivated farm and garden, a silver medal of the President, sent by the Commissioner of Indian Affairs; 1 wagon, 1 set double harness, 1 plow and 1 harrow. 2d—For the second-best cultivated farm and garden, a bronze medal of the President, sent by the Commissioner of Indian Affairs; 1 wagon, 1 set double harness, 1 plow and 1 harrow. 3d—For the best exhibit of hay, properly cured and stacked, 1 cow and calf. 4th—For the best exhibit of potatoes raised in the valley, \$5. 5th—For the best exhibit of corn raised in the valley, \$5. 6th—For the neatest and best regulated household and premises, 1 set household furniture, consisting of 1 cook-stove and furniture, 1 bedstead and springs, 1 table, 1 dinner set (half dozen), 1 wash-stand, 1 bowl and pitcher, 1 looking-glass, 2 water buckets, 1 lamp, 1 set tinware. 7th—For second neatest and best regulated household premises, the same, of second grade. 8th—For the best matched team of work-horses or mules, broken to harness and owned by the exhibitor, one light wagon. 9th—For the best matched pair of three-year-old horses, broken to harness and owned by the exhibitor, \$10. 10th—For the best matched pair of two-year-old colts, owned by the exhibitor, \$5. Pony races—Horses to be 4 years old or over, half-mile dash; three heats, \$5 each.

Second Day.

Awards will be made as follows: 1st—For the best milk cow, owned in the valley, \$5. 2d—For the best two-year-old heifer, raised in the valley, \$2.50. 3d—For the best exhibit of butter made in the valley, 1 churn, 1 milk-pail, 12 milk pans and \$5. 4th—For the best bread, baked on the day of exhibit, 1 cooking stove and fixtures and \$5. 5th—For the best exhibit of women's and children's clothing, hand-made, 1 sewing machine. 6th—For the second best, 50 yards of gingham, 1 dozen spools of thread, etc. 7th—For the best exhibit of new basket-work, of all kinds, one woman's outfit of clothing, worth \$15. 8th—For the second best exhibit of new basket-work, 50 yards print, 1 fine shawl, etc. 9th—For the best exhibit of lace and crochet work, 1 sewing machine, 10th—Pony races—Horses to be 4 years old or over, half-mile dash; three heats, \$5 each. 11th—Slow mule race, bareback; half-mile, \$5. 12th—Wheelbarrow race, blindfolded, \$2.50. 13th—Sack race, \$2.50.

COL. STEPHEN G. WHIPPLE,
MAJOR FRANK M. COXE,
T. M. BROWN,
Committee on Awards.

WM. E. DOUGHERTY, Agent.

The result of this new departure in the conduct of Indian affairs will be looked for with a good deal of interest.

COMBINATION LIVE STOCK SALE—The plan of combination sales as conducted by Killip & Co. of this city, is of advantage both to purchasers and sellers. It enables several owners who have not stock enough to hold a special sale to get the advantage of a collection of buyers, and it saves buyers time in bringing a long string of animals before them at a single standing. The next sale is advertised in the RURAL this week, and consists of a good collection of track and road horses, trotting colts and fillies, stallions and brood mares, including the well known trotting horse Conde with a record of 2:20. Bay District Track, Wednesday June 27th, is the occasion. Catalogues can now be had of Killip & Co., 22 Montgomery street. Part of the stock can be seen now, and the balance on June 24th.

THE Standard and Morning Post advise the farmers of Ontario, Canada, to abandon wheat-growing and raise cattle. The text for this advice is reports of bad crops.

Chautauqua Assembly.

The Pacific Coast branch of the C. L. S. C. will hold its tenth annual summer assembly at Pacific Grove, Monterey, July 5 to 14, 1888.

Special facilities are to be afforded this year for the pursuit of natural history. The class work in general botany will be directed by Mrs. Jennie N. Hughes, of Auburn, who was a pupil of Prof. Asa Gray for four years at Harvard University; while those who wish to study the flora of the sea will find a "guide, philosopher and friend" in Dr. C. L. Anderson, of Santa Cruz. Prof. Josiah Keep, of Mills' College, is admirably fitted to teach conchology, and will lead the learners about shells.

The S. S. Normal department is in charge of Rev. H. H. Rice, of Oakland, and Misses M. C. Hudson and L. M. Washburn, of San Jose.

Prof. F. Loui King, of San Jose, and H. B. Pasmore, of San Francisco, have direction of the music, and will arrange two grand concerts for the Saturday evenings of the assembly; and Miss Emma Wetherell, of Oakland, an accomplished elocutionist, will give readings daily.

Besides those already named, addresses are expected from Rev. Dr. Stratton and Miss J. Tolman of Mills' College, Prof. M. H. Alexander of San Jose, Rev. S. W. Brown of Santa Barbara, Rev. H. C. Minton of San Jose, Rev. W. C. Merrill of Sacramento, Prof. and Mrs. J. G. Lemmon, Dr. W. C. Bartlett of S. F., Rev. M. Willets of Santa Cruz, Revs. G. W. James and C. W. Wendte of Oakland, Dr. Schaeffer of Penn., J. V. Cheney, Judge Myrick and Rev. Dr. Izer of S. F., and Drs. Bentley and Wythe of Oakland, and Gen. Howard is to give his famous lecture, "Gettysburg."

All who wish for programs and further information respecting this "Summer School of Science" should apply to the secretary, Mrs. M. H. Field, San Jose, to whom we are indebted for the tasteful pamphlet of announcements.

Postage on Seeds and Plants.

The high rate of postage on seeds, cions, etc., sent from point to point in the United States, has been complained of ever since, a dozen years ago, our Government fixed it at a cent an ounce. This has been felt to be all the more oppressive under the later postal convention with Canada, whereby matter of that sort can be mailed from post-offices in the Dominion to those within our borders at the rate of four cents per pound, or one-quarter the amount that would be charged on the same packages if posted in the United States.

It is argued that while the Government is laying out thousands and thousands of dollars a year, in the free distribution of seeds, etc., through the mails, with the aim of encouraging agricultural interests and introducing new and choice varieties, the seedsmen—with their united means and experience—are accomplishing this good work a great deal better; and that the lower the postage, the less the farmer will have to pay for his seeds, since it is he and not the seedsman who bears that expense.

We referred to this subject several times during the past spring, making mention of the trouble in N. Y. State, occasioned by throwing business across the Canada line, of the strong and spreading conviction that legislative relief should be afforded, and of the demands for reduction which had been made upon Congress by the National and various State Granges, Boards of Agriculture and other organizations. We are pleased to note the passage by the U. S. Senate of a bill reducing the postage on seeds, bulbs, plants and cions, and we sincerely hope that this much-needed measure will pass the House of Representatives, also, before the close of the session.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JUNE 5, 1888.

384,119.—BOILER-FEEDER—A. Blatchley, S. F.
384,124.—ELEVATED CABLE AND CAR PROPPELLER—H. Casebolt, S. F.
384,136.—GATE—John Donnelly, San Mateo, Cal.
384,050.—HYDRAULIC PUMP—J. H. Martin, Oroville, Cal.
384,171.—EASEL—E. R. Morris, S. F.
383,976.—ROTARY VALVE—Jas. O'Donnell, S. F.
383,977.—GRINDSTONE HANGER—D. O'Leary, San Bernardino, Cal.
383,993.—NECKTIE FASTENER—W. R. Sargent, S. F.
383,996.—ROTARY PUMP—O. Seifert, S. F.
384,089.—CARTRIDGE-LOADING MACHINE—Prentiss Selby, Oakland, Cal.
383,997.—SIDE-HILL PLOW—A. K. Snodgrass, Ellensburg, Ogn.
384,179.—CLOTHES DRIER—E. S. Sutton, Snohomish, W. T.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

A VERY heavy and prolonged rain has fallen in the Puget sound section of Washington Territory.

News in Brief.

THE White Star cannery at Astoria was destroyed by fire on Tuesday last.

OVER two-thirds of the saloons in Philadelphia are closed by the Brooks law.

THE spring rodeos having ended, cowboy tournaments are taking place in Arizona.

THE murderers of John Lowell, the wealthy Sacramento farmer, have been captured.

THE records of the Patent Office show that women have obtained patents on 1900 inventions.

A FIRE entailing a loss of \$90,000 occurred in a business block on Broadway, Oakland, on Monday evening.

WOMEN are the State Librarians of Indiana, Iowa, Kentucky, Michigan, Louisiana, Mississippi and Tennessee.

THE price of diamonds has fallen. It was over 22 shillings per carat in October, 1887, and it is now less than 18 shillings.

THE payroll of the Comstock mines for May aggregate \$238,575, of which amount, the Enterprise says, \$30,000 was paid in silver.

THE Fresno Free Library trustees advertise for plans and specifications for a two-story brick library building 50x80 in size.

THE Santa Paula Chronicle reports the shipment of 184 tank-cars of oil from that place during the month of May, the largest shipment ever made in one month.

A LETTER has been received by the Immigration Bureau at Mayville that a wagon train is being made up in Hickory county, Mo., consisting of 18 families, to cross the plains to Yuba county.

A CANAL has been projected along the foothills from a point near Firebaugh's, Fresno county, to Tracy, San Joaquin county, taking water out of the San Joaquin river at the first-named place.

NEWS has been received by J. D. Redding, Deputy U. S. Fish Commissioner on this coast, that a carload of selected lobsters for breeding purposes will leave the East for this city some time during the present month.

TWELVE artesian wells are to be bored to furnish water for the Watsonville beet-sugar factory, which will use 2,000,000 gallons daily. While boring one of these wells a day or two ago a piece of a redwood tree was encountered at a depth of 140 feet.

CLAUDE SPRECKLES reiterates the statement that his sugar refinery at Philadelphia will be going within a year, with a daily capacity of 1000 tons, which will be a much larger capacity than any other refinery in the country. The work will be rapidly pushed.

THE valuation placed on the assets of Wm. T. Coleman & Co. by the assignees is very much less than the original estimate. It is said the difference in these estimates will wipe out entirely the surplus that at one time it was thought would remain after liquidating.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, IF REQUESTED the following articles (while this notice continues), at the very greatly reduced figures named at the right:

APIARIAN SUPPLIES for sale by Mrs. J. D. Enas, Napa City, Cal.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE! FERTILIZE! NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOBRIE—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture. Berkeley, Nov. 20, 1886.

DR. J. KOBRIE, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Socranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

HORTON & KENNEDY'S

FAMOUS
ENTERPRISE
Self-Regulating
WINDMILL

Is recognized as the BEST.

Always gives satisfaction. SIMPLE,
STRONG and DURABLE in all parts.
Solid Wrought iron Crank Shaft
with DOUBLE BEARINGS for the Crank
to work in, all turned and run in ad-
justable babbitted boxes.

Positively Self-Regulating.

With no coil springs, or springs of any kind. No little
rods, joints, levers, or anything of the kind to get out of
order, as such things do. Mills in use 6 to 12 years in
good order now, that have never cost one cent for repairs.
All genuine Enterprise Mills for the Pacific Coast trade
come only through this agency, and none, whether of
the old or latest pattern, are genuine except those bear-
ing the "Enterprise Co." stamp. Look out for this, as
inferior mills are being offered with testimonials applied
to them which were given for ours. Prices to suit the
times. Full particulars free. Best Pumps, Feed Mills,
etc., kept in stock. Address,

S. H. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 13, 1888.

The weather the past week has been of the best for maturing grain. The kernel is filling out. Fruits along the coast want more sunshine. The market for all kinds of produce has been fairly active the past week, if we except grain, which has ruled dull. The Eastern and European markets have tended to lower figures. The following is to-day's cable.

LIVERPOOL, June 13.—Wheat—Good demand for red, while white is depressed. California spot lots, 6s 5d to 6s 8d; off coast 3s 9d@3s; just shipped, 3s 3d; nearly due, 3s; cargoes off coast, more demand at the decline; on passage, buyers hold off; Mark Lane wheat, quieter; wheat on passage to Continent, 577,000 qrs.; wheat and flour on passage to U. K., 2,378,000 qrs.

Foreign Review.

LONDON, June 11.—The *Mark Lane Express* in its weekly review of the British grain trade, says: Native wheats continue in free delivery in London, and the values are sixpence against sellers. The sales of English wheat during the past week were 37,939 qrs. at 31s 8d, against 39,613 qrs. at 35s 4d during the corresponding week of last year. The crop prospects are greatly improving under fine weather. Foreign wheat is slow. Russian and Indian is cheaper. Corn is rather scarce and values are irregular. Oats are sixpence lower. There were 20 arrivals of wheat cargoes. Three cargoes were withdrawn, five remain for orders and 13 are on sale. At to-day's market there was no demand for wheat. The finest English was sixpence lower.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	92½	91½	92½	93½	92½
Friday	92½	91½	92½	93½	92½
Saturday	92½	91½	92½	93½	92½
Monday	94½	91½	91½	92½	92½
Tuesday	92	90½	91½	92½	92½

The closing prices for wheat have been as follows, at Chicago:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	86	85½	85½	85½	84½
Friday	86½	85½	85½	85½	84½
Saturday	86½	85½	85½	85½	84½
Monday	86½	85½	85½	85½	84½
Tuesday	84½	84½	84½	84½	84½

CHICAGO, June 13.—Wheat—84½¢ for cash, 84½¢ for June, 84½¢ for July, 84½¢ for August and 84½¢ for Sept. Corn—53½¢@53½¢ for July.

NEW YORK, June 13.—Wheat—93½¢ for cash, 91½¢@91½¢ for July, 92½¢@92½¢ for August and 92½¢@92½¢ for Sept.

Crop Reports.

WASHINGTON, June 9.—Following is the crop report issued by the Department of Agriculture: There was some reduction in the winter wheat area in some States, though the average breadth of all was but slightly reduced. In the E. St. and South there was no material loss of area from freezing, but in some Western States it was considerable. The apparent reduction of the breadth of winter wheat as compared with that of last year is about 1,700,000 acres; percentage of reduction for the entire winter wheat region is placed at 72 per cent. It is 18 in Illinois, 14 in Ohio, 10 in Michigan and 9 in Indiana. This is in comparison with the reduced area harvested last year. There has been an increased area of spring wheat in Dakota and in the Territories further west, but a decrease in Iowa, Wisconsin and Minnesota, making an average decrease for the spring wheat region of 1 per cent. The area in wheat is apparently slightly below 36,000,000 acres. There is a slight local change in the condition of winter wheat. There is some improvement in New York and Pennsylvania and a marked decline in Missouri and minor changes of status elsewhere, making the average 75.3, against 73.1 in the May acreage. Barley is nearly the same as last year. New York and Wisconsin are credited with an increase of 1 per cent, Minnesota with 2, Dakota with 10; Iowa, Missouri and California report a slight reduction. The condition of barley averages 88. It is only 80 in California.

Fruits.

CHICAGO, June 8.—California made a fine display of fruit to-day. A Washington market dealer received 250 cases of black Oxheart and Goose Plum cherries, 250 cases apricots and 180 cases peaches. The white cherries were among the finest ever seen here.

Wool.

NEW YORK, June 11.—*Bradstreet's* says: The interest in wool centers chiefly in the country, where buyers for Eastern dealers and manufacturers are investing in the new clip very cautiously. Prices throughout the interior are, as usual at this season, above the seaboard level. This, however, does not prevent more or less buying for immediate use. Increasing activity appears at San Antonio and other points in Texas where considerable quantities of eight-months' wool have been sold at 16½¢@16½¢ cents per pound. A more liberal movement is under way in California with range prices from 11 to 17 cents per pound. In Utah something has been done at 12½¢@15 cents per pound. Shearing is in full progress in Ohio and is beginning in Michigan, Montana and Wyoming. Prices are not yet generally established in the States named. In the Northwest buyers are not operating. Prices at London are ½¢@1 cent per pound higher than at the last series of sales. At Philadelphia dullness and weakness are the conspicuous features of the wool trade. There is scarcely any demand from worsted spinners, and inquiry from other consuming interests is very light and unsatisfactory. Sales aggregate 348,000 pounds as against 260,000 pounds last week and 651,000 pounds for the corresponding week of last year.

BOSTON, June 8.—The principal feature in the market this week has been the commencement of operations on a more extensive scale in the new clip of wool in the West. Here the market has con-

tinued flat and unprofitable. The situation does not warrant prices that have been paid in Texas and California. It seems that buying has been confined to two or three dealers as far as Eastern interests are concerned. A majority of dealers here are indifferent to purchasing at prices that are asked. It is now the prevalent idea among the trade that Congress will not settle the tariff question this session, so the coming season, both in wool and woollen goods, promises to be as uncertain as has been the past, and unless dealers move with caution it will prove as unprofitable. The demand for wool here during the week has been confined to small lots. Sales were 1,479,500 lbs. foreign and domestic. Prices were: Ohio and Pennsylvania fleeces, XXX and XX and above, 28@30¢ per lb; Michigan fleeces, 26@27¢; No. 1 Michigan, 30¢; Virginia or Blood fleeces, 25¢; fleeces of various grades, private terms; combing and delaine fleeces, 28@29¢; unwashed combing, 23¢; Territory, 12@21¢; Texas, 10@23¢; Eastern Oregon, 13@16¢; California Spring, 16@18¢; do. Fall, 8@13¢; unwashed fleeces, 18@26¢; super and extra pulled, 20@32¢; scoured, 25@55¢; sundries, 12@15¢; Australia, 37@40¢; Cape, 26@27¢; Carpet, private terms.

California Products at Chicago.

CHICAGO, June 9.—Oranges are in light supply and rule firm with moderate demand as follows: California, bright fruit, ½ box, \$4.50@5; smutty fruit, \$3.50@3.75.

Apricots are only in limited demand. Those from California bring \$2.25@2.75 per 20-lb box.

Sales of peaches are rather slow because the fruit is poor; some, when very poor, has to be closed out at nominal prices. The first shipment of that fruit from California sells fairly well at \$2@2.25 per 20-lb crate.

No nice plums are noticed on sale. Those from California have moderate sale at \$2@2.25 per 20-lb crate when in order.

California dried fruits are rather steady, and they are selling fairly for everything but plums and prunes; these remain dull. We quote: Apricots, sundried, ½ lb, 8@9¢; bleached, prime, 14¢; do., choice, 15¢; do., fancy, 15½¢; evaporated, choice to fancy, 14½¢@16¢; peaches, sun-dried, ½ lb, 9@10½¢; do., evaporated, unpeeled, ½ lb, 14¢; do., evaporated, peeled, ½ lb, 16@20¢; plums, unpeeled, ½ lb, 6@7¢; pitted, 10@11¢; raisins, loose Muscat, 1-crown, ½ box, \$1.35@1.40; do., 3-crown, ½ box, \$1.45@1.50; do., London layers, ½ box, \$2.20@2.25; prunes, small, ½ lb, 6¢; do., fancy, large, 8½¢@9¢.

The weather is becoming somewhat warmer. This is favorable for trade in the hop market. Nothing of special importance is doing yet, but choice hops meet with a fair demand. Pacific Coast, choice, ½ lb, 12@13¢; do., common to prime, 9@11¢.

New California potatoes are slow at \$1.75@2.

Miscellaneous.

NEW YORK, June 11: Recent reports about the new crop of California honey are regarded as untimely.

Brewers are using rather more hops, though as a rule they are giving way in quality. In both State and Pacific the old range holds. There were 517 bales of fire-damaged Pacific sold by auction at from 2@2½¢.

During the week there were displayed nearly 2000 boxes of apricots, peaches, cherries and plums, quoted respectively at \$2.50@3, \$2@3, \$2 and \$2.50. The impression has obtained that Pacific Coast peaches will be abundant. There is plenty of room, if the prices can be made popular. It is a noted fact that the surplus of fresh fruit has stood the auction-room test uncommonly well.

All grades of raisins sell readily, the warm weather considered. Three-crown is quoted firm at \$2.05.

Local Markets.

The closing sales on the San Francisco Call Board were as follows:

Date.	WHEAT.	Buyer Season.	Buyer Year.
Thursday	\$1.57	\$1.49½
Friday	1.47½
Saturday	1.49½
Monday	1.49
Tuesday	1.49½

Date.	BARLEY.	Buyer Season.	Buyer Year.
Thursday	\$1.00½	\$.97½
Friday96
Saturday96½
Monday	1.30½	.94½
Tuesday94½

BAGS—The market ruled dull and in buyers favor throughout the week. The demand from Oregon is disappointing. Calcutta's are quoted at 7½¢@7½¢.

BARLEY—The market has been dull and heavy owing to the fear of heavy receipts soon. Holders of old are generally realizing which tends to demoralize the market. At present low prices, with the consumption very large and crop light it is thought that farmers will be slow sellers. Options have been dull. The following are the sales on to-day's Call.

Morning Session: Buyer 1888—400 tons, 95¢; 300, 94½¢ per cwt. Afternoon Session: Buyer season—100 tons, \$1.04. Buyer 1888—100 tons, 95½¢. Seller 1888, new—100 tons, 86¢; 100, 86½¢ per cwt.

BUTTER—Receipts of fancy are falling off, which causes a stronger market. Good to choice is in good supply. Packing is still continued. The consumption call is good.

CHEESE—The market is steadier with a firmer and stronger tone under lighter receipts and a good demand.

EGGS—The market shaded off some, but at the close it has a steadier and firmer tone.

FLOUR—The market is easier, notwithstanding the shutting down of one of Starr & Co.'s mills owing to disabled machinery.

WHEAT—Cool weather is doing no little in filling out the grain. It now looks as if the crop will be very nearly as large as it was last year—which was a short crop. The demand is slow with buyers bidding down. In options there is nothing new to report. Trading is light with more bears than bulls operating. The following are to-day's sales on Call.

Morning Session: Buyer 1888—1200 tons, \$1.46; 100, \$1.45½; 100, \$1.46½; 200, \$1.46½ per cwt. Afternoon Session: Buyer season—200 tons, \$1.46½ per cwt.

[COMMUNICATED.]
Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco, from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 '86 to June 11, '87.	July 1, '87 to June 9, '88.
Flour, qr. sks.	4,028,049	3,554,897
Wheat, cils.	12,563,149	8,254,323
Barley, cils.	2,216,345	2,263,849
Oats, cils.	133,674	155,584
Potatoes, sks.	822,084	1,089,817
Corn, sks.	118,133	233,446
Rye, sks.	27,574	18,010
Buckwheat, sks.	5,865	3,054
Beans, sks.	438,720	392,272
Bran, sks.	433,385	488,326
Hay, tons.	101,206	114,288
Salt, tons.	22,308	16,810
Wool, bils.	83,186	73,047
Hides, No.	106,804	102,991
Raisins, 20-lb boxes.	138,703	112,266
Quicksilver, flasks.	18,266	29,438
Hops, bils.	13,320	15,918

The receipts of certain articles of produce from Oregon, Washington Territory and other distant points, for the same period, compare as follows:

	July 1, '86 to June 11, '87.	July 1, '87 to June 9, '88.
Flour, sks.	245,242	421,942
Wheat, cils.	992,439	1,181,906
Barley, cils.	6,198	75
Oats, cils.	333,737	272,491
Corn, cils.	117,804	12,590
Wool, bales.	16,587	11,204
Bran, sks.	27,918	68,810
Hops, bales.	801	508
Hides, No.	35,537	31,514
Rye, cils.	5,547
Potatoes, sks.	144,834	82,365

Cereals.

Bradstreet's, June 8, says: The winter-wheat States of Ohio, Indiana, Illinois and Michigan suffered severely from climatic influences, and prospects for a minimum crop are patent. That there has been some improvement in the condition of what escaped winter-killing there cannot be any doubt. The Illinois State report, from returns to May 1, made the average condition of wheat in that State to points above the average of the government report, from returns to April 25. The climatic condition since the beginning of May have been quite generally favorable in all the winter-wheat States. There has been an abundant rainfall, extending quite generally all over the Ohio valley and northward to the great lakes. The temperature has been rather lower most of the time, since the beginning of May, than could have been desired, but still vegetation has made good progress, considering the nature of the season. There has been ploughed up in these States considerable of the area sown to fall wheat. Spring grains take it place. There can be no doubt that this is a clear loss to the aggregate output of the wheat crop; neither can there be any doubt but that the damage to the winter-wheat crop has been greatly exaggerated by numerous reports, largely for speculative purposes. These four States had an output of 132,256,000 bu. in 1887, against 134,751,000 bu. in 1886, 89,196,000 bu. in 1885, and 137,077,000 bu. in 1884, being an average of 123,320,000 bu., or 137,077,000 bu. maximum and 89,196,000 bu. minimum. The output cannot now be forecast. It is not probable that it will go very much below the minimum of 89,200,000 bu., or 34,120,000 bu. below the average crop of the four States for four years, unless climatic conditions are more unfavorable than there is reason to expect. It is reported that Kentucky and Missouri will not have an average wheat crop.

In Hungary there were moderate offerings of wheat, with a good inquiry and a fair amount of business at a slight improvement. The wheat plant was reported weak and patchy. In Austria the condition of wheat had improved, but rye is unpromising. The spring-sown crops have a generally satisfactory appearance.

Australia is making free wheat shipments, and the quantity of wheat now on passage to the United Kingdom (May 18) was 4,456,000 bu. The crop of the four principal colonies is about as follows:

	1887 '88.	1886 '87.	1885 '86.
South Australia	19,012,500 bushels.	10,900,000 bushels.	5,161,666 bushels.
Victoria	13,338,756 bushels.	12,100,036 bushels.	9,170,538 bushels.
New Zealand	5,500,000 bushels.	6,297,638 bushels.	4,242,285 bushels.
New South Wales	4,894,646 bushels.	5,368,844 bushels.	2,768,330 bushels.
Totals	42,545,902 bushels.	35,166,518 bushels.	21,342,819 bushels.

There has been 135,000 tons of wheat exported from South Australia and Victoria from Jan. 1, 1888, to April 6, 1888, 5,040,000 bu.

Belgium's supply of home wheat was small. Buyers are still acting with reserve for both cash and future wheat.

The average price of home-grown English wheat March 24 was 30s. 6d.; April 7, 30s.; April 14, 30s. 3d.; April 21, 30s. 7d.; April 28, 30s. 9d.; May 5, 31s. 2d.; May 12, 31s. 5d.; May 19, 31s. 8d.; May 26, 31s. 6d. The advance from March 24 (30s. 6d.) to May 26 (31s. 6d.) is 1s. 0d., or 3c. per bu. The weather in England is getting warm and crops have good promise, and the price, with free shipments from abroad moving downward, was 2d. off from May 19 to 26.

In South Russia the spring-wheat seeding has been effected under favorable conditions, and is making good progress in its growth.

There are large exports of oats being made from north Russian Baltic ports, which will take the place of Indian corn. The new maize crop of the Argentine Republic is expected to be of good quality, condition generally sound.

On the continent the lateness of the season is causing some apprehension, but not sufficient to advance prices of breadstuffs.

The Indian wheat exports are always largest in June and were, week ended May 26, 1,440,000 bu.

In Germany wheat is firmly held at 38s. level, which is likely to attract Russian supplies. The duty at 10s. per quarter would still leave a price of 28s., and this would probably be sufficient, as England, much further off, only offers 30s. 6d. to 31s. 6d. for ordinary Russian wheat. The growing wheat in Germany is backward, but not so much so as in France. Prices of wheat in Russian markets

have the wide range of 20s. to 26s. per quarter. The price of sound ghika (spring wheat) is about 21s. per quarter in Russian ports of export.

Spanish official statistics for the year 1887 show an increase in the imports of wheat amounting to 165,000,000 pesetas, the total imports of wheat last year having been 314,000,000 kilos (309,360 tons), against 149,000,000 kilos (146,800 tons) in 1886. The imports of flour have also shown a similar increase, viz., 24,000,000 kilos (23,640 tons), against 11,000,000 kilos (10,840 tons) in 1886. These are the preliminary approximate returns.

From Algeria it is reported that the weather has been everything that could be desired for the crops, and that barley cutting will begin the first week of May.

In Morocco heavy rains had fallen, and the wheat crop had good promise.

Oregon advises do not warrant the expectation that the outturn this year in that State and Washington will be larger than in 1886, the severe dry spell having been against the crop. The quantity of old wheat in stock there is greatly reduced by foreign exporting and also free shipping to the port.

In this State the weather has continued favorable for the maturing crop. Although there will be plumper grain, yet there will be a much larger proportion of dark colored, which, of course, is against its shipping quality, and naturally will cause bright, plump wheat to fetch, relatively, better prices. The crop of the State will not equal last year by fully 70,000 tons for export, while Oregon and Washington Territory will fall short from 75,000 to 85,000 tons compared with last year. The large tonnage here and to arrive assures a low range of outward freight throughout the season of 1888-89.

The bears have been talking and bidding down wheat, but with, as yet, little success. The stock of choice old is light. Harvesting is reported to be under way in several of the more advanced counties.

The quantities of flour and wheat shipped from California in the first 11 months of the current cereal year have been as follows:

	Flour.	Wheat.
	Bbls.	Centsals.
July	35,162	920,085
August	41,426	1,638,176
September	67,662	781,888
October	114,379	1,122,921
November	71,587	556,486
December	77,283	882,191
January	71,304	714,057
February	71,527	975,354
March	98,399	900,050
April	52,042	633,465
May	36,049	399,446
Totals	736,770	8,514,119

Reducing flour to wheat, the first combined shipments of flour and wheat for the first 11 months of the cereal year compare as follows:

	Centsals.
1883-84	14,814,700
1884-85	19,354,700
1885-86	13,539,800
1886-87	14,158,100
1887-88	10,724,400

The shipments for May were equivalent to 25,374 tons, and for the first 11 months of the year, 536,221 tons, against 707,906 in the first 11 months of 1886-87.

The harvesting of barley is quite general. The quality is said not to come up to expectations in nearly all sections where harvesting is under way. Receipts the past week were light, but the fear of heavy offerings of new caused dealers to bid down, and even at concessions they bought sparingly. The consumption of feed is very large, but of brewing grades it is light owing to cool weather.

Oats have moved fairly free throughout the week. Heavy receipts on one or two days necessitated some shading in prices to effect quick sales. The crop on the coast will be light.

Corn ruled weak and in buyers' favor throughout the week under more liberal selling offers. Crop advances in this State are uniformly good. At Western centers planting was late but then a larger acreage has been planted.

Feedstuff.

Bran and middlings are strong at a slight advance. The breaking of the machinery in one of Starr & Co.'s mills at Vallejo has curtailed the production. The mill will not be ready for work under eight weeks. The consumption of all kinds of ground feed continues large. The market for ground barley and feed meal is easier.

There is no question but the crop of hay this year will be all of 50 per cent more than in 1887, but this large increase will be offset by the small stock of old and the large and steady increase in the consumption. The consumption this year will be fully 25 per cent more, and may go much higher, than in the season of 1887-88. The fields of wheat, barley and oats that have been cut for hay is unprecedentedly large. Dealers continue to buy sparingly under the impression that farmers will market very freely and cause a break in the market by forced sales.

Fruits.

In reply to J. A. McCune of Watsonville, and several others, the writer will state that the coming fruit crop at the East is off in some spots, but the average will be good. In peaches, will have a big crop; Georgia, Mississippi and Alabama will have no crop, North Carolina about one-half a crop, Maryland and Delaware one of the largest crops ever known. Dealers look for cheap canned peaches and also cheap evaporated, but there will be a scarcity of cheap southern sun-dried. In apples, New York, Michigan, Ohio and Arkansas will have large crops, Indiana and Missouri good crops, North Carolina and Tennessee about half a crop each. My advice do not mean that it is absolutely sure that these States will have these crops. This is the way they promise now, and if they escape tornadoes, dry murrain, earthquakes and foot-rot, drouth, hail storms and summer cholera, they will probably have just this kind of crop.

The receipts of cherries show that the supply is gradually lessening, and they also confirm the advances of a short crop of canning varieties and only a fair average of other kinds. The new bearing trees did not increase the quantity over last year, or, as for that, did not even bring it up to last year. Cherries are generally sold in 8-lb boxes and the quotations given are for 8-lb boxes. Many retail dealers who sell by the pound prefer 10 and 12-lb boxes,

THE BEST DRIER.

FIG. 2.

FIG. 1.

Referring to the accompanying cuts, Fig. 1 represents a longitudinal sketch of largest sized Drier of this kind, having a capacity of 50 tons of grapes. It has 2500 trays placed on 14 cars, occupying a drying chamber 100 feet in length. In this size an exhaust wheel draft is used. It is capable of being reduced in a few minutes to any desirable smaller size, and is therefore adaptable to any emergency as to capacity and use of fuel. When reduced one-half, or less than the normal size, a natural draft is used. The draft is reversible or respirating, passing a part of the time in one direction and a part of the time in the opposite direction, at the will of the operator, as occasion may require. By this operation every individual piece of the fruit or material to be dried, and every side of such piece is exposed to the direct action of the hot air current, and the process of curing, as the term applies, to hay, hops, raisins, tobacco, fish, meats, etc., by this operation, may be readily accomplished. As only a brief description can be given here in connection with Figs. 1 and 2, it may be simply stated that the heating apparatus of the drier is situated underneath the drying chamber, separated by a sheet-iron floor, the walls of the heating chamber being constructed so as to reflect the heat upward, and do not in any perceptible degree absorb heat. The sheet-iron floor radiates whatever heat it receives directly into the drying chamber, but the hot-air current passing swiftly over the heaters and along the flues, carries with it practically all the heat generated by the heaters. The radiators in the drying chamber are closely connected with the heaters, and are so arranged as to make the heaters or the radiators radiate more or less heat, as may be required. The heaters, it will be seen, also have a reversible draft, which is made to correspond with the direction of the flow of the air current in the drying chamber.

In Fig. 1, on line A A, is the drying chamber, divided into spaces for the cars. Two of these spaces show the position of the cars loaded with trays standing within the drying chamber. This is a rear view of the chamber. The cars are moved in and out through apertures on the opposite side (as shown in Fig. 2). On line B B is the heating chamber. The space on line C C shows the exhaust passages connecting with the exhaust chamber at M, where the exhaust is made artificially through the wheel or naturally through the tower E, as may be required. The smoke-return flues, F, F, also terminate in a common upright flue or smokestack, G. In the tower within the smokestack is an exhaust steam pipe, H, used to accelerate the draft in the smokestack and tower when a natural draft only is employed.

On line I, I, is the sheet-iron floor before mentioned. The top of the tower, J, is so constructed that a slight breeze assists the natural draft, and in any case prevents the wind from blowing downward into the smokestack or tower. The radiators are located at K, K, in spaces between the cars at required intervals, and are used to reinforce the hot-air current as fast as it tends to decline. Two of these only are used at a time, the middle one and the one nearest the incoming draft, while the one nearest the outgoing draft is disused. It is not desirable, for obvious reasons, to add heat to the current after it passes the middle of the chamber. Compensation to that part of the chamber is rendered by reversing the draft. The gates for changing the draft are not here referred to by letter, as it will be readily seen that when the draft is

changed, the gates now open will be closed, and those now closed will then be open. The position of the dampers in the connecting flues will also be changed accordingly. The arrows show which way the draft is going at this instant; when the draft is reversed the arrows will all point in the opposite direction.

The heaters, L, L, L, are arranged in pairs, and are from 6 to 10 feet in length by 2 feet in diameter. They are provided with adjustable partitions, so as to cause a greater or less amount of heat to radiate directly or to pass into the radiators. Perfect control of heat is secured in this manner. The engine boiler is placed in the heating chamber beside the heaters, and the boiler flue is connected directly with the middle radiator. Thus it will be seen that every particle of heat generated is utilized.

Fig. 2 shows a sketch of the cross section of the building and its parts. In this figure A represents a side view of the radiator extending across the chamber; B a tray-laden car, drawn out to show position of radiator; C shows a side view of one of the heaters or of the boiler in the heating chamber and its connection with the radiator; M shows rim view of exhaust wheel; N the engine standing on the ground under the fuel shed, which extends the whole length of the building. The belt pulley and shaft of wheel is also shown overhead. The lines P and Q represent the doors regulating the draft artificially through the wheel or naturally through the tower. Their manipulation will be easily understood. O is the receiving room for fruit, extending the whole length of the building. On the floor is a track running lengthwise of the building, on which are run supply cars to supply and relieve the cars in the drier. There are no doors to the openings in the drying chamber, the cars being provided with the ends boarded up, forming shutters at each end, so that when the car stands within or without the chamber the aperture is always closed. The top, bottom and sides of the car are also enclosed by a simple apparatus, so that no matter in what position the car stands, cold air cannot be drawn into the chamber while the car is passing in or out. The cars, no matter how heavily laden, are moved either way readily by one person.

Modifications of the drier, as here represented, will be constructed, ranging from a capacity of 300 to 2500 trays, and costing for the apparatus from \$400 to \$4500, according to size and the quality of trays used. With the best galvanized wire screen trays 3 feet square, engine, wheel, boiler, cars, heater, radiators, flues, and all other apparatus, exclusive of building and labor, putting in apparatus, but including superintendence, a drier of the above description would cost about the latter sum, or with wooden trays about \$2800. The main requirements of the building are a good foundation, good floor and roof. Notwithstanding the fact that this drier, or most of its important improvements, have been and are being patented, the cost of the same is not materially enhanced thereby. Another fact should be well considered, the purchaser not being subject to the cost of experimenting and probable loss by so doing, is perfectly safe in contracting for the purchase of one of these driers, as the proprietor guarantees its proper working, and is responsible for all he contracts to do. HAY PRESSES!

THE HURRICANE—Size A.

A mounted, horizontal double-ender. Size of bale, when in the press, 17x22 40 inches. Average weight of bale, 220 pounds. Capacity, from 16 to 25 tons per day. Uses 4 men and works with 2 horses. Requires no TRAMPING. Puts 10 tons or over in a box car.

Price.....\$1000.

THE HURRICANE—Size B.

Size of bale in press, 22x24x46 inches. Average weight of bale, 260 pounds. Capacity, from 20 to 35 tons per day. Uses 5 men and works with 1 or 2 horses, at option of baler. Requires no TRAMPING. Uses rope or wire. Puts from 7 to 8 tons in a box car.

Price.....\$1000.

The SELF-TRAMPING JUNIOR MONARCH

Size of bale in press, 22x24x46 inches. Average weight of bale, 260 pounds. Capacity, from 15 to 25 tons per day. Uses 3 or 4 men, at option of baler. Works with 1 or 2 horses. Uses rope or wire. Does its own TRAMPING. Puts from 7 to 8 tons in a box car.

Price.....\$500.

THE MONARCH.

Same principle as Junior Monarch, only smaller and heavier. Size of bale, when in press, 17x20x40 inches. Average weight of bale, 220 pounds. Capacity, from 12 to 20 tons per day. Requires 3 men and 2 horses. Uses wire only—rope will not hold. Does its own TRAMPING. Puts 10 tons or over in a box car.

Price.....\$600

THE GENUINE PRICE PETALUMA.

Size of bale in press, 24x24x50 inches. Average weight of bale, 250 pounds. Capacity, from 10 to 18 tons per day. Requires 4 men and 2 horses. Uses rope or wire. Hay has to be tramped in the press. Puts from 5 to 6½ tons in a box car.

Price.....\$350.

THE IMPROVED EAGLE.

Size of bale in press, 26x26x50 inches. Average weight of bale, 235 pounds. Capacity, from 10 to 15 tons per day. Requires 4 men and 2 horses. Uses rope or wire. Hay must be tramped in the press. Puts from 4½ to 5½ tons in a box car.

Price.....\$250.

The above is the finest line of Baling Presses in the United States. They are nearly double the capacity of those of other makers.

Attachment.

WRITE FOR PRICES.

HAS A BREAK PIN TO AVOID ALL
BREAKS OF MACHINE.
BELL RINGS WHEN TO DROP IN
THE PARTITION.

Has a Break-Pin to avoid Breaking of Machine, Steel Pinions on Shaft, Flexible Spring Steel Top Beater; also Automatic Signal Bell, which rings when to drop in Partition block, thereby insuring Bales of uniform length, with the Beater under full control of the operator, who starts and stops it at will, stopping Beater to drop in the blocks, avoiding smashing them to pieces, etc., and the quickly adjusted Continuous Bale Chamber, with self-adjusting Tension Springs, for Hay, Straw, Moss, Cotton, Wool, Excelsior, Paper, etc.

Extra Heavy Steel Wheels with 5-inch Tires on Truck.

Those who are wanting a Belt Power Press, we take great pleasure in calling their attention to our CHAMPION Belt Power Quick Relief Baling Press, of which the accompanying cut is a fair representation.

In constructing and perfecting this Belt Press, we have earnestly endeavored to and have succeeded in overcoming all the objectionable features and defects, and to construct a Belt Power Press that would meet all the requirements of those who were wanting a Baling Press of large capacity that could be run with small power engine and be strictly portable.

In constructing the power for the CHAMPION Belt Press, we have made it simple, and with strength ample to stand all that may be required of it. Being constructed on scientific principles that have been thoroughly tested, there is no liability of its getting out of order or breaking. The driving gears and shafts all run in one solid iron frame-work, all in running order is hung into press (like putting clock-work into case), making it impossible for the gear to get out of running order. The Shafts are the best of Steel, with good bearings, reducing the friction to a minimum. The power itself is entirely unlike any power ever before used in a Baling Press. The beater is driven by a toggle, the toggle in turn being driven by a Pitman connected to the driving gear. The toggle and driving gear are

set with such relation to one another that it requires two-thirds of the revolution of the large driving gear to push beater in, while the remaining one-third of the revolution pulls beater out; or, in other words, the beater travels twice as fast when being pulled out that it does when pressing a charge, or going in. By using two-thirds of the revolution of the driving gear to push the beater in (or press a charge) causes the beater to travel fast while material is loose, but as the density of the material increases the speed of the beater diminishes, hence power increases. This exerts great force on the material being pressed, which is a very essential point and one well worth considering. Using, as said, only one-third of the revolution of the driving gear to pull the beater out, withdraws the beater so quickly after the charge is pressed that it entirely escapes the rebounding of the material pressed. Thus the danger of the gear being broken by the "back lash," caused by the "rebound force" of the pressed material is entirely overcome.

If you have not received our No. 14 (1888) Catalogue, write for it. Mailed free to any address.

Cut Showing Champion Belt Power Press with Bale Weighing Attachment.

The heavy CHAMPION Belt Power Continuous Quick Relief Portable Baling Press is warranted to be of good material, well made, and if properly set up and operated, is capable of pressing one and a half to three tons per hour, and power plenty to load 10 to 15 tons in a car. Or, in other words, the CHAMPION is guaranteed to press more in any given time and more efficiently, with less danger of breaks, than any other Belt Power Press in America.

BALE WEIGHING ATTACHMENT.

By the use of same, each bale can be weighed accurately as it passes out of the Press (see cut above), which is very desirable when wanting the correct weight of each bale. Being attached to Press, is always ready and no trouble to move it about as is the case when using a platform scale, yet it is just as correct (warranted).

Handsome Yearlings.

If there is anything that pleases the fancy and wins the affection of the stockman it is the handsome youngsters of his herd. Young animals, not excluding the blessed babies of our households, are usually more handsome in their early days than ever afterward, and all mankind has liking and sympathy for nature in its springtime. To the stock-breeder, however, there is in the young animal something more than merely the beauty and playfulness which commend it to the common observer. He sees the promise of development of points which he is endeavoring to develop or perpetuate in form or other characteristics of the animal. He scans the youngster to see how rapidly he is advancing toward his ideal, and he perhaps looks forward to the distribution of desirable points throughout his herd. Naturally the young stock receives his best care and attention both for their present characteristics and for the future which may be wrapped up in them.

In some such way we imagine Mr. Martin Flynn of Des Moines, Iowa, looks upon the group of yearling Shorthorns of which we give a picture on this page. He has a Bates herd of over a hundred, which he proposes to make one of the best in his State. His animals are representatives of several of the best-known and most popular families, such as Kirklevington, Barrington, Wild Eyes, Fennell Dutchess, Rose of Sharon, etc. At the head of the herd is the 33d Duke of Airdrie 50833, whose calves prove him to be a superior sire. Mr. Flynn is very much pleased by the uniform excellence of the get of this bull, and is fully satisfied that his purchase of him at a high price was a very good investment. On this page we have pictures of three highly bred yearlings in the "Walnut Hill Herd," 2d Duke of Walnut Hill, Lady Wild Eyes and 2d Duchess of Walnut Hill. They are handsome specimens, and Mr. Flynn is quite proud of them.

The cruiser Charleston will not be ready for launching on July 4th, as it was intended she should be.

SERICULTURE.—Affairs at the State Board of Silk Culture seem to be in a highly satisfactory condition. Their two large rooms in the Flood building are tenanted by over 50,000 worms, at various stages of development, a great number of which are spinning busily. Large quantities of cocoons are sent in from time to time for reeling by persons—mostly women—who have engaged in raising worms in various parts of the State, and letters are received, almost

SUN-DRYING AT MARYSVILLE.—The *Appeal* says that the fruit-drying department of the Marysville cannery, which is the enterprise of G. A. Fleming & Co., employs at present about 50 boys, and the management are desirous of securing a number of girls. This is all piece-work, and up to the present all have made pretty fair wages. Many boys go out after school hours and earn from 25 to 50 cents each. The drying is all by the sun, and though they

Fruit Shipping.

The Eastern shipment of fruit has proceeded with unusual vigor, and far more fruit has gone forward early in the season than ever before. It really looks as though the Eastern people were getting educated to the desirability of the apricot faster than has been thought possible, and between the Eastern demand and the surety of a good return from drying, the canners have to bid pretty good prices for what they need. This is as it should be all around. Brisk competition between the different outlets for the fruit will reward the growers and help on the fruit interest of the State generally.

The California Fruit Union has sent East something like 40 cars so far this year. Mr. Hatch, who has just returned from a flying Eastern trip, is reported to have said at the meeting of the State Board of Trade on Tuesday that there is most excellent outlook for sales of fruit East. The first two cars sold for \$2350 apiece. The first sale of fruit at auction in Chicago was set for June 21st. The demand for California fruit is very promising. Mr. Hatch visited many towns of 5000 and 10,000 inhabitants where California fruit had

never been heard of. Shipments East thus far have been nearly twice as much as any season in the same period, and the sales have aggregated larger amounts. This is a very encouraging group of facts. By next week the arrangements for the season's work will be more definitely known.

HORTICULTURAL ORGANIZATION IN SOUTHERN CALIFORNIA.—It was telegraphed from Pomona, Los Angeles county, on Wednesday of this week, that many representative citizens had arrived to attend the convention to effect an organization to be known as the Southern California Board of Horticulture, which was called to meet in Pomona, Thursday. The organization comprises the counties of Santa Barbara, San Bernardino and Los Angeles. It was announced that money necessary to the extent of \$20,000 had already been advanced to aid the association. We go to press too early to get further information about the movement.

YEARLING SHORTHORNS—2D DUKE OF WALNUT HILL, LADY WILD EYES AND 2D DUCHESS OF WALNUT HILL.

every day, from those desirous of learning how to start in the business. All applicants may obtain printed instructions, as well as silkworm eggs, mulberry leaves and cuttings. The supply of trees at the board's disposal is exhausted, but the applications held over will be filled from the large stock of trees to be procured for next season.

THE FRUIT CONTRACTS.—We understand that A. Lusk & Co. took two of the fruit contracts made by the J. Lusk Canning Company, and the other contracts have been distributed among other canners. In a few cases we believe changes were made in the contracts, with consent of the fruit-growers, but as a general thing the contracts are assumed about as they were originally drawn.

CATTLE in the mountains, says the *Sonora Independent*, are doing famously this year, and all the stockman has to do is to smile and watch the dollars pile up under their hides,

have been working but three days, they have about 15 tons out on the trays in the yard. "It is very noticeable," said one of the men who is employed there, "that the boys who do not play make very good wages, while those who do are dissatisfied."

ANOTHER FRUIT ASSOCIATION.—Announcement is made of the formation of an association at Sacramento to be known as "The Growers' and Shippers' Association." The association is composed of the Earl Fruit Co., Sacramento; Wood & Co., Sacramento; C. W. Reed, Sacramento; Geo. D. Kellogg, Newcastle. The association is organized upon a mutual contract for the purpose of shipping trainloads of fruit when fruit is abundant, so as to get transportation to market on the most favorable terms. C. W. Reed is to be the Eastern agent.

RIPE TOKAY and Muscatel grapes were reported in the Yuma markets June 13th.

ARBORICULTURE.

Osage Orange Hedge.

EDITORS PRESS:—Permit one who has had 40 years of experience with the Osage Orange as a hedge and fence plant, and who, during that length of time has had many miles of it under his care continuously in North Central Illinois, to give his unprejudiced opinion on it as a farm hedge, or fence or wind break in this State. I will preface my remarks by saying that in Illinois the general and mature judgment of good farmers is against it as a cheap, reliable, and efficient hedge plant.

This is not for the reason that a good fence, or a most beautiful and perfect hedge cannot there be formed from it, but simply for the reason that it requires too much labor to care for it, and because such labor must be performed at the busiest and most disagreeable times of year, namely in winter and midsummer.

The plant is a tree. In the rich soil and moist climate of the prairie States it grows with great vigor, therefore requires much labor to keep it cut back, and if not kept trimmed within bounds it soon becomes a great nuisance.

Besides the tree is an enormous feeder, having wide spreading surface-feeding roots, therefore requiring a wide fence row, for crops are starved if near it. But if it is closely kept in hedge form, sheared back twice or thrice during summer, it does not require so much room and makes one of the most perfect and handsome hedges of any deciduous plant, and also a very cheap and permanent one. It is not being planted very largely of late years in the prairie States, where it has been the most experimented with.

But many of the objections against it in the prairie States will not apply here in California. For here its rate of growth can be in a great measure controlled by the supply of water. There is more leisure and more agreeable weather in winter to trim and shear it.

The tree is indigenous in Southern Arkansas, Louisiana, and Western Texas. Its foliage and thorns resemble those of the common orange quite closely, except the thorns are shorter, stouter and sharper. The tree belongs to the bread fruit family, and is a distant relative of the mulberry. The tree, when grown singly, is round top and spreading. When grown closely in groves, quite upright and straight.

Its wood is dark yellow or reddish brown, very hard, exceedingly elastic, hence its French name in Louisiana, *Bois de Arc*—bow wood—it being used above all other woods by the Indians for their bows. The wood is very hard, fine grained, taking a high polish, of great strength. One of the most lasting of woods; it may be said that like red cedar it never decays, nor does the wood shrink, swell or bruise; when used for the felloes of wagons, the tires seldom need setting. In fact it is the most valuable tree for its wood alone, especially for all the uses of the farm that a hard wood is needed for, that can be grown on the continent. As a wood for fuel, green or dry, so far as I know, it is unequalled by any wood. The tree grows very fast on a deep rich soil with plenty of moisture.

How to Plant for a Hedge.

As a hedge plant, as said before, it has its faults. To make a hedge of it, after 35 years experience and observation, I would say, procure the best obtainable plants, one year old. They can be had East by the carload packed for \$1 per thousand. Prepare the hedge row by plowing it very deeply six to eight feet wide; plant the plants in a straight line six to eight inches apart.

In this climate, at any time during winter, but where there is danger of freezing not until early spring, the plants should be planted in and the soil packed very firmly to them, one to two inches deeper than they grew; cultivate thoroughly and give them plenty of water. The first spring the plants should be cut to within four inches of the ground, and some plants should have been planted the spring before, to be now taken up to fill in any vacancies. The hedge row should be well cultivated the second and third summer, the second spring cut back to 16 inches in height and the third to two feet. After the third season it will need no further cultivation.

By the fall after the third spring one should have a hedge that will turn any kind of stock, and be very unpleasant for fruit thieves to get over or through. The fourth spring it should be cut back to 3½ to 4 feet and cut back to four feet in height every winter thereafter. This yearly cutting is all that is necessary for a lasting perfect hedge, but one may shear it during summer to any desired form or shape, just as the Monterey cypress is here done. A good hedge or fence can be made from this tree in a hundred other ways. But the above is the plan I should follow did I want a good hedge of it here. The plants may be planted one, two, three or even four feet apart, and a good hedge or fence be formed from them. But close planting seems, all things considered, the best. The main objects to be gained by close planting are not to rank a growth and not too great a space being left by the failure of a plant.

If an Osage hedge is left without continuous yearly cutting back, the more vigorous plants will over-shoot the weaker and kill them out. There is nothing gained by wide planting and plashing, as bending down is termed, the whole

hedge row, the plants, costing but little. But a gap in a line of hedge can be filled up in that way better than by planting anew in the gap. This may be done in many different ways, by bending down the trees next the gap and layering in their branches, or bending them flat to the ground and fastening them there, etc.

The Osage orange is one of the most valuable timber trees that can be planted in California. It is true it has many thorns and very sharp ones, but it has so many uses, especially here where hard, tough, elastic woods are so scarce. For tool handles, pins, wedges, and nearly every use a hard wood is put to, it is unsurpassed.

[Wood of the Osage orange has already been used in this State for buggy hubs, etc.—Eds. PRESS.]

THE DAIRY.

A Tulare Cheese Dairy.

The *Traver Advocate* gives the following description of a new undertaking in the dairy line in Tulare county:

The Excelsior stock farm, seven miles southwest of Traver, D. C. Hayward proprietor, is about to become the scene of cheese-making operations. Last Monday afternoon the editor of this paper made a visit to the farm to witness the preparations. The 800 acres of land which Mr. Hayward owns is all under the People's ditch, which flows directly through his main ranch, its broad stream of water, 26 feet wide at the ranch, bidding defiance to dry years and drouth. Most of the farm is devoted to alfalfa, on which browse hundreds of cattle and horses, while a part of the ground is reserved for hay and one-quarter section for grain. The grain, which lies detached from the main farm and nearly adjoining the Excelsior school-house, is as fine as could be produced anywhere in any season. But all the crops in that vicinity are first-class, the ground being seepy and the innumerable ditches which meander through it furnishing an abundance of water all the year round. Mr. H. states that if he turns the water into a low place on his farm, it will rise to near the surface in other parts of it.

The Excelsior stock farm is tightly fenced and cross-fenced. A beautiful cottage, built on a natural knoll, commands a view of the surrounding country and is a delightful home. To the left of the house are numerous corrals, stables, a creamery, etc., while in the rear a young orchard spreads its green leaves and sends out its handsome fruit to ripen in the sun.

The cheesehouse, which has just been erected near the residence, is evidently built with a view to permanency, cleanliness and our climatic conditions. It is 18x30 feet in size. The walls are double and filled with sawdust. A cement floor has been laid, over an inch in thickness, with a slant toward one side, so that all fluids which may fall upon it will drain off. The house is supplied with windows, which furnish an abundance of light, while screens keep out all insects. It is but 20 yards from the cheesehouse to the new stable which is being built for milking purposes.

This building is 24x46 feet in size, with stalls for 25 cattle. It is built for cleanliness in milking. Any person who has ever milked cows in a corral will see the advantages of Mr. Hayward's stall method. The building is floored, with mangers on each side of the building. There is a walk through between the rows of stalls, with a gutter on each side, having a decided slant, which carries off all manure, etc. The cows are driven, 25 at a time, into the building, and immediately commence eating. To reach the feed they must put their heads through between a movable bar and a fixed bar. The milker passes along and throws the movable bar toward the fixed bar, securing it with a wooden clamp, and the cow is there for good until the milker releases her. The cattle stand up and eat, and there is no confusion, although they are in a small space, handy for the milker. After the first 25 cattle are milked, they are run out into the field through a corral on the opposite side from where they entered, and another lot is let in.

Mr. Hayward is going into the cheese business on an extensive scale when all arrangements are completed. He will milk 100 cows, making cheese in summer and butter in winter. He is paying attention to raising good milk cows, and has a fine imported Holstein bull, Electioneer, three years old in July, to which he is breeding. Electioneer comes from some of the best stock of milk cows in the world. Mr. Hayward believes that the Holsteins are preferable in his district for milk cows to the Jerseys. Where feed is scarce the Jerseys will keep in better condition and give more milk than any other breed of cattle; but where there is an abundance of feed, as there is on his farm, the Holsteins are the best and will give the most milk.

Mr. Hayward already has a quantity of cheese made up, the heads varying in size from 5 to 45 pounds. We examined them as they lay in the cellar and their appearance would make the mouth of a cheese-loving Dutchman water. One of them, about a month old, we sampled and think it excellent for its age. None of the cheese, however, is at present aged enough to put upon the market, but Mr. H. states that in

a few weeks he will have some sufficiently aged.

With the facilities which the Excelsior stock farm has and is acquiring for cheese-making, and with the pains-taking care which Mr. Hayward takes with his dairying business, we feel satisfied that the farm will soon be turning out as good cheese as is made in California and that another important industry will be added to those already in operation in Tulare county.

THE FIELD.

Sugar vs. Wheat.

From a paper read before Albion Grange No. 23, P. of H., by George Sprague, ex-Secretary of the N. Y. State Grange, we take the following:

There were raised in the United States in the year 1887, in round numbers, 456,000,000 bushels of wheat. There were required for home consumption, say for food, seed and manufacture, 345,000,000 bushels, leaving a surplus available for export of 111,000,000 bushels. We are compelled to find a market for the most of this surplus in Europe, where we are obliged to come into competition with wheat raised by the cheap labor of Russia and India, and upon the cheap lands of Australia. The price that we obtain for this surplus establishes the price for the whole crop, for we have no facilities by which the sale of the crop can be manipulated and marketed, so as to sell the surplus at such prices as can be obtained in foreign markets and at the same time secure for that which is required for home consumption a price that would be profitable to the producer. The whole must be sold indiscriminately at the same prices, and the price at home is fixed by the price abroad.

During the past year the average price of No. 2 red wheat in New York, as given by Bradstreet was 88 1-5 cents per bushel. This is below the cost of production, inclusive of land rent. I observe in one of the statistical reports of the agricultural department that a writer in the *Russian Financial Messenger* estimates the cost of wheat production in the favored black earth regions of Russia at from 45 to 60 copecks per poed, inclusive of land rent. Exclusive of this the estimate is given at from 34 to 50 copecks. Reckoning by the Russian poed of 36 pounds English, the same writer gives the price of production in Germany at 86 copecks; in Hungary, Italy and Rumania, at a little over a rouble; in France at one rouble 46 copecks; in England at 1 rouble 36 copecks; in America at 75 copecks, and in India at 55 copecks per poed. Estimated in United States currency and Winchester bushels, and taking the highest price, viz., 60 copecks per poed for the cost of Russian production, this would give approximately the cost of wheat production in Russia at 75 cents per bushel; in Germany at \$1.08; in Hungary, Italy and Rumania at \$1.25; in France at \$1.82; in England at \$1.70; in America at 93; and in India at 68 cents per bushel. Now, if we deduct from the average price at New York the cost of transportation and commissions, we shall find the average price of wheat at any point throughout the country. In Orleans county the average price for the past year would appear to be about 83 cents per bushel, or about 11 cents per bushel below the estimated average cost of production in America. The average price of cash wheat in Chicago for the past year was very nearly 75 cents per bushel, or about 19 cents per bushel below the average cost of production. Assuming that the average price of wheat in Chicago is a fair average of the prices paid the farmers of the United States for their wheat, and I believe that upon a thorough examination that the average price would be found to be less even than this, we find that the wheat crop of 1887 has actually been sold for \$87,140,000 less than the cost of production. I think I may safely assert that with little or no surplus of wheat for export, the average price of wheat in Chicago for any year would be at least \$1 per bushel. I believe it would be higher, but that or any fair price above the actual cost of production is sufficient for illustration. Now, 345,000,000 bushels of wheat, the amount required for home consumption, would have sold last year if we had raised no surplus for export, for \$345,000,000, while the whole crop of wheat has actually been sold at the average price of 75 cents per bushel, or \$342,000,000, showing a loss upon the crop of \$3,000,000, besides the expense of producing this 111,000,000 bushels surplus—a surplus upon which we have been accustomed to look with so much pride and satisfaction, which, instead of being a blessing, has been to the farmer an injury in disguise, entailing upon his industry an annual loss of over \$100,000,000.

In view of these facts can the American farmer afford to raise surplus wheat for export? Can the American farmer afford to raise wheat with high-priced labor and upon high-priced lands in America, and suffer the price of his whole crop to be fixed in Liverpool at the price of the cheaply raised wheat of Russia, India and Australia? I believe that every intelligent farmer in America will unhesitatingly answer, no. To successfully compete in the foreign markets we must have cheaper labor and cheaper land. Can these be secured? Would it be wise to attempt to secure them? The whole trend of public sentiment in this country is rightly toward a higher plane, and better wages for our laboring population. And this

cannot be changed so long as the laboring people have a free ballot and use it intelligently. Then the all important question arises, how shall this surplus wheat be eliminated from the production of American farmers? Is there any feasible method of curtailing the production of wheat to the demands of home consumption? Can this constantly increasing wheat surplus, which is more dangerous and threatening to the business prosperity of the American farmer than the large and constantly increasing surplus in the United States Treasury is to the business prosperity of the country, be eliminated?

Do I hear some one say that the problem is difficult? I answer, yes. It is more difficult, perhaps, than it would be to dispose of the surplus in the treasury without injuriously disturbing business interests. It is as difficult, perhaps, as is the problem of prohibiting the sales of intoxicating liquors as a beverage. It would not seem to be feasible to attempt to prohibit by law the production of surplus wheat? It would only be another case where prohibition would not prohibit. But, cannot farmers agree among themselves to limit the production of wheat? This could be done if the production of wheat, like iron or coal, was controlled by a few men. But the production of wheat is in the hands of millions of people, and any attempt to control its production by agreement among producers would be entirely impracticable. I can conceive of only one feasible plan by which this imminently dangerous factor in American farm production can be removed. Perhaps others may discover a better solution of the problem than I can. I do not claim or aspire to infallibility. Do you ask for my solution of the problem? I answer, by diverting in a measure the attention and operations of American farmers from wheat-raising to the raising of something that will render a profit upon the cost of production.

The consumption of sugar in the United States for 1887 is placed in round numbers at 1,400,000 tons. The home production is placed at about 200,000 tons, and the amount imported at 1,200,000 tons. This imported sugar at 4½ cents per pound amounts to over \$100,000,000, which the people of the United States send abroad annually for sweetening—an amount just about equal to the loss annually sustained by American farmers by reason of this enormous over-production of wheat. But why cannot our sugar supply be produced at home? By experiments which have been carefully conducted in this country during the past few years, it has been fully demonstrated that by the process of diffusion, the best quality of sugar can be profitably produced from sorghum or amber cane, throughout a very large section of the United States. The most favorable locality for the growth of this cane embraces the great wheat-producing States of Kansas, Missouri, Illinois, Indiana and Ohio, and the States and Territories lying south of them, yet it can be profitably grown in nearly every State in the Union. By a proper encouragement of the sugar industry millions of acres of land that now produce annually over 100,000,000 bushels of wheat, could be diverted into the more profitable avocation of sugar production. This of itself would afford relief ample and complete to the great wheat-growing business of our farmers which is now so ruinously depressed by an uncontrollable, increasing surplus of wheat.

We are accumulating in the United States Treasury a great and bewildering surplus of money, a surplus the disposal of which, without affecting injuriously the great manufacturing and labor interests of the people, is now puzzling the heads of our greatest statesmen—a surplus so large that it is said to be endangering the business prosperity of the country, because it withdraws such a large amount of currency from circulation among the people. From this surplus I would pay annually a bounty of two cents per pound upon all sugar produced in the United States for the next six years—one-half to the farmers who raise the cane and one-half to the manufacturers who make the sugar. After six years I would decrease the bounty, if thought advisable, one-half cent per pound each year, so that the bounty would entirely cease at the end of 10 years. The present tariff on sugar should remain undisturbed. By this plan I would relieve the treasury of its surplus and distribute it where it would afford the greatest benefit to the people. Give the sugar industry this encouragement and you would behold wheat-fields turned into cane-fields, and sugar-mills would spring up as thick as grist mills all over a very large section of this country.

Can encouragement of this kind be secured for the sugar industry? I answer, that that depends mainly upon ourselves. It depends upon whether we will forgo the pleasure of looking after other people's business long enough to take care of our own. So long as we are willing to allow our own chestnuts to remain smoking among the embers, and suffer ourselves to be used in raking other people's chestnuts out from the fire, and act accordingly, I cannot give encouragement that anything will be accomplished for us. "A house divided against itself cannot stand." Before we can accomplish much we must be able to cut ourselves loose from a blind partisan idolatry and become thoroughly united together in mind and purpose and unitedly resolve and unswervingly stand by our resolution; that we will support no man for office who is not in harmony with our interests and purposes, and that we will unitedly endeavor to defeat the nomination and election of every one who is opposed to our interests and purposes, regardless of party politics.

THE VETERINARIAN.

Abortion: Anthrax: Poll Evil.

EDITORS PRESS:—Abortion occurs very frequently in cows. It is a very disagreeable event, as besides the loss of the calf it sometimes occasions the loss of the mother; and the latter if she survives often remains barren, or at least subject to new abortions. Abortion commonly occurs through want of care, by unsuitable food. Bad air in particular seems to exercise great influence in this respect, for abortion is much more common in low and marshy grounds than elsewhere. It is also liable to be brought about by too frequent sexual intercourse (in this case the generative organ becomes exhausted), also by various injuries, by injudicious use of cathartics, by drinking impure water, by violent coughing, or by the presence of fungi, such as ergot or *ustilago* (rust) on the food; also, by cows mounting each other; it also results from debility, and from nervous influence. When abortion partakes of an enzootic character, it is usually due to the animals being affected with blood disease, especially tuberculosis affecting the genital organs.

Prof. Williams, M. R. C. V. S., refuses to accept the theory of abortion being due to the entrance of a micro-organism into the vagina of a pregnant animal; he considers the spread of abortion a result of influence upon the imagination or upon the blood through the sense of smell.

It has been well established that enzootics of abortion occur more frequently in seasons favorable to the development of fungi.

Abortion seldom takes place suddenly; it is generally announced by several symptoms, among which may be noticed great disturbance, anxiety, sudden diminution of her milk, and the escape from the vagina of a mucous fluid.

If these precursors are noticed we must hasten to prevent it, and there is nothing better than the preparations of aconite. If abortion has taken place, and if the placenta delays in coming away from six to eight hours, it is necessary to use means to aid its removal; give preparations of ergot; we should have recourse to manual interference only in case the ergot fails.

After abortion the animal should be well cared for. It is often necessary to give stimulants and tonics. It is very necessary that the affected animal should be isolated from the other cows. It is also advisable to disinfect the places where abortion occurs. I will conclude by stating that causes which seriously change the constitutional conditions of an animal, when pregnant, may bring about abortion.

Is Anthrax Infectious?

In answer to a subscriber, I can positively state from experience that anthrax is not infectious, that is to say, animals in contact with others which are diseased do not suffer unless some of the blood or tissues of the diseased animals enters their blood. Even eating food containing the germs of the *bacillus anthracis* appears to be insufficient to induce disease unless there are abrasions in the mucous membranes of the digestive organs through which the spores can enter the blood.

What is known as "wool sorters' disease" is said to be really anthrax, and while bales of wool are mainly made up of wool clipped from living sheep in the usual manner, they sometimes contain wool clipped from dead sheep, some of which may have died of anthrax. It only requires a little blood on the wool from a sheep dead of anthrax and a scratch on the finger of the wool-sorter for him to be infected with anthrax. Anthrax cannot be stamped out. Diseased animals die so quickly that nothing would be gained by slaughter, and those in contact with them frequently escape the disease. There is never any real reason for making post mortem examinations in cases of anthrax, because a few drops of blood under the microscope will enable the expert to detect the bacillus. Sometimes an outbreak of anthrax is first discovered by finding an animal dead, but if one of a flock be attacked, it will be found separate from the rest.

Poll Evil.

In answer to a subscriber, poll evil is a term applied to a very painful tumour immediately behind the ears of a horse, at the junction of the head with the neck. It is caused from external violence. This disease is always of a serious character, as not only do the tumours frequently degenerate into ulcers, which are always of a bad character, but also because it frequently happens that the affection involves the muscles, ligaments and bones.

Treatment.—At first the treatment must be antiphlogistic—that is, employ agents which counteract inflammation. When this fails, we must have recourse to counter-irritants—that is, apply agents which stimulate and irritate the skin. If this fails, and the disease has existed for any length of time, and sinuses have formed, so that it is impossible for the pus to gain an exit, but continues to destroy the living parts, it will be necessary to call in the services of a qualified veterinary surgeon, and for him to use the knife freely, so as to cut down in to the diseased parts and to form a depending orifice for the complete evacuation of the matter, without which medical means will be of no avail. DR. A. E. BUZARD, M. R. C. V. S. L.

No. 11 Seventh St. S. F.

HORTICULTURE.

Planting and Pruning the Orange.

From Mr. Lelong's treatise on citrus culture, to which reference was made last week, we take the following on planting and pruning of orange trees.

It is a common practice among growers to place the tree in the hole, fill it up with soil, and then tramp it. As the roots are covered with thick mud they will stick together, and

Fig. 1.—Spreading the Roots.

if the tree grows it will not do as well as when the roots are extended with care. This is very simple. The hole is half-filled with earth, so as to form a mound in the hole, the shovel handle is driven down in the center of the mound, and on being withdrawn a deep hole is left, sufficiently large and deep enough to admit the taproot of the tree; then the roots are spread over the mound (Fig. 1), the soil is lightly pressed. Heavy tramping is not necessary, as the water settles the dirt and keeps the roots in place. Soon after the trees have been watered, and as soon as the water in the basin has

Fig. 2.—An Over-Trimmed Tree.

disappeared, the basin is covered with loose soil; this will protect the tree from getting dry, and also from leaning over. Trees planted with these precautions make the best growth and become the thriftiest.

Pruning.

When trees have been allowed to grow at will for several years before they are pruned, most of the inside brush will be found to be dead, and to remove it requires considerable work and skill, for in removing a branch a

Fig. 3.—High-Trimmed Tree.

hole is made that will allow the hot sun to enter, it will scorch the bark; the fine brush will also die, and diseased trees are sure to be the result. I have often read articles wherein the writers advocate "that the trees be opened so as to allow plenty of air and sun-heat to enter." This advice comes from men having no practical knowledge; men who are ever willing to tell, but who cannot do it themselves. I am sure that no one having an orchard, depending upon that alone for a livelihood, would ever follow or give such advice. It is not practical and should be disregarded.

Fig. 2 is a good illustration of how a tree is

left, or what remains of it, after the brush that protects the trunk and branches is removed. The trunk and inside growth is left exposed to the sun's heat.

I have often seen trees where the bark had been scorched and had dried on the south side of the tree, being the result of removing the brush that protected it.

Fig. 3 illustrates a high trained tree of the same age. In it the lower limbs have been removed, leaving a clear stock, so as to allow the horse in cultivating to pass under its branches, and the cultivator to work the ground close to the trunk.

Fig. 4 illustrates a low trained tree of the same age as Figs. 2 and 3. In this the lower limbs have been allowed to remain to protect its trunk and inner growth. The inside of the tree is kept clear of all dead wood, and no limbs

Fig. 4.—Low-Trimmed Tree.

have been allowed to cross each other, as when two limbs cross each other, if one of them is not removed, both limbs will be cut in two by the friction caused by the wind.

Advantage of Low Trained Trees.

There are several points that should be taken into consideration, i. e.: In summer the trees must be irrigated. If trained high, the sun heat will bake the ground under the trees before it can be worked; as the cultivator cannot run close to the trunk, it must therefore be worked by hand. When trees are trained low, the shade of the branches keeps the ground moist, and in case of the excessive heat, or scarcity of water through the summer, the trees will not suffer; whereas the heat causes the leaves of high trained trees to curl, and if not watered at the proper time, the growth of the fruit is checked. Low trained trees become better balanced, vigorous, healthy, and more productive than when trained high, also become straighter, and the fruit is much more easily and cheaply gathered.

Seedling Fruits.

EDITORS PRESS:—During the present season's growth we have made observations and arrived at conclusions that may be of interest to the readers of the PRESS. We have noticed that some trees were very late in coming into leaf and blossom. Some varieties of apple trees did not put forth their leaves and blossoms until from May 1st, to the 15th. The same was likewise the case with the black walnut, while the white or English walnuts were very early in putting on their garments of leaves and blossoms. The conclusion arrived at is this: That northern varieties of fruit and nut trees, like the apple and black walnut, do not put forth leaf and blossom when transplanted to southern climes any earlier than they do in their northern latitude. This ought to be conclusive evidence that those fruits, nuts and flowers succeed best that originate on the same parallels of latitude, the conditions being equal. During Jefferson's administration the Government furnished the Cherokee Indians—then living in Georgia—with a large amount of apple seeds, and from those apple seeds planted by the Cherokees originated some of the best varieties of apples in the Southern States. This should be an example for California horticulturists, and I notice that some California nurserymen like Leonard Coates of Napa City and O. M. Silva & Son of Newcastle (and many others.—EDS. PRESS) are acting upon the idea and are producing new varieties of fruits from seeds. By planting seeds of the various kinds of fruits that succeed best in California, new varieties will be originated that will be adapted to the soil and climate. In the same way all of the different kinds of fruits that we bud and graft from were produced. Many of the northern fruits are unsuited to the climatic conditions of this State, and the only method to pursue to overcome the defects of existing varieties is to produce varieties from seeds. By following up this line of operation the future of California will show marvels of excellence and beauty in its fruits.

O. F. SHAW.

San Buena Ventura.

THE President has approved the bill introduced in the House by Representative McKenna, appropriating \$150,000 for the building of a public building at Sacramento.

THE APIARY.

Extermination of the Bee Moth.

EDITORS PRESS:—In reply to Mr. Ashley's inquiry, would say that my experience as well that of the leading apiarists demonstrates beyond a question of doubt that Italian and Cyprian bees will protect themselves from depredations of this pest.

In my apiary of 170 colonies there is scarcely a trace of moth to be found in either weak or strong swarm. To those who have common bees I would suggest hybridising as the cheapest and only effectual remedy. By this means you accomplish two results, viz., improve the value of the swarm as honey gatherers, etc., and kill the moth.

For the benefit of the novice will give a few directions how to accomplish this end. To those who have but little time and plenty of money, I would suggest the purchase of thoroughbred queens, introducing them into your colonies after removing the natural queen. It is better to allow the hive to remain queenless several days, say two or three, then introduce the new queen in a cage and let her remain two or three days until the bees come to acknowledge her right of ruling. Be careful to remove all queen cells that may have been started since the removal of the original queen. If you have bought tested queens your bees become thoroughbred at once.

To any one who may wish to pursue a more economical method the process is somewhat complicated, and especially so if you aim to obtain thoroughbred stock all through; and it will require at least two seasons to accomplish the desired result, if the apiary is extensive. Any who undertake the task may, however, rest assured it will amply repay for the work involved.

I will try to briefly outline a plan which has proved successful with many. As a starting point purchase a pure tested queen, a nucleus, or full swarm. Before introducing the queen it is better to remove the bees that have attended her on the journey and provide an ample supply of bee candy or other food else she may starve before being released.

The best method I believe to be starting with a full colony of thoroughbreds, which should be in a hive provided with movable frames. Now, if you have other hives with frames which are interchangeable, take a frame of brood from the new hive and place it in a colony which you have made queenless. The bees will build queen cells upon it. When these cells are ready to hatch, carefully remove all but two, and place them in other queenless colonies to hatch, taking care, of course, that none of the cells built upon the brood of the original queen hatch. Now, these hives that are rearing queens must be provided with uncapped broods or eggs (common brood will do) until the young queen begins to lay. This queen is pure, but her progeny will be as follows: Drones, pure; workers, hybrids. When you have made the round of the apiary, repeat the process and you have thoroughbreds. Some may ask why the drones are pure and workers not. The drone hatches from an egg that has not been fertilized, as the queen lays fertile eggs or otherwise at her pleasure. This young queen having been met in her wedding flight by the common drones, her fertilized eggs produce a cross of the breeds.

In attempting to carry out the suggestions offered, an amateur will doubtless meet with difficulties. As a final suggestion, I would recommend the purchase of a reliable work on bee culture. There are several now offered to the public which will enable almost any one to succeed.

It would be almost impossible in an article, briefly written, to cover all points. We trust this may throw a ray of light to some.

Bakersfield, Cal.

W. A. WEBSTER.

VOLCANIC SYMPTOMS.—A correspondent at Shingletown remarks that a number of small lakes lying around Lassen's peak are reported to have gone dry, as also Honey lake. The latter, however, has been decreasing for years, and went nearly dry last year. An extensive bed of ashes on the side of Lassen has lately become so hot that it is impossible to walk over it. Several witnesses claim that they, some years ago, saw flames near the top of the peak.

BERKSHIRE SALES.—Phil M. Springer, secretary of the American Berkshire Association, sends us account of transfers by Andrew Smith of Redwood City of Redwood Maid 15764; Redwood Sallie IV 17702, and Redwood Susie 17704 to F. W. Atherton, Menlo Park, Cal., and of Carlos 19166 to H. H. Kent, Little River, Cal.

LARGE quantities of potatoes are being shipped to New York from Europe, practically as ballast, the freight paid being very low. The receipts of potatoes from Great Britain and the Continent since October 1st up to Saturday, June 21, were 3,652 089 bushels, against 125,619 bushels for the same period a year ago.

CUT WORMS are reported by Professor Forbes, State Entomologist, to be more numerous in Illinois this year than for many years, and he reports the root-web worm to be doing an immense amount of damage in certain sections of the State.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Temescal Grange.

Last Saturday a rather quiet but exceedingly interesting meeting was held. The Picnic Committee favored the invitation of Bro. A. T. Perkins to hold the Fourth of July picnic in a delightful canyon on the grounds of Mr. H. G. Pratt, Grand Recorder of the A. O. U. W., about a mile and a half above the Hermitage at the end of the Fruitvale railroad from East Oakland. It is a charming place, with deep shade and a pearly stream of water. Those without teams should take the train which leaves Oakland at 9:35 for East Oakland, then street cars to the Hermitage, from whence Bro. Perkins will convey with teams all the ladies and children, if not all of the brethren, to the grounds, which are some distance further up the foothills than Bro. Perkins' fruit farm. Without being any set affair, we have no doubt the occasion will be a very pleasant one. The residence of Joaquin Miller, the "Poet of the Sierras," is near by ex-Patron Pratt's home.

Sister Kinney, formerly resident manager of the Girls' Union, of San Francisco, made some very interesting remarks during the meeting, which were well supported in discussion by other members. Sister Kinney intends going East in a few days, and will visit the interstate picnic in Pennsylvania. We trust she will correspond for the PRESS, as we have no doubt her report of travels and observations will be interesting, encouraging and instructive to our readers. She is an able writer as well as good worker.

San Jose Grange.

On the 9th inst. San Jose Grange again discussed the question of co-operation. Mr. Cressy led the remarks of the members, and maintained his position that it was not so much capital that was needed as unity among the farmers. In support of his statements he cited his experience in establishing the Grangers' banks in Modesto and San Francisco, which had proven to be successful, the stock of the former being now worth 100 per cent premium on the par value.

Messrs. Wingate and Coates followed, stating that the issue rested mainly on capital when a co-operative store was being formed; also that such institutions in the past had not been as successful as was expected.

Mr. Hamilton agreed with Mr. Cressy that the great need was unity, and that if they hoped for any success in the future they must combine.

Messrs. Sanders and Dunn thought that the Grange store would prove of doubtful value, whereas a system of co-operative selling, by which they might unite their efforts in the disposal of their products, would be both of immediate value and of undoubted success. What the farmers need is to combine in a selling enterprise, not a buying one, as the commodities which they produced were much more valuable than what they consumed.

The sentiment of the majority of the Grange seemed to be that the Grange store was not what they wanted, but that the same principle which it was proposed to embody in it could more advantageously be applied to an enterprise for the selling of their fruit, and it is probable that something may be done in that direction.

The Farmers' Congress in Oregon.

A large number of farmers met in the Opera-house at Salem, Oregon, Tuesday, June 12th, in response to a call issued by John Osborn, Vice-President of the National Farmers' Congress, and other citizens, for the purpose of organizing a State Farmers' Congress. Mr. Osborn, having briefly explained the objects of the call, was made temporary chairman and John Minto, temporary secretary.

As stated in the Portland Farmer, the aim is to secure for the farmers, by their thorough organization all over the State, that influence in and over legislative proceedings which is now exercised by other classes and interests through paid lobbyists. In other words, they propose to organize a voting power to demand justice from lawmakers, and put that power against the unlawful agencies which now manage to control legislation against the rights and interests of producers. It is an organization to secure to farmers, irrespective of party, such legislation as the interests of all producers demand. Neither is it a rival nor opponent of the Grange, but as an open organization, all farmers, whether members of the Grange or not, can meet without the restriction of closed doors to discuss their needs and interests.

A permanent organization was effected by

electing the following officers: M. Wilkins of Lane county, president; John Osborn, of Marion county, vice-president; Joseph Gaston of Multnomah county, secretary and treasurer.

Charles Miller, John Minto and John Ferguson were appointed a committee to draft constitution and by-laws and report at the next regular meeting, which was set for Wednesday evening, Sept. 19th, at directors' room, State Fair grounds.

Many had left the hall when a call for membership was made, but the following gentlemen present handed in their names: Lane county—M. Wilkins; Benton—John M. Osborn; Linn—W. R. Kirk, J. J. Graham; Marion—John Osborn, John Minto, Charles Miller, F. M. Rice, J. B. Henninger, W. H. Smith, R. W. Carey, Oliver Jory, J. C. Howd, R. Lee, J. W. Pate, D. M. Morris, S. A. Clarke, Wm. Syphert; Polk—A. W. Lucas, G. T. Waite, John Ferguson, Ben. Windsor, C. Glenn, Cass Riggs, J. B. Stump, James K. Sears; Yamhill—M. Underwood; Clackamas—J. T. Apperson; Multnomah—Joseph Gaston.

If the P. of H. were not already in the field, and in such favor with the agriculturists this new organization might have a better chance for life and usefulness.

OLEOMARGARINE IN MASSACHUSETTS.—Massachusetts farmers demand that oleomargarine shall not be colored like butter. They are willing that oleo should be manufactured and sold for what it is, provided it is not colored yellow, so that it cannot be sold as butter. The lower branch of the Legislature enacted a bill to this effect by an overwhelming vote, but after a prolonged contest it was finally defeated in the Senate by a tie vote. The farmers propose to "knife" at the polls every one of the twenty Senators who went back on them. It is believed that none of these politicians will ever receive a single farmer's vote in future for any office whatsoever. Included in the recreants are both prominent republicans and prominent democrats. This proves what we have so often stated, that both parties cater to farmers merely to get their votes, and after securing them let the farmers' interests suffer. But the farmers are getting their eyes teeth cut, and are learning that, like other people and classes, they must vote for their own interests and not simply for party. This is absolutely the only effectual way for farmers to secure their just deserts. It is politics, but it is genuine politics, not partisan hypocrisy. It is the kind of politics that farmers must go into throughout the country. This broad principle applies to farmers everywhere.—*Farm and Home.*

THE FIGHT AGAINST SLICKENS.—On the 12th inst. an injunction was granted by Judge Keyser, in the Superior Court, against the Butte Creek Mining Company *et al.* The plaintiff is the Leland Stanford, Jr., University, and the complaint alleges that Butte creek has been so filled up by mining debris that the lands of the plaintiff are overflowed and damaged. That to protect the land levees were constructed and channels dug at a cost of \$80,000; that 4500 acres of the lands were converted into valueless willow, cotton and tule swamps, and yielding no income at all. This has now been reclaimed and is under cultivation, but if mining is allowed to continue it will again be rendered worthless. Plaintiff alleges that 700 inches of water is used in washing down the banks and that fully 45 per cent of the earth so washed is carried into the valley by Butte Creek.—*Oroville Register.*

ALHAMBRA GRANGE HARVEST FEAST.—The Harvest Feast at Martinez on the 16th inst. was largely attended. Worthy Master Overhiser was one of the guests. The people of that vicinity are generally much interested in these events and an invitation to be present is always appreciated by the recipient. We hope to receive an account of this meeting at an early date.

Bro. V. W. Still of Auburn, W. M. of Magnolia Grange, lately went with his wife on a visit to Grass Valley. They attended the Grange there, found it apparently prospering, and saw the fourth degree conferred on a brother and a sister. He has also spent several days, this month, canvassing for recruits in that part of the country, finds most of the people favorable and expects soon to organize a Grange at Union schoolhouse and another at Rough and Ready.

THE "TRUSTS."—The *Sutter Farmer* reprints the verses which appeared in our "Home Circle" June 9th, remarking: "Latter-day 'trusts' is one of the most unpoetic subjects imaginable, and yet we found a very good poem in one of our exchanges, which we have transferred to our first page. These trusts are only another name for the most heartless monopolies ever organized; hence any lick at them is in order."

The National Lecturer says: "More new Granges have been organized already this year than in all of last year, and last year had more than in any one year for ten years before."

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

FOR SHADE AND ORNAMENT.—Livermore Herald: The Northern Addition is beginning to look like a young forest. The locusts of last season's planting are making a wonderful growth this summer, while those put out this spring in both the Northern and Southern Additions are getting a good start. Fully 8000 shade trees were planted in the two additions during the two seasons. Many of the mulberry trees set out for shade and ornamental purposes last season are now fruiting. The fruit resembles the blackberry, and is very palatable. The alanthus trees planted this spring, almost without exception, have not so far made a vigorous growth. Those which are growing well are developing into very handsome trees, resembling the date palm in appearance.

VINE LIFTING DEVICE.—P. C. Waltenbaugh of this valley has a contrivance for lifting fallen vines while cultivating or clod-mashing. Two narrow strips of steel are joined at one end, so as to form an angle of about 30 degrees. The other end of one of the strips is then fastened to the cultivator, clod-masher or weed-cutter, in such a way as to allow the lower strip to extend forward from one corner and just escape the ground. The joined ends thus slip under the fallen bunches, and the upper strip gently lifts them, while the cultivator or other implement passes under. Two are used—one on each side. In this way it is possible to stir the soil of our vineyard, and break the capillary tubes throughout the season.

Butte.

OROVILLE HORTICULTURAL SOCIETY.—Register, June 14: Quite a number of fruit-growers were present on Saturday afternoon, and a temporary organization was effected by electing John C. Gray, chairman, and S. S. Boynton, secretary. Messrs. Arents, Rogers and Jackson were appointed a committee to prepare a constitution and by-laws and report at the next meeting, which will be held on Saturday of this week.

THOROUGH CULTIVATION.—Doubtless the most thoroughly cultivated orchard in Butte county is the "Villa Verona," about two miles south of Oroville. The plows and cultivators are almost constantly at work, and the ground is kept as mellow as the soil of a vegetable garden. No sooner has the land been irrigated than teams are set to work, the ditches plowed up, the ground leveled and harrowed, and when water is needed again a new line of ditches is run in a different direction and these in turn are plowed up as soon as used. The trees are making a magnificent growth under the thorough care they are receiving.

Contra Costa.

SEEDLING APRICOTS.—Antioch Ledger, June 9: Mark Walton has placed upon our table a box of apricots, seedlings of the Royal, that are certainly a superior fruit, of fine flavor, good size, and a delightful fragrance. Mr. Walton states that this seedling is ten days earlier than the Royal and that it is equal to that variety in every other particular.

Humboldt.

FROM BEAR RIVER.—Eureka Standard, June 14: Our old-time friend S. W. Morrison, one of the prosperous farmers on Bear river, says there is no room for doubt that the late rains were of immense benefit, especially to late grain crops. To the dairying interest it was also a godsend. The hay crop in his portion of the county will be larger than for some years past. The outlook for butter-makers is favorable. This condition of things will apply generally to the region lying west of Esl river.

Lake.

GLANDERS.—Cor. Clear Lake Press: A petition is in circulation and being signed by every one to check the glanders. Several animals are affected and two have died. The location of the epizootic is 15 miles from Upper Lake.

Los Angeles.

ANAHEIM ITEMS.—Gazette, June 14: Nine swarms of bees, two owls and several hundred pounds of honey have been taken from the Episcopal Church, where bees have lodged for many years. . . . Leonard Parker has a piece of corn that has gone on a boom for itself. It was planted May 7th, been irrigated only once, and now stands from seven to eight feet high and has not been manured. The patch speaks well for the corn-producing soil and climate. Corn can be safely planted to ripen by August 10th, which has been done in this section often.

ORANGE-GROWERS.—At the meeting of orange growers at Kroeger's hall yesterday afternoon by-laws were read and adopted. The following officers were elected: F. A. Korn, president; Theo. Rimpau, vice-president; E. Browning, secretary. Adjourned to Saturday, June 23d.

Mendocino.

A HORTICULTURAL SUCCESS.—Mendocino Beacon, June 9: We accepted an invitation from M. J. Byrnes one day this week and visited his place on the Little Lake road. During the past five years Mr. Byrnes has cleared up about four acres of ground and planted fruit trees of every description, all of which are in a flourishing condition. At present his raspberries are ripening, and from a patch of about a

quarter of an acre he expects to pick a ton of them. We went through the patch ourselves, and have no doubt his figures will be realized. The berries are mostly of the red varieties. Gooseberries and currants seem to do quite as well. He has also some mulberry trees, which are looking fine. Besides these he has set out quite a large orchard. In it are to be found apple, peach, pear, plum, orange, lemon, walnut, cherry, prune, olive and quince trees, all in a healthy condition and doing nicely.

Merced.

ARTESIAN WELL.—Merced Argus: We paid a visit to the artesian well and raisin vineyard on the Galland tract on Sunday for the first time since the completion of the well and planting out of the vineyard, orchard and nurseries, and were surprised at the great change made in so short a time, showing what nature, aided by the judicious application of water and proper cultivation, is capable of producing from the naturally dry soils of this valley. This important enterprise is managed by Messrs. Diew & Richards. The well is a nine-inch bore at the top tapering to six inches at the depth of 600 feet, and its capacity may be imagined from the fact that it has irrigated 30 acres of garden, vineyard and orchard since the well was finished some four or five weeks ago. Most of the vines are rooted and have made satisfactory growth, and the cuttings also promise a fair stand, though the water was late in reaching them.

Modoc.

IRRIGATING CANAL.—Alturas New Era, June 13: E. Lauer of Alturas having acquired about 1200 acres of sagebrush land a few miles north-east of town, in order to make it productive and suitable for settlers found it necessary to bring to it sufficient water for irrigation and conceived the idea of taking water from the river. It was found that the ditch would have to be about 10 miles long, and built high up on the rim rock in order to bring it to the land mentioned at a height sufficient to irrigate it. The surveyed route was in places through immense beds of iron rock and lava. Nothing daunted, Lauer put his men to work, and now, at the end of six months, the work is nearly finished. Last Monday, we visited the scene of operations. We were hardly prepared to see a canal 7 feet wide on top, 5½ feet wide on the bottom and averaging about 3 feet deep, built on a steep mountain-side and in places blasted from solid rock. The work reflects credit on the engineering skill of A. A. Smith, and on Mr. Lauer, whose energy and money made the canal a possibility. Commencing at the upper end of Sigourney's place, the canal follows around the hills, having a fall of from an eighth to half an inch to the rod the entire distance, and ends at a point on the hillside about 2½ miles northeast of town. In places long trestles are built over deep and rocky ravines, while in others immense rocks have been blown out and dirt filled in. The canal will easily carry 2000 inches of water. The work of ditching and reclamation will cost about \$10,000, and when completed the projector can consider himself, in our opinion, about \$30,000 richer.

STOCK-RAISERS.—We learn from the Argus that the annual meeting of the Northern California Stock-Raisers' Association took place at Adin June 4th. Wm. H. Mitchell, John M. Triplets and Albert Gallatin were elected members of the Association. Art. 1, Sec. 2 of the by laws were amended to read as follows: "The officers of this association shall consist of a president, two vice-presidents, secretary, treasurer and an executive committee of 15, of which the president and vice-presidents shall be ex-officio members. Three members of the executive committee shall constitute a quorum for the transaction of business." Officers for the ensuing year are as follows: T. A. Roseberry, Pres.; P. J. Goumaz and J. Thad Jones, V. P.; Geo. H. Knight, Treas.; G. Lapoint, Sec. Executive Committee—Jacob McKisick, Chas. Cramer, J. C. York, L. Knudson, W. Brockman, W. H. Nelson, Elmer Van Loan, T. Renner, J. M. Walker, Geo. Guthrie, W. K. Estill and H. S. Brown. The annual meetings are to be held at Adin, and the quarterly meetings as follows: On the first Saturday of September at Susanville, Lassen Co.; on the first Saturday of December at Fall City, Shasta Co., and on the first Saturday of March, 1889, at Alturas.

Nevada.

PEACHES.—Grass Valley Tidings, June 16: Not over a mile and a half above the Idaho mine Jos. Roberts has a large peach and apple orchard, set out in 1886. Although so young, almost every peach tree this year bears from four to eight large and all but ripe specimens of its fruit. None of the trees are three feet in height and they average less than an inch in diameter. In and around Grass Valley the peach crop this year will be very heavy.

San Diego.

HOT SPRINGS INCUBATION.—Elsinore News: Bundy Bros. have been experimenting in the chicken business, and quite successfully. The blacksmith-shop, owned by them, is situated in the midst of a number of hot sulphur springs. A dozen eggs had been placed in an empty oil can in one of the springs with a continuous temperature of 102°. Three weeks had not elapsed before three little chicks made their appearance, and the shells of all the others but one were cracked. The chicks are apparently healthy. This novel and interesting experiment has proven beyond a doubt the superiority of the waters over the many patent incubators for hatching chickens. No attention is re-

quired, no lamps to be filled and trimmed, nothing to do but put the eggs in and let the heat from the waters hatch them.

PALM VALLEY'S PROGRESS.—*Riverside Press*, June 16: The orange trees in the large 160-acre Navel orchard put out by the company are doing finely, and some of the twigs have grown 28 inches since the trees were planted two months ago. Watermelons and cantaloupes have been ripening since the first of June, but there are few vines planted this year on account of the ditch being completed at so late a date, and as the vines are not protected by fence, the rabbits and coyotes are taking a share of the crop. Muscat grapes are now full grown, and vines from last year's cuttings are filled with grapes and will yield in some instances as much as 50 pounds of grapes to the vine. The water supply in White river is still very abundant, furnishing a ditch full of water and twice as much running to waste as goes into the ditch. The mercury ranges from 90° to 107°. The highest point reached this year has been 113° in the shade.

Placer.

LIVELY LOADING.—*Record-Union*: Saturday evening, at 7 o'clock, the Newcastle Fruit Co. began loading a car of fruit for the East, and at 9 P. M. the cars were loaded, braced, locked and ready for the overland train, which took it out of Newcastle before 10 o'clock P. M. The accomplishment of this work in two hours illustrates the splendid facilities of the place for handling fruit, and it can be pronounced very fast work, as there were 1000 packages of peaches, apricots and plums in the carload. Every box had to be properly placed and securely fastened, so as to stand the jolting of the long overland trip.

Sacramento.

PROPER WHEAT.—*Record-Union*, June 16: There was shown at this office yesterday some Proper wheat from the ranch of George S. Patney on the Cosumnes, which may challenge comparison with any locality. The stalks stand between 6½ and 7 feet high, with stools containing from 6 to 10 heads, which measure from 3½ to 4 inches in length. Crops between this city and Galt show that Sacramento county need not fear a dry winter, as the wheat is fully up to the average in spite of the light rainfall.

San Bernardino.

SAN BERNARDINO CANNERY.—*Index*, June 16: The work of preparing the buildings of the canning company has been about completed, and the company are now ready to proceed with the drying process. A carload of trays were received yesterday and will be followed in a few days by several carloads more. Everything indicates that they will handle a large amount of fruit. Messrs. Burt and Drew, two of the prominent directors, are now in San Francisco, and as soon as they return, perhaps before the canning machinery will be ordered and the business of manufacturing the cans and canning the fruit will then be commenced.

San Joaquin.

FROM THREE GRAINS OF WHEAT.—*Stockton Independent*, June 15: Mrs. G. W. Melone of the Women's Co-operative Bureau yesterday received three bunches of White Australian wheat, grown on the farm of James March, three miles north of this city. These bunches are the product of three grains of wheat, and each bunch has from 80 to 95 well-developed stalks, the heads filled with plump kernels. The samples will be added to the San Joaquin county exhibit in the rooms of the State Board of Trade, S. F.

HARVESTING BEGUN.—*Lockeford Cor. Independent*, June 15: The harvest has commenced in this neighborhood. Lockeford still keeps up her reputation as a grain district. The wheat is above the average, and the farmers are well pleased. Other portions of the county have to brag, but we have the cold facts and the "62½ pounds to the bushel" wheat to show for this place.

San Luis Obispo.

A SPECIMEN TRAMP.—*S. L. O. Tribune*, June 16: A rancher was in town Tuesday looking for help, and stated that he failed to find it at any reasonable price, although he noticed, walking in the streets, a number of laboring men, one of whom approached him and asked for 25 cents with which to secure a meal. Our rancher refused to give up the required coin, and asked the man to go out to the ranch and work for \$40 a month and board, but this the hungry man scornfully refused to do, stating that he preferred to tramp rather than work for such low wages.

Santa Barbara.

PAMPAS PLUMES.—*Santa Barbara Herald*: The indications are that this year's yield will be up to the average, and at the prices offered in advance we should say that those having pampas are happy. A few years ago the crop sold at five cents, and one rancher in the Goleta valley informed us that his profit from a half acre amounted to over \$800. Over \$20,000 will be realized by growers in the Goleta valley this season; while in the vicinity of this city quite as much more will go into the pockets of the fortunate owners of plumes.

MUSTARD AND WORMS.—*Lompoc Record*, June 16: We think we may safely announce that the mustard crop with us will be without profit. There are a few crops that seem to be but little injured by the worms, but the great majority are ruinously affected. Mr. McKay,

the mustard expert, after a thorough examination in different localities, does not hesitate to say that, as a crop, mustard this year is a failure. The worms stay just long enough to do their work well, then go into the ground from two to three inches and come out in a few days changed into millers; these will go to work depositing larvæ. The effect of this year's experience may be to divert our farmers from mustard-growing for a time, not being willing to hazard too much lest this worm become a fixture with us. They are no new thing, however, for more or less of them have been found every year. They are most numerous and destructive in dry seasons, hence the damage to crops this year. . . . The beans are affected only where they are contiguous to mustard from which the worms migrate during the night. This shows that they do not come out of the soil, but must have been produced from larvæ deposited in the mustard. . . . The same kind of worm has been at work in the lower portion of the county on various kinds of crops, flowers and shrubbery, and has done much damage to the potato.

Santa Clara.

ONE WEEK'S CHERRIES.—*San Jose Mercury*, June 16: During the past week the amount of cherries shipped from this city to various points in California, Oregon, Nevada and East, through Wells, Fargo & Co.'s Express, was 80,013 pounds. Of this amount Los Angeles received 27,260 pounds; Pasadena, 5852; San Diego, 7726; Riverside, 2655; Colton, 4618; El Paso, 4311; Ogden, 21,661.

Sonoma.

HOPS.—*Santa Rosa Republican*, June 14: Reports from various sections where hops grow most abundantly, indicate that the yield will be larger than the average. The vines are not yet in bloom, but their vigorous growth and the absence of any of the pests which sometimes blight the prospects are encouraging to hopmen. Captain Guy E. Grosse, who has large interests in growing them, and has observed the present conditions of the crop, says it will be unusually large. The cut worm has made its appearance in but one yard so far as his knowledge extends.

ENGLISH CUCUMBERS.—*Sonoma Index-Tribune*: John Breen, florist and gardener, left on our table this week a couple of English cucumbers, grown on the Buena Vista farm one mile east of town. These cucumbers are a cross between Dickson & Robinson's improved Telegraph and Baldwin's Perfection, and are known as Breen's favorite. They are from 12 to 15 inches long, entirely free from seeds and have a reputation of being superior to any others grown.

Stanislaus.

WHEAT.—*Modesto News*, June 13: The first wheat of the season in Stanislaus county was yesterday put into the Grange Company's warehouse at Salida and to-day the first carload was sent to the city. The wheat was harvested on the ranch of J. G. Elmore, near Salida. The crop yield in this vicinity in most instances will exceed the expectations of the farmers in quality and quantity. . . . We were shown on Saturday a sample of summer-fallowed wheat of the Chili variety, grown on the ranch of F. C. Davis, near Salida, which excels any sample we have seen this season. It has an extraordinary length of head, and contains five kernels to the mesh. The kernels are full and plump. Mr. Davis has 80 acres of this wheat.

IRRIGATION MEETING CALLED.—Arrangements are being made for a monster irrigation meeting at Hill's Ferry on Saturday, June 23d. It is proposed to take the necessary steps toward building a canal from Firebaugh's to Tracy. The proposed canal is to go much nearer the Coast Range mountains than the Miller & Lux ditch. If carried to a successful conclusion, a large tract of land will be opened up.

Tulare.

WATERMELONS IN MARKET.—*Visalia Times*, June 14: Ripe watermelons, from the ranch of Frank Phillips, five miles northeast of this city, were placed on the market yesterday. Mr. P. says he has had ripe melons for at least two weeks.

JACK-RABBITS DIGGING POTATOES.—A gentleman who has a large crop of potatoes growing on his ranch in the Huron country has been forced to gather them early on account of the jack-rabbits having made an onslaught on them. The rabbits visit the patch in the night-time, dig the potatoes out and eat them.

EVERGREEN MILLET.—A sample of "Johnson grass" nine feet and seven inches in height grown without irrigation was brought to town yesterday by I. H. Thomas. It was grown on the Spencer ranch, one mile east of this city, and was only six weeks in obtaining its extraordinary growth from the root. For a year or two Mr. Thomas has been trying to kill it out, as he has no use for it as a fodder supply, but it has been a ceaseless and apparently a fruitless task, as it springs up anew from the least particle of root left in the ground. It is not a desirable grass for stock, and no one now pretends to raise it in these parts.

Yolo.

A NOVEL HEADER.—*Capay Cor. Democrat*, June 13: F. B. Chandler yesterday brought his header and crew from his Elmira ranch to his farm near here. Mr. Chandler's outfit is rather extraordinary. The header is a 12 foot out, with flanges on the wheels and a brake, and is propelled by six large horses; three wagons

with axles eight feet long, large beds, brake and flanges on the wheels, each wagon being drawn by four horses, all abreast, with check-lines so arranged as to draw on each alike. With this outfit Mr. Chandler can cut the deepest and most difficult lands.

COIN IN CUCUMBERS.—*Winters Express*, June 16: J. E. Sackett informed us the other day that he has sold this year \$1200 worth of cucumbers from five acres of land, planted between trees, which is \$240 an acre. He also says that at the present rate they are selling, he will more than double the above figures before the season closes.

Yuba.

NEW BARLEY.—*Marysville Appeal*, June 15: Several loads of newly-harvested barley have been received at the Buckeye mills from Brittan Bros. and William Stafford's farms in Sutter county. It is all of good quality and yielding well to the acre.

OREGON.

CROP NOTES.—*Oregonian*, June 15: R. Scott of Scott's mills says there will be fine crops in Marion county this season. Along the foothills the wheat and oats are the finest he ever saw, a little better than on the prairies, but hay is best about Salem. . . . F. H. Page has lately returned from Southern Oregon, and reports that the young peach orchards growing there are producing very abundantly this year. He estimates the total yield will load 60 cars or 600 tons. There are no large orchards in that vicinity of old growth, and those in bearing have been planted only a few years. Ashland and Rogue River valley have but begun to grow fruit, and this will be the first year when their products will be of sufficient quantity to influence the market. While Rogue river will, no doubt, lead in peach growing, there are peach orchards in this valley and on the Lower Columbia that are producing well this year, besides those grown at Hood river and The Dalles, and above there on the river. This is an unusually productive year for this fruit and from all parts of this valley and Western Oregon generally, the word is that peaches will be fine and abundant. The curl leaf prevails on some varieties but most cultivated kinds are bearing well and will find a quick demand.

NEVADA.

HAY CROP SHORT.—*Reno Gazette*, June 18: From reports from reliable sources in every section, the *Gazette* is in a position to state that not one-half of an average crop of hay will be harvested this season. This means that the farmers of the Truckee Meadows will be called upon to feed nine-tenths of the beef cattle which will be shipped to market from Nevada and the country tributary to it. In the eastern part of the State the hay crop is almost a total failure. In the country south of Carson, notably in the usually prolific valleys of that section, but half an average crop will reward the labors of the tillers of the soil; in Long valley the same state of affairs exist, and in the great feeding valleys of the north—Sierra and Honey Lake valleys—a deplorable lack of hay is announced. This means a high price for hay, and a corresponding increase in the price of beef. Further, the beef supply will be short and but few head of grass-fed cattle will find their way to market. In truth, the fact that heavy losses of cattle will ensue if the winter proves severe stares the cattlemen in the face.

CARE IN THE USE OF INSECTICIDES.—J. S. Finch of Haywards reports injury to cherry and apricot trees from the use of the Ongerth wash. He applied it in February, reducing its strength by four parts of water to one of the wash, and yet it killed his cherries and apricots. He also found it injurious to prune and nectarine trees. On pear trees it did no injury. In the University orchard it was used full strength on pears and apples, with no harm to the trees and with death to the scale. It has also been used ten to one on the plum aphid without injury to the trees, but when used stronger it has dropped part of the leaves and fruit. The lesson with this and with other insecticides should be to use it with care and not to infer that what will be good for one kind of tree will be good on another.

NEWSPAPERS BETTER THAN PAMPHLETS.—At a meeting of the Fresno Board of Trade, a few days ago, Mr. M. J. Church said he was convinced that distributing pamphlets, in hopes of attracting land-buyers and settlers is folly. He took pamphlets with him on his recent Eastern trip, but found that people did not believe what they read in them—that they wanted reliable newspapers. "If we are going to make ourselves known, we must do it through truthful articles in responsible periodicals. Pamphlets don't amount to anything."

POSTOFFICES have been established at Dehesia, San Diego county, with M. J. Gregg, postmaster, and at Steel Swamp, Modoc county, with J. Frank Reynolds as postmaster.

A FRIENDLY WORD.—Mr. H. of Santa Barbara, renewing his subscription, adds: "We all appreciate the *RURAL* and cannot do without it."

The school census of San Francisco was so badly taken this year that the work is to be done all over again.

News in Brief.

THE Hotel Del Monte has been formally opened.

GENERAL SHERIDAN continues to improve in health.

THE Northern Pacific train was robbed near Billings, M. T., on Sunday last.

A DESTRUCTIVE fire occurred at Kingman, A. T., on Sunday. Loss, \$50,000.

ACTIVE preparations are going on for celebrating the 4th of July in this city.

TELEGRAPHIC communication has been established between San Diego and Ensenada.

SAVAGE & SON, foundry men, who have been in business here for many years, have assigned.

MERCED citizens held a meeting Saturday to discuss and devise means to improve the county.

A REHEARING of the case of Goldenson, who murdered Mamie Kelly, has been denied by the Supreme Court.

SCRAP TIN from the canneries is now used in the Portland Reduction Works as a flux for desulphurizing ore.

GENERAL LOGAN's remains will soon be transferred to the grounds of the Soldier's Home near Washington.

THE grand concert to be given at the pavilion during the Educational Convention promises to be a great success.

THE St. Nicholas hotel, San Diego, was burned Saturday night. There are suspicions that it was set on fire.

THE United States Local Inspectors decide that the San Pablo was lost by strong currents, and exonerate the ship's officers.

A CAR with 600 lobsters is on the way to the Pacific Coast from Massachusetts. About 200,000 eggs for hatching at San Francisco accompany the lobsters.

THE lawyer who persuaded Teller Scott to steal \$150,000 of the Manhattan bank funds has been sentenced to nine years and eight months in the State Prison.

THE Santa Paula *Chronicle* reports the shipment of 184 tank cars of oil from that place during the month of May, the largest shipment ever made in one month.

SELMA, Fresno county, which recently had a bad fire, experienced a second one on Monday. The half of the block left from the previous fire was burned by the second one.

THE building of the Cogswell Polytechnic college, Twenty-sixth and Folsom streets, is almost completed. The first session for the reception of students will be held on Monday, Aug. 6th.

THE Denver Cattle Trust has closed a contract with the French Government to supply the French army with 150,000 head of beef cattle annually. The cattle will be all range stock.

THE deer in the northern part of Sonoma county have never been known to be so scarce as they are this year. Campers and "sportsmen" are killing the females, and even the young fawns.

ED. PATTERSON a well-known rancher near Gridley, Butte county, was on Monday caught in the main wheel of a combined harvester and crushed to death. He was a single man and aged about 40 years.

An Ingenious Device for Picking Prunes.

George A. Fleming, a San Jose fruit drier, has given the *Mercury* some interesting facts concerning prunes and prune culture. He gathers the fruit from the trees in the following manner: "A neighbor, once in a discourse lately, remarked to me that foreign prunes, picked and handled at a price far below what we had to pay, would eventually kill the prune industry in California. I jokingly replied that I intended to make a machine to pick prunes, and what commenced in jest ended in fact. The idea took hold of me, and before I got home I had conceived an arrangement by which prune-picking would be wonderfully facilitated. It is a simple machine, consisting merely of a very low platform wagon with a sideboard on one side. Boxes are arranged on the platform, and to the opposite side of the sideboard two sheets of cloth 8x16 are attached. The wagon is drawn by one horse, and when opposite a tree two men, one for each sheet, spread them under, one each side the trunk of a tree, and standing on the outer ends of the cloths gently shake the tree. When all the prunes ripe enough have fallen the two men gather up the sheets, commencing at the outer extremity, and dump the prunes over into the boxes, with sheets on top. The advantages of this simple contrivance are many. For instance, last year in a large orchard near Saratoga, where the trees bore only a half crop, a boy and a man averaged from four to five tons per day, costing us actually 75 cents per ton for picking. It saves handling the boxes, which are heavy, so often, and keeps out the dust which necessarily gets shifted into the prunes when handled in the old way." Prunes in all cases are dipped in lie and thoroughly rinsed. This is done to crack the skin, which hastens the process of drying in one-half the time, otherwise in many cases the fruit would ferment. All fruits are liable to injury by the "sweating" process if not perfectly cured. Thoroughly matured fruit without irrigation produces a better quality of dried than irrigated fruit. Irrigated fruit shrinks more and contains less sugar than non-irrigated fruit. All fruits shrink more or less by the process of evaporation. It takes about three pounds of fresh prunes to make one pound of dried.

Incomplete.

[Written for the RURAL PRESS by MAUDE S. PRASLER.]

I think the words that are sweetest,
Are the words that are never said;
And the moments that pass the fleetest,
Are the last ones with the dead.

The thoughts that are truest and bravest,
Are the ones that are never expressed;
And the tender love thou cravest,
For fear is never confessed.

I know the friends that are truest,
Are those we know in our dreams;
Though we feel the one who is newest,
Is very near what he seems.

The rose that is sweetest and fairest,
Is the bud that is killed by the frost;
And the love that is dearest and rarest,
Is the true love we just have lost.

Grammatical Errors in Writing.

[Written for the RURAL PRESS by CHAS. P. NETTLETON.]

The spelling in the following article, except in the quotations, is in accordance with the joint rules of the Philological Society of England and the American Philological Association:

To the observing reader it is surprising how many grammatical mistakes are made, even by experienced writers, in the use of the English language. Many, perhaps most, are the result of carelessness, the writers really knowing better, but not paying sufficient attention to the revision of their manuscript to avoid flagrant blunders.

One rule many persons need to remember is that a writer should so construct his sentences that the meaning he wishes to convey not only may be clear to the reader but shall be clear, for our language so often allows the words in a sentence to be transposed that without great care two meanings will be conveyed, confusing and annoying the reader. Whatever other faults the best writers may be found guilty of, for it is said mistakes exist in the writings of even the masters, this of confusing the reader by two or more possible meanings in one sentence is never found, while with persons unaccustomed to composition it is perhaps the most common of all blunders.

We all make mistakes of some kind, and because I point out certain ones I notice, think not I consider myself free from all mistakes.

For a short time I have been taking note of the blunders, inconsistencies, etc., I have come across in reading, and am surprised to see people so apparently ignorant of syntax or so careless that frequently they say what they do not mean. Newspaper advertisements present a fruitful field for the critic, since many advertisements are written by persons unaccustomed to "writing for the press." Take this I clip from a daily paper:

"Just arrived at our barn from Nevada, corner Turk and Steiner streets 25 fine horses, for single and double harness from 4 to 6 years old."

Strange horses, indeed, that should be adapted for none other harness than that "from 4 to 6 years old." Yet that is what is said and that only, no matter what was intended.

It is said that in sum parts of France, for the purpose of guaranteeing pure milk cows are driven thru the streets from house to house and milked as customers require, but a certain advertiser wants his cow even more handy than that, to judge from the following advertisement actually printed in a San Francisco daily:

"Wanted—By the 1st of April a house of six rooms and bath with place for a cow, in East Oakland," etc. Perhaps the man was lazy and wanted the cow in the dining-room.

In an advertisement of the Michigan Central Railroad, the following specimen of pathos is found:

"So long as the waters of that mighty river thunder down to the awful depths below, so long as the rush and roar, the surge and foam and prismatic spray of nature's cataract masterpiece remain, to delight and awe the human soul, thousands and tens of thousands of beauty-lovers and grandeur-worshippers will journey over the only railroad from which it can be seen."

Sum things are inexcusable, and one of these is for an author on such a subject as grammar to lay down rules and then violate them himself. Prof. Townsend has done this in his "Art of Speech." In Vol. 1, page 112, he gives this rule:

"The pronouns former, latter, either and neither signify one of two persons or things; therefore they should not be used for the first, the last, any one or no one, because these last signify one of three or more persons or things," and explains it by an illustration. Yet on page 124 the author himself, at the beginning of a chapter, uses the following language:

"After discussing the general laws of speech, together with its diction, idiom, syntax and grammatical rules, there still remains a quality which neither one of these topics covers; that quality is denominated style."

In the above quotation neither one refers to

the four topics he has just mentioned, and thus he clearly violates a rule written by himself.

Prof. William Cleaver Wilkinson can write well, but when, as in his "Greek and Latin Courses in English," he writes for as he supposes the ignorant because common people, he is unnecessarily strained and awkward, not to say ungrammatical. I have heard this remark by several fellow-Chautauqua students, but as he violates few rules except those of clearness and brevity, I find it hard to seize on anything that most people would call poor writing. However, take these two examples, as illustrative of what he is capable of doing. Speaking of Plato's philosophy he says: "Swedenborg, with his system of correspondences derives no doubt, from Plato. 'That is, to express in clearer terms what Prof. Wilkinson says, Swedenborg does not derive doubt from Plato; what he meant to say can readily be seen by placing commas after 'derives' and 'doubt' in the sentence he used."

The other example is this sentence from the preface to his "College Latin Course in English:

"The preparation of this series of books has happened to coincide in time with vivid public discussion, experiencing its irregularly periodic revival among us, of the question whether after all classical culture ought not to be regarded now as a thing that has had its day."

We may without involving a contradiction of terms say of things that they are nearly perfect and half full, but when a man says that something is "irregularly periodic" he evidently needs allopathic doses of rhetoric.

A writer in a certain weekly paper, speaking of God, says: "He who gives can only take." She could have easily transferred the words to say what she meant, which clearly is, He only who gives can take.

A doctor of divinity known to me writes as follows, in a religious paper, reporting what Mr. Sam Jones said of himself:

"In college he first learned the pleasure of sinful ways, and he kept on the downward road until he was admitted to the bar! That is bad; I had not thought as lawyers are so very depraved a class as we must necessarily infer from the wording of that sentence. But then, it seems that even a lawyer can change his ways."

Ignorance of the fact that as years pass words change in spelling led a newspaper correspondent to once say: "A common characteristic of early New England graveyard literature is bad spelling."

Dr. J. H. Gladstone of England speaks of a student who said in reply to a question in his examination paper: "Chaucer was a writer who deserved some merit, but unfortunately he could not spell." The correspondent spoken of above, if not that student, was at least capable of calling Chaucer the poorest speller of all acknowledged authors.

In the course of an editorial in the New York Independent, the writer once used the following mysterious language:

"We must sail under the guidance of this star, or our thoughts will be stranded on a shoreless sea."

A certain magazine speaking of "The Mystery of Edwin Drood," says: "This story was to have been published in 12 monthly parts, but one-third of the work only had been issued at the time of Mr. Dickens' death. One-third more was left in manuscript, the remaining half of the story was left to be written." It would have been better to say: The remainder of the story was left to be written, and not leave us under the necessity of supposing that story would have consisted of three and one-half thirds!

Thomas Dunn English, speaking of a certain person, was once guilty of the following slip: "He don't know friend from foe." The English writer James Payn, considered one of the greatest of living novelists, and editor of a London paper, said recently in the New York Independent: "There was once a newspaper called, I think, the Imperialist, published in America, which advocated the monarchical principle for a year or two, but it was not a financial success. The phrases 'advocated the monarchical principle for a year or two,' and advocated for a year or two the monarchical principle, convey two entirely different meanings, and it would have been just as easy for him to say what he meant."

In the report of a certain divorce case the following astonishing statement was made:

Mr. and Mrs. Emmons, the lawyer said, were married on August 8, 1876, in London, in the presence of only a few relatives. As far as known then, and as far as is yet known, Mrs. Emmons never had a relative.

A certain very bad poetical license that almost destroys the effect of the poem is found in "Curfew Shall not Ring To-night." The girl pleads with the sexton and he hears her, although the poem says she spoke in a whisper:

"And her lips grew strangely white
As she breathed the husky whisper,
Curfew must not ring to-night."

But when she at the risk of her life keeps the bell from ringing, we are told that the sexton is deaf and, unconscious that the bell is not ringing, pulls the rope the usual length of time. These are the words:

"And the sexton at the bell-rope, old and deaf
Heard not the bell,
But he thought it still was ringing."

That girl must have had a fog-horn voice to make the sexton hear a whisper when he was

too deaf to know whether the bell he was trying to ring was ringing or not.

The following is from that little manual entitled "Don't," which has had such a sale at home and abroad:

"Don't play the accordion, the violin, the piano, or any other musical instrument to excess. Your neighbors have nerves, and need at times a little relief from inflictions of the kind. If you could manage not to play on musical instruments at all, unless you are an accomplished performer, so much the better."

That last sentence is even worse than to tell a person not to go into the water till he can swim.

Sum of these instances of poor and careless writing that I have quoted may be thought by some person not bad enough to need mention, but we must remember it is our duty to not only keep the English language from becoming more corrupt than it is, but also to purify it from existing evils. Not a quotation have I given but is either inelegant or grammatically wrong. It is incumbent on each person who writes to be careful and precise in the use of words and to specially note that not more meanings than one are conveyed. Yet care must be taken that the very endeavor to make sentences clear do not in itself so confuse the mind of the reader that he is doubtful as to the meaning intended.

Accustom your mind to seeing all around a sentence at a glance, to transposing words while reading, in order to see if they can be better arranged, and to placing yourself in the position of hearer and criticizing from his standpoint. Read your writings to a friend or aloud for your own benefit, for many times the ear will discover mistakes that the eye alone would not. Great pains should be taken to avoid errors, for, depend on it, blemishes detract much from the force as well as from the beauty of writing.

Haywards, Cal.

The Cook Wagon—A Query.

[Written for the RURAL PRESS by I. H.]

Who was the originator of the Cook wagon? In the long hot summer days whenever I see a thrashing outfit passing along the dusty road, the odd-looking narrow house on wheels bringing up the rear, I mentally make my obeisance to him as a public benefactor.

One has only to look back a few years to realize the great revolution worked by this very simple invention.

"The threshers are coming!" The very words sent a thrill of dismay through the household, and not without cause. Eighteen or 20 men coming into any house to be provided with three meals a day would rather upset the orderly routine of daily life; but when they came, as they often did to a farm where there was one woman with her hands already full of work and two or three little children clinging to her skirts, the visitation became a nightmare.

I have heard it argued by those who had never tried it that after all it was no great matter to cook for a few additional men for a short time. But I think no woman who has gone through the experience will agree with them.

Nowhere in the world do people work longer hours than in California during the thrashing season. With the earliest dawn breakfast must be ready for the men, which means, of course, that the cook should be up and at work an hour earlier. What if she were a woman not over-strong and with a baby at her breast? All day long she must be in and out of the hot kitchen baking and boiling, washing dishes, pots and kettles; and not until darkness compelled the workers in the field to stop would they come in to supper. Afterward when the men were all locked in slumber she was still at work over the endless dishwashing far into the hours when she should have been at rest. Is this an overdrawn picture? Possibly it is, for California men are notably kind and helpful—all honor to them for it! Few of them would refuse to assist in the home at such a time, and doubtless they generally lifted part of the burdens on their own shoulders. Nevertheless the chief care and the largest share of the work necessarily fell to the house-wife, and it was to her an era to be marked in letters of gold when the cook-wagon made its first appearance.

Now the long procession comes lumbering in at the gate, the huge engine, the separator, the derrick, and in the farm-house there is no disturbance of the family life. All goes on as usual. Perhaps there are visitors from the city, and after breakfast the ladies put on their hats and go over to look at the great machine eating up the immense stacks and pouring out the golden grain. It is an interest, a pleasure and a recreation, the time that used to be an anxiety and a dread. Over there under the shade of an oak tree stands the cook-wagon which has wrought the change. Look in and you will generally find everything neat and orderly, while a Chinaman in a white apron is busily peeling potatoes and baking bread. Every inch of space is utilized, the seats for the men are boxes, and on raising the lid you see where the stores are kept and the cups and plates packed away while the house is in transit.

The invention was one of those bright ideas which might have come to any one, so simple, so sensible and so reasonable it now appears. But to whom did it first come and who deserves the credit?

Some Spanish Proverbs.

[Written for the RURAL PRESS by D. M. D.]

America's great philosopher-poet, Emerson, once said that "Proverbs, like the sacred books of each nation are the sanctuary of the intuitions." Webster's simpler definition is, "A statement without qualification, explanation, or contradiction."

The classic age of Spanish literature belongs to the sixteenth and seventeenth centuries, but the collection of sentences and apophthegms in that language dates back to the last half of the thirteenth century. The *Proverbios Buenos* may be regarded as one of the successes of Mediaeval literary effort. The morals and the theology of the times were wrapped in these short sayings. They belong especially to the Castilian division of Spain, and they were given to the world at a period when wars in Sicily and Sardinia and court luxuries and jealousies might be most unfavorable to literature. We have had pen-pictures of the country from which these proverbs came, its beautiful Bay of Cadiz, its rocky Gibraltar, and its inland forests of oak, cork and olive trees have been well described. We have its middle age history, full of contentions with neighboring powers, and squabbles about princely successions. We have the account of independent principalities, relations with Rome, and the Crusades. We have its modern history, of factions and States united by the marriage of Ferdinand and Isabella, followed by the reigns of later kings and more recent wars—a story which belongs more to Europe than to Spain.

Every people in every age has had its bits of truth done up in short sentences. We have the Proverbs of Solomon, which is the book of Wisdom. They were given for the instruction of the people, and consist of two-line maxims of a miscellaneous character, vigorously expressed, and very practical and pointed. They are rich in comparisons and relate to the life and conduct of mankind.

The forcible, sententious sayings of a people are handed down from generation to generation in these proverbs. The observations and intuitions of uncultured races are thus preserved. There are many proverbs which are common to all languages; but we select such as are best known in the Spanish. That tongue abounds in proverbial forms of expression.

"*Contra fortuna no vale arte ninguna.*" There is no fence against fortune—a comfortable conclusion.

"*La mentira tiene las piernas cortas.*" A lie has short legs—so it cannot travel fast or far, and may soon be overtaken by the truth.

"*Mucho en el suelo poco en el cielo.*" Much on earth, little in heaven—a statement which is discouraging to the few and comforting to the multitude, if it may be read backward.

"*No ay cerradura si es de oro la ganza.*" There is no lock but a golden key will open it—a sentiment which reflects upon human integrity.

"*Un cabello hace sombra.*" The least hair makes a shadow—a short sermon on the importance of trifles.

"*Viento y ventura poco dura.*" Wind and good luck are seldom lasting—therefore we will take our successes modestly.

"*Calzo qui muchas libras leventa ninguna mala.*" He who undertakes many things at once seldom succeeds in any—practical counsel on the subject of losing oneself in a sea of little efforts.

"*Juego de manos es de villanos.*" Rude play is used only by low-bred people—and with this plea in favor of politeness we close this list of Spanish proverbs.

OUR TEARS.—Tears in redundancy may strikingly express emotion, but that is a mental side, which is but a small part of their function, as we shall see. The principal element in the composition of a tear is, as may be readily supposed, water. The other elements are salt, soda, phosphate of lime, phosphate of soda and mucus, each in small proportions. A dried tear seen through a microscope of good average power presents a peculiar appearance. The water, after evaporation, leaves behind it the saline ingredients which amalgamate and form themselves into lengthened cross lines and look like a number of minute fish bones. The tears are secreted in what are called the "lacrimal glands," situated over the eyeball and underneath the lid. The contents of these glands are carried along and under the inner surface of the eyelids by means of six or seven very fine channels, and are discharged a little above the cartilage supporting the lid. The discharge of tears from the lacrimal gland is not occasional and accidental, as is commonly supposed, but continuous. It goes on both day and night—though less abundantly at night—through the "conduits," and spreads equally over the surface of the pupil, in virtue of the incessant movement of the lids. After serving its purpose the flow is carried away by two little drains situated in that corner of each eye nearest the nose—into which they run—and called the "lacrimal points." The usefulness of this quiet flow of tears to both men and beasts, is manifest. There is such an immense quantity of fine dust floating in the air and constantly getting in the eyes, that, but for it, they would soon become choked. Very little is requisite to keep the ball free, and when some obnoxious substance—smoke, an insect, or the like, that affects the nerves—does make its way in, an increased flow is poured out to sweep it away.—*Ex.*

"Dare to Be True."

I was calling upon an acquaintance not long since, a lady of refinement and culture, whose society is always a pleasure to me. We had not been talking long when the servants ushered another caller into the parlor, a richly-dressed, elegant-looking woman, and one who had traveled extensively. She was a delightful conversationalist, being a person of large observation and knowing the world like a book. There was a vivacity about her that was charming, a brilliancy of wit that continually sparkled in her chat, and a vivid power of description that was enchanting.

But with all these excellent powers she was an inveterate gossip, and one whom, while she smiled upon you, you felt was regarding you with a critical eye, and if the slightest occasion offered would be ready to attack you with unenvied tongue. As she entered, my hostess rose to greet her with a pleasant smile, saying, as she extended her hand: "My dear Mrs. B., I am delighted to see you. Have a seat. Take this easy chair and tell us about your trip abroad." Mrs. B. did as desired, and, leaning back at her ease, commenced the story of her trip, intersecting here and there some caustic remarks about various people whom she had met and had been thrown into contact with. She tore them to pieces, metaphorically speaking, until, as my friend said, there were only a few shreds of character left, and those had such a touch of doubt about them, you felt that she might as flush of shame stole over her face. "Mother will be very careful never to do so again."

"Susan," she said, as the little one left the apartment. "I realize what a dreadful example I have set my child this morning. How could I ever rebuke her for falsehood now? This fashionable lying—yes, that is what it is, and I may as well call it by its right name—is just as culpable as any other form of falsehood, but strange to say, I never considered it before."

"I am afraid that many mothers, conscientious, Christian mothers, teach their children to be untruthful and insincere in just this way," I replied. "These little students of human character are alert and quick to see such shortcomings, and to pattern after them, well have destroyed those with the rest."

When she left us we both of us naturally breathed more freely, and my hostess exclaimed: "Susan, that woman is a terror to me. I dread to see her coming. I always feel as if she were here to murder me and lay me out on the dissecting table. I've no doubt but she will go away and pick me all to pieces, just as she did the people whom she described to us this morning." "Why, mamma!" exclaimed her young daughter, "you told her you were delighted to see her." "Well, mamma should not have said that, dear," replied the mother, with a pained look upon her face. "Was it a lie, mamma?" persisted this little student of human nature. "I am afraid that it was a thoughtless untruth, my child," replied the parent, while a quick, hot for what mother does, they think cannot be so very wrong."

"Of this I am sure," said my friend, humbly. "I shall be very careful hereafter to guard against any repetition of this fault. 'Was it a lie, mamma?' It seems as if those words would ring in my ears forever." And the tears of sorrow filled that mother's eyes, for she was a good, true woman, abhorring whatever is false and deceitful. Will not other mothers regard this?—*Susan Sunshine in Los Angeles Times.*

THE CIVILIZING POTATO.—The potato has been a great civilizer. It commenced its work 300 years ago as a native American, and it has gone all over the world, doing its work in all lands quietly yet steadily, and in two ways—first, by being so cheap and abundant that everybody came to like it; next, by failing until everybody missed it and went to hunting all over the world for it. In 1880 this country produced about 170,000,000 bushels of potatoes. To-day we are importing potatoes from Germany, Belgium, Scotland, England, Ireland. Our potato crop failed in a great degree last year because of drought in the West and long continuous rains in the East. Hence, we are importing potatoes and paying a duty of 15 cents per bushel on them besides freight. If there been a total failure of the potato crop we would have ransacked the world for them, for now we must have them however high they come. This shows how the potato has become a civilizer. We are short 20,000,000 of bushels, and must call on the world to make up that shortage. Generally, England is short on potatoes. Luckily this year she and all Europe have a surplus. Next year the situation may be reversed. Ireland ran out of potatoes in 1847, and commenced starving until we supplied her. Six years ago we had a great failure, and Ireland supplied us. But the year before that England and Ireland had to import potatoes. So the potato appears and disappears, to teach the world mutual dependence. The original potato still flourishes in an island off Chili, a gnarled and diminutive tribe, the ancestor of a long and prolific and beneficent line.—*Exchange.*

A WOMAN'S INVENTION.—Vanderbilt paid Miss May Tillinghast \$30,000 for inventing a new kind of tapestry hanging for his house.

YOUNG HOLKS' COLUMN.

Mowed In.

"Capital, Al. Now for your story, Fred."

Four members of the Bicycle Tourists' Club were relating their adventures of the past season, and the one last addressed, a tall handsome athlete, laughed slightly as he knocked the ashes from his cigar before replying.

"A droller adventure than mine, boys, never happened. There's the pathetic, the ludicrous, the tragic, the sentimental, all combined in this story of mine, and it's true, every word of it. It happened, let me see, just six weeks ago to-day."

"I went with Clark and Anderson, you know, up to Bethlehem, from there to the White mountains, then to Lancaster."

"Now just before starting mother said to me coaxingly:

"If you go as far as Lancaster, do not forget that Janet Harding, the only cousin I have in the world, lives in the next town."

"All right," I replied. "Janet Harding lives in the next town to Lancaster. I'll remember."

"Janet Harding unmarried would have been bad enough, but with a husband, two giddy girls and an overgrown boy of seventeen, could I stand it? Mother thought I could, and mother rules our house."

"When we started on our bicycle trip to Dixville Notch I planned to see the Hardings, bowl leisurely up to the door, introduce myself to Mrs. H., joke with the girls and then proceed; but man proposes, etc."

"As luck would have it, my bicycle broke down, and I had to leave it at the Falls, a little village five miles from Lancaster, for repairs. Clark and Anderson went on without me to North Stratford, where I was to meet them by train, and I proceeded on foot to the Harding farm, some two miles from the Falls."

"The farm, a smooth interval dotted with fields of ripening grain, and the large verandah house and great roomy barns clustering about it, but not too near, all bespoke plenty, comfort and hospitality."

"Hospitality, did I say? Well, I shan't take it back, although I found the door locked and not a living thing in sight except an old white hen. Mark the exception, for that hen plays an important part in my adventure."

"I noticed her, and in particular marked the proud, complacent step, the conceited 'car-car' she uttered, as she looked at me knowingly from the corner of her eye. Little did I think—but no matter. You will see by-and-by the golden thread that binds all the points together."

"Well, here we were, the white hen and I, but Janet Harding was not, nor the girls, nor the boy, nor Mr. Harding."

"I decided to go to the barn and lie down on the hay—the new-mown hay—and await their coming."

"For me to think is to act. A few minutes later I had climbed to the mow and ensconced myself under a brace in the corner where the afternoon sun glistened through a long crack, making slanting dust-beams across my breast."

"I made a few verses as I lay on the fragrant hay, but I didn't poetize long. I fell asleep, and I dreamed, and my dreams grew thicker and blacker and heavier, until at last I dreamed that Janet Harding and her whole family were seated on my stomach, and oh, the pressure! I groaned and waked myself up, but I wasn't much better off then, for Egyptian darkness reigned about me, except for the crack where the light still sifted through."

"Where was I? What was the matter? I couldn't think, the horrible pressure was so maddening. All about, around, above, was packed piles of oats, not shelled oats, you know, but oats before they are thrashed, on the stock, or whatever you call it. While I was asleep I had been mowed in, and that's all there was to it, except that I couldn't move hand or foot. Two or three loads must have been thrown on top of me, trod down, and clinched, so to speak."

"Well, I tumbled around a bit and got my hands free and poked the grain away from my face a little. It was in a corner, as I told you, under a brace, and this gave me a chance for my life, that and the crack which gave me a breath of air in the hot, stifling place. I was just as effectually immured as were the monks in olden times when they were walled up in their living tombs, for no amount of strength served to lift the burden a particle."

"By and by something fluttered at my feet and rose up and cackled."

"It was the white hen."

"I knew her and she knew me, but bless you, she didn't want anything of me nor my company. I could see that. But she couldn't get out? Oh! but couldn't she? She cocked her head impudently to one side, stepped daintily to a tiny aperture about half as big as her head, and I saw at a glance that she meant business. The less sense the more instinct; I saw that the creature would get out somehow."

"Why not use her for a carrier pigeon and thus establish communication with the outside world? I shouldn't care to die here and be pitched out to the cattle by forkfuls, or put through a threshing machine, although I might deserve such treatment, and I couldn't get out myself."

"I tore a leaf from my notebook and wrote something like this:

"Come to my rescue. I am buried fathoms deep in oats, northwest corner of the barn, just opposite the house. My blue necktie is thrust through the crack. Perhaps you can see it. I am mowed in. Your relative,

"FRED INGERSOLL."

"I tied the note to the hen securely with a portion of the necktie, the rest fluttered from the barn, and Biddy stepped forth, 'one foot up, the other foot down,' carefully, conscientiously, as a hen does, and by and by a faint rustling spoke hopefully of her progress to my waiting heart. Meanwhile I was a prey to anxious thoughts."

"Suppose she should never reach the light, but perish in her perilous journey, become hemmed in and unable to go any farther; suppose she should lose the letter in her passage—but a triumphant cackle assured me that the white hen had reached the barn floor, and blessed sight! a little later I saw her through the crack walking proudly away from the door with the letter plainly in view."

"Just then two young ladies drove into the yard. Pretty? Well, I guess so. You don't often see handsomer girls than Janet Harding's. One was dressed in seal brown and the other in navy blue."

"Do look at that hen!" cried Seal Brown. "I do believe it's a billet-doux from your William. If it is, now, I'll clap my hands hard, just so, and I'll say, 'Billy, do send me one, too.'"

"One, two; and it will take two to satisfy you?" said Navy Blue, laughing at her sister's saucy face."

"They lured the hen toward them with a handful of corn. Seal Brown swooped down, and loosened the letter and read it."

"I saw all this through a crack in the barn, and heard them make merry over the distress of their city cousin."

"Well, to make a long story short, the girls dug me out, for the men were in the meadow after more oats. It seems that they were in a great hurry to get at the oats, and the hired man mowed away. Probably the first forkful covered me, and that was doubtless put on without looking. Nobody knew just how it came about. When I came to view I did the best and the only thing I could do. I laughed and the girls laughed. It was a ludicrous introduction to the family, but it served its turn. I found the girls no less charming than pretty; Harry, a fine lad, home from college; Mrs. Harding, a lady in every sense of the word, and Mr. Harding, shrewd, corpulent and good-natured; and that is all."

GOOD HEALTH.

THEATER AIR.—An interesting account has been given by Cosmo J. Burton of the amount of carbonic acid and organic matter in the Theater Royal and the Royal Lyceum theater in Edinburgh. At the time of the experiments the theaters were by no means full, nevertheless the temperature was from 10 to 15 degrees above that record immediately before the houses were opened, while carbonic acid was multiplied from three to five times. Mr. Burton remarks that the vitiation of the air proceeds with extraordinary rapidity at first, but the rate of change soon decreases till toward the end of the performance the air becomes little or no worse, and, indeed, in a few instances, it appeared to slightly improve. The air of the gallery was worse than that of any other part of the house; the amphitheater, dress circle and pit did not come in the same order as to degree of impurity in the experiments, but the pit was always worse than the dress circle. Headache and vertigo are produced when the amount of carbonic acid in the air of respiration is not more than from 15 to 30 volumes per 10,000. The facts as to all theaters ought to be known, for the public had much better lose an evening's enjoyment than submit to the enforced inhalation of a polluted atmosphere for a number of hours.—*London Lancet.*

THE BANANA AS FOOD.—According to one authority, one pound of bananas contains more nutriment than three pounds of meal or as many pounds of potatoes, while as food it is in every sense superior to the wheat bread. Although it grows spontaneously throughout the tropics, when cultivated its yield is prodigious, for an acre of ground planted with bananas will return as much food material as 33 acres of wheat, or over 100 acres of potatoes. It is not generally understood that bananas—fried, baked or roasted—are very appetizing, and that, sliced and placed in a dish with alternate slices of orange, they make a most delicious desert. In the West Indies, where they are grown in profusion, as elsewhere, they are much esteemed as food, and being easily obtained nearly all the year round, they are justly looked upon as being a great dainty by the natives."

THE USES OF THE EUCALYPTUS TREE.—The uses to which the products of the eucalyptus trees are put are annually becoming more varied and valuable. A very good cement is now made from the gum of the trees and is being introduced in the local market. From the leaves and tender branches there is compressed a substance used largely by engineers in steam boilers for the prevention of scale. Then, too, the nuts or acorns are, by powerful pressure,

made to give forth an oil of which many medicinal preparations are made, chiefly liniments, salves and lotions. A local manufacturer of rustic furniture for arbors, summer houses and ornamental grounds says he finds the limbs of the old trees and the trunks of the young ones especially adapted to the purposes of his trade."

REDUCING FLESH.—Every physician has his own idea as to the best method of reducing flesh. Bismark, once very stout, reduced himself according to the Schwenninger method. The plan consisted essentially in dry diet. He was not allowed to drink anything during meals nor for two hours and a half afterward. At the expiration of that time he was allowed to drink freely. By that time his food was digested and the fluids were readily absorbed and carried to the kidneys, and served to wash out the system. Schwenninger also restricts the patient to one food at a time in case of extreme obesity. For instance, if he should take meat he could have nothing but meat. If he took bread nothing but bread, and so with potatoes or anything he chose."

NOT AN INFALLIBLE TEST.—A "test for sewer gas" has been going the rounds of the papers which deserves notice on account of its misleading character. It consists in exposing to the suspected atmosphere pieces of paper moistened with a solution of sugar of lead, which are supposed to indicate the presence of the dreaded gas by turning black. This test is entirely unreliable, and only indicates the presence of sulphureted hydrogen, a very disagreeable gas, but not especially dangerous in small quantities. There is no definite test for sewer gas known, and it is much better to avoid all possibility of its presence than to depend upon any chemical tests for indications of its existence."

DOMESTIC ECONOMY.

WAFFLES.—One pint of sweet milk, two eggs, one pint of flour, one-half cup of butter, one teaspoonful of cream of tartar, one-half teaspoonful of soda, a pinch of salt. Bake in waffle-irons, well heated."

GINGER POUND CAKE.—Three cups of flour, one cup of molasses, one cup of buttermilk, one-half cup of butter, two teaspoonfuls of saleratus, two teaspoonfuls of cinnamon, one teaspoonful of ginger and two eggs."

LEMON JELLY.—Made the same way as orange jelly, only using six lemons and the rind of one; serve quite white, and add a gill of Buccellas or any very pale wine. Calt's foot stock, reduced and clarified, may be used instead of the isinglass or gelatine."

SEYMOUR PUDDING.—One-half cup of molasses, half-cup of milk, half-cup of raisins, seeded and cut in halves, half-cup of currants, half-cup of suet, powdered, half-teaspoonful of soda, one egg, 1½ cups of graham flour, spice and salt to taste. Boil or steam for 2½ hours."

GRAHAM BREAD.—Take twice as much graham as white flour, two teacupfuls of the former and one each of white flour, sour milk and molasses, or less of the latter if not liked pretty sweet, and one teaspoonful each of salt and soda. Mix well; pour the mixture into a buttered pan and steam two hours."

TAPIOCA FRUIT PUDDING.—One-half cupful of tapioca soaked over night in one quart of cold water. In the morning cover the bottom of a baking-dish with any kind of fruit, either canned or fresh, sweeten the tapioca with one-half cupful of sugar, add a little salt and nutmeg, pour over the fruit and bake one hour. Serve with sauce."

SALLY LUNN.—Sift into a pan 1½ pounds of flour; make a hole in the middle and put in two ounces of butter melted in one pint of warm, not hot, milk, one tablespoonful of salt, three well-beaten eggs and half a teacupful of yeast. Beat well, pour into well-greased tin pans, and set aside to raise. When light, bake in a moderate oven."

WELSH RAREBIT.—Half a pound of English cheese, three egg well beaten, one scant cup of fine bread crumbs, three tablespoonfuls of butter, melted, two teaspoonfuls of made mustard, one saltspoonful of salt; mix all well together and beat to a smooth paste; have ready some slices of toasted bread, from which the crust has been pared; spread them thickly with the mixture, and set them upon the upper grating of the oven until they are slightly browned. Serve at once."

FRICASSEE OF FOWL.—Divide a fowl into eight pieces, wash it well, put the pieces into a stewpan and cover with boiling water, and one teaspoonful of prepared seasoning; let it boil 20 minutes, pass the stock through a sieve into a basin; take out the pieces of fowl, trim nicely, then put into another stewpan two ounces of butter, with which mix a good spoonful of flour; moisten with stock, put in the pieces of fowl, stir occasionally until boiling, skim well, add 20 button onions; let simmer until the onions are tender, then add a gill of cream, with which you have mixed the yolks of two eggs, stir in quickly over the fire, but do not let it boil; take out the pieces, dress in pyramid on dish and serve. If you require to warm up the remainder of the above, put it into a basin which stand in a stewpan in which you have placed a little warm water; put the cover over and let it boil gently, by which means the contents of the basin will get warm without turning the sauce; when hot dish up and serve."

The Week.

Correspondents seem to lack words in which to describe the peculiarity of the season, and it is no wonder, for so unusual a thing as frequent and really wet showers in June are not within easy memory. The coldest January and the wettest June in the same year show that the weather machine has slipped a cog in some part of its gearing. At some points an inch of rain has fallen, in others but a fraction. There has been considerable injury to hay and grain, and farmers have caught themselves timidly watching the clouds, as they used to do back East. It is an old theory that rains follow aerial concussion like that produced by the cannonading in a heavy battle. This gives the clue to the course of recent weather. It is the result of the boom. Corroborative testimony is found in the unusually wet seasons in Southern California during the last few years.

In spite of the rain there is now the greatest activity in the hay-field, the grain-field, the orchard and in the packing-houses and canneries. Farmers have little time even for politics, which can generally be crowded into any rush. But politics will keep.

STOCKTON is likely to have a cannery before long, as a party of enterprising men have taken the project in hand and are pushing it energetically.

Architecture and the Age.

Man shares the building instinct with the beaver, ant and bird. It exists in him as the power of language, to be developed according to his needs and circumstances. It found its first expression in erecting a shelter from the elements. The rain and hot sunbeams soon suggested the need of a roof. Hence the Indian has his oval-shaped hut, the Esquimaux his ice-dome. Architecture dates from the day that man began to decorate his shelter in order to gratify some vague craving for beauty and proportion.

The story of a man's social life is written in his buildings: their style, elaboration and use mark his advance in civilization. They are the symbols of his progress in law, politics, learning and religion. The architecture of Egypt consists of temples and tombs. Greece has left us only temples, and Rome, in addition, has left us baths, amphitheatres, aqueducts, triumphal arches and columns. The marriage of the classic and Teutonic races produced the Gothic cathedral, that marvel of reeded piers, skyey arches, buttresses and pinnacles, mullioned window and stained glass. Here the painter emblazoned the legends of saints and angels on the piers. Here the emperors and warriors hung along the vaulted arches the trophies and symbols of war. Here pilgrims from the Holy Land, and poor, pale women, brought their votive offerings. Here the people fled, as to an ark of safety, from the plague and devil. But all over the ages of Egypt, Greece, Rome and Gothic art there is not a free school, a public library, nor an asylum for the insane, the blind, the deaf and dumb, nor an altar to human love and brotherhood. The fraternal sentiment flickered in a few esoteric clubs, like a feeble lamp in a stormy night. It grew as a wayside flower, as a tender plant under the eaves of a glacier.

Ruskin somewhere says: "In main we require from buildings, as from men, two kinds of goodness; first, the doing their duty well; then that they be graceful and pleasing in doing it, which last is itself another form of duty." This is why we are more attached to the cozy and elegant cottage than to the garish, ribboned and embroidered structures of the French Renaissance. Its use is apparent, and it is such a charming use. As we look at it we feel almost sure it shelters love, marriage and children. It has such a sociable look. Every stone and bit of timber, even the gate says, "Come in, you are welcome." Ruskin finds much to stir his wrath in the fact that so much modern architecture does not symbolize use. We have stores with turrets and bannerets, like college buildings; insane asylums, that look like Moorish alcazars or European palaces, and churches that sport the airs of the tivolio or casino. It may have been a joke that a Michigan woman saw an engine-house with a steeple, and innocently asked a gentleman, "What church is that?" and on reading, "Deluge, No. 3," replied, "I guess it must be the Third Baptist." Still it would not be safe to judge our churches, theatres and city halls from appearances.

THE CANNERIES.—The Yuba City and Marysville canneries are reported by the *Appeal* as in full action. The former has 175 hands and the latter 200. The product up to June 15th was 70,000 cans and 150 tons of apricots respectively. The Yuba City cannery is to make a run on cherries shipped by A. B. Woodworth of San Leandro, Alameda county. It speaks well for the concern to draw fruit from such a distance, but Alameda Co. ought to do her own canning.

LABOR AND FRUIT.—At the regular June meeting of the State Horticultural Society, "labor supply and labor-saving appliances in fruit handling" will be under discussion. The meeting will be held at 1 P. M. on Friday, June 29th, at the State Board of Horticulture rooms, 220 Sutter street, S. F. All interested are invited to attend.

THE last spike celebration at Santa Rosa took place on Wednesday.

It Should be Done.

Baltimore has just set a good example. Public opinion culminated at a grand mass meeting, demanding the enforcement of the law against dives and deadfalls, and the worst places have been compelled to close their doors. We hope this example may prove catching. San Francisco badly needs a boom in the direction of decency. We have enough law to make the city clean, and a safe place for our children to go to school in, were it enforced. Stop the music and dancing and vi'e dramatic slush wherever liquor is sold, and the dive would quickly vanish. Such dens live and thrive by beating tom-toms, tooting horns and thumping pianos. This attracts a crowd to loaf and guzzle, for lewd women to entice and toughs to drug and rob. This sort of orgy is steadily going on, and that, too, on our most prominent streets.

But if musicals and theatricals must be tolerated, then close the bar and stop the sale of intoxicants upon the premises. This would make the game hardly worth the candle to the keepers. It is only when the two run together that pimps and panderers thrive. The young, the weak and the unwary are inveigled into these dens to hear a song or witness a dance. Soon the bar attracts them; they become the victims of the vile compounds, and are easily picked and fleeced by the degraded habits of the place. This state of things could be broken up, or greatly modified, if the people demanded it. It is not preaching against scarlet sins we want; it is the authorities, armed with mop and scrub-brush and vigorous muscle.

The Australian Scale Destroyers.

Prof. C. V. Riley has written a letter to D. W. Coquillett of Los Angeles, concerning the search in Australia for the parasites which are thought to be instrumental in holding in check the cottony cushion scale. The following is an extract from Prof. Riley's letter:

It strikes me that there is not the slightest occasion for hurry in this matter, as the proper time to start will not be before the 1st of September at the earliest. I think that there is no doubt but that the commissioner will be in such position as to authorize the sending of a Government agent, whose expenses will be paid either by the Department of State or by this department. Moreover, there is still some chance for a special clause authorizing this department to send an agent on this special trip. At all events, as our Appropriation bill has passed the House, I feel that I have power, and probably means, to do something and shall decide early in July. The probabilities are that I shall send either yourself or Koesele, and perhaps follow myself a little later.

We are glad that there is a chance of Prof. Riley's taking a personal share in this investigation, and it seems to us that it would be a fitting thing if our Government entomologist could have opportunity to observe the Australian fauna in its habitat. He has accomplished very much by his visits to Europe, and should have the fullest opportunities for observation elsewhere.

Concerning the proper time for the work of the Australian mission, Prof. Riley writes:

The Australian spring corresponds with our fall, and the proper time to study the parasites in their active life will be our late fall or winter months. I do not mean by this that it will be the best time to ship them to California, because the probabilities are that the best time for that will be the season corresponding to our spring, in which event I should be in favor of arranging with some local agent there, or, perhaps, leaving one of the party there until spring.

Prof. Riley naturally takes a deep interest in this matter, as it was at his request that the parasites were sent to Mr. Klee and Mr. Coquillett. He welcomes, however, the fullest co-operation of California fruit-growers, and would be glad to have Mr. Crow participate in the enterprise, as has been suggested. The whole enterprise has a promising look, and we trust nothing may occur to prevent its advancement.

COMMENCEMENT EXERCISES of the University of California, and the transfer of the Lick Observatory to the Board of Regents, will take place at Berkeley on Wednesday, June 27th, beginning at 11 o'clock A. M.

Sugar or Wheat.

Wheat-growers who are nearly always cogitating as to what they can do with their lands to secure larger returns per acre will be interested in an article which we print upon another page in which sugar is brought forward as a substitute for the great cereal. This home-grown sugar is an old subject, and it does not make progress at all commensurate with the amount of talk there is given to it, and yet if we are to judge by reports there is continually being some progress made toward a satisfactory demonstration. We refer to sorghum as a sugar source. This plant seems to have demonstrated its value clearly enough to secure the investment of money by Boston capitalists to carry on sugar-making at two points in Kansas. They have joined interests with Prof. Swenson, who recently was arraigned before Congress for securing a patent upon a process which he devised while in the Government employ in the Department of Agriculture. This process, they claim, enables the company to extract "three times the amount of sugar that has heretofore been possible, and the sugar of improved quality." Instead of crushing the cane between the rollers, the juice is taken out by the method known as diffusion, warm water being used. In the work of crystallization the losses arising from inversion are avoided by the Swenson process. The company has two factories in Kansas and they have a capacity for 500 tons of sorghum canes per day. The cane is grown by farmers and sold to the company.

The State of Kansas allows a premium of two cents per pound on sugar from sorghum, the bounty remaining in force for four years. This bounty is the Government favor which the writer, on another page, believes should be extended by the general Government to all sugar-producers. Other claims by the Boston Company are as follows:

Growers can raise from 10 to 20 tons of sorghum cane to the acre, and their crop can be perfected in 90 or 100 days.

The average outcome of a ton is 102 pounds of first sugar, testing 94 to 98, and in addition 15 gallons of molasses. The by-products form an important addition to the main profits. In fact, these were sufficient to meet all the operating cost last year.

The by-products are the seed which is used as grain and for glucose leaves and cane chips for cattle food.

The sorghum crop has special advantage over the sugarcane as produced in Louisiana in that it is three months earlier, thus gaining much in the time of reaching the market.

We give these statements as we read them without vouching for their accuracy. Our wheat lands are being reduced by the advance of fruit growing, and the many irrigation enterprises now being developed will turn much more into alfalfa farms with their complement of live-stock, etc. But still we have a great deal of land in this State, which we can grow as good sugar plants on as the world can show whenever the capitalist is ready to come in and offer a fair price for the crops.

Beware of Sparks!

Warnings against the small beginnings of field fires multiply. On Tuesday of last week sparks from a locomotive set the grass ablaze in three places at Sargents, Santa Clara county. A stiff breeze was blowing and the flames quickly devoured 17 acres of dry grass; but a band of resolute fighters put out the fire before it could reach the 250 tons of hay stacked in the field adjoining.

On Friday some boys were shooting on John Boggs' ranch near Princeton, Colusa county, and the discharge of their gun started a fire which destroyed 150 acres of wheat averaging, it was estimated, 25 bushels to the acre.

And on Tuesday of this week some small boys at play in the Presidio of San Francisco set some grass burning "just for fun," and thus started a conflagration which overran 900 acres and required the calling out of all the troops and some hours of battling with wet sacks to save the trees and buildings adjacent. The dense smoke from the burning brush filled the western part of the city and harbor and aroused for a while a deal of apprehension.

Such monitions at the opening of the dry season should be heeded and taken to heart. Look out for the small beginnings. "Beware of sparks!"

MINNESOTA is threatened with a grasshopper scourge.

A Packing and Drying Establishment in Vaca Valley.

As the fruit-packing and drying season is now opening, it is timely to give a sketch of one of the best outfits for drying and packing in Vaca valley, which is owned by L. W. Buck & Son. In our account of a visit to the valley we alluded to the establishment. There are two buildings separated by a narrow passage-way. The two-story structure is 36x44 feet. The lower story is used for packing, paring and cutting fruit for drying, etc., and the upper for box nailing, storage of dried fruit, etc.

The one-story building with the veranda is the drier, 16x36 feet with a brick furnace bisecting it. The drier is Blowers' patent. Of the cost and manner of construction Mr. Frank H. Buck gave the following account, in answer to questions, at the Sacramento fruit-growers' convention.

The building cost me, as I have it now, with the capacity of four tons of green fruit, \$850, with the brickwork, furnaces and the building,

found of great value in hastening the drying and thus increasing the capacity of the machine. The fan is run by a portable engine outside the building. Mr. Buck found out last year, however, that he must utilize the sun as well as the drier to use up the vast amount of fruit which he had ripening. He handled an average of 20 tons a day of green fruit during July and August last year and employed 80 to 85 hands, and his busy season with different fruits extended from June 15th to October 1st. The orchard area under ownership of L. W. Buck & Son comprises 250 acres. It reaches across the floor of the valley from side to side and up and down the valley rather more than a mile.

This year preparations are all ready for re-enactment of the busy scenes of the summer of 1887. Much more extended facilities for sun-drying have been secured.

Our picture gives a hint of several matters pertaining to the fruit interest in Vaca Valley. In the background is a large group of the "hands" employed in cutting fruit. Men

The Dairy in Oregon.

Dairying in our sister State seems to be scoring some progressive points. At the meeting of the State Dairymen's Association an address was delivered by President Paulsen, in which he says that during the last three months several new creameries have been started, but there is room for more. Mr. Paulsen advocates the increase of the cheese product for he says: "In my opinion cheese factories would in all localities not very close to the city market, return a far better profit than butter factories; the price of cheese being relatively far higher in this State than butter, especially in the summer months. Cheese also has the further advantage that it can be marketed in bulk, whereas butter has to be sold fresh to realize best prices. There is no reason why we should not produce all cheese needed in our home market, but so far only a very small portion of the cheese used here is manufactured by our own people."

The Oregon dairymen evidently do not be-

The Way it Works.

A few years ago there were representative Australians inspecting this country to discover what our local facilities were for the production of fine wools. They liked to sell wool in the United States, but they found it a hardship to grow it in Australia, and pay the tariff on it before reaching American markets. They naturally thought they could do better by moving here and growing wool in a country which afforded such good markets. We have not heard whether they acted on this natural conclusion or not, but the idea was a good one. People who like American markets should bring their capital here and build up our local producing industries. Removing the tariff would allow them to have their capital and labor in Australia, and we should have the privilege of shipping our gold there to build up that country instead of advancing our own.

This fact is recalled by a note in the *Evening Post* the other day to the effect that several Australians who have visited the State Board

HON. L. W. BUCK & SON'S PACKING HOUSE—THE LARGEST IN VACA VALLEY.

without the trays. I use a tray made of half-inch slats, nailed together and spaced about one-eighth of an inch apart. The trunk of the drier in one end is the brick furnace, or the hot-air chamber, which contains the sheet-iron drums, or fire-box, and from this, then, is a system of drums running back and forth through the hot-air chamber, which thoroughly heats the air, and the cold air current comes in at one side of the furnace; it is deflected by the heat drums to the top of this air chamber; from there it comes back nearly to the ground, and passes out into the drying-rooms. There are five rooms running parallel and alongside of each other; each one is separate from the other, and each of these rooms holds about 120 trays. The current comes in at the bottom, and right there where the hot air comes out we have a row of solid trays, which carry the heat from the back right through to the front. Then each layer above that is the slotted trays, with occasionally two or three more rows of solid trays toward the top, that carry the current back and forth; then the first row of trays above the solid row in the bottom goes clear back against the wall, and leaves a space of about six or eight inches next the doors, which allows the current to go up one row of trays; it strikes over the next row of trays, coming clear out to the door, which carries it back, which gives it motion like that back and forth, clear across the room, and about one-third of the way up from the bottom we let in a smaller current of air up from the furnace.

Last year Mr. Buck improved his drier by placing an exhaust fan on the top. It was

women, and children were all kept busy at profitable prices.

In the foreground are two of the orchard trucks, which are largely used in hauling fruit from the orchard to the packing and cutting houses. They are light, turn easily, and have broad tires, so as to run well on the loose soil of the orchard. Beyond is a four-horse fruit wagon, used in conveying the fruit from the packing house to the railway station. The picture generally suggests the activity which pertains to the fruit harvest.

THE SAN DIEGO FLUME.—A party of Eastern capitalists and citizens of San Diego—among whom were Col. W. G. Dickinson, Benj. Kimball of Boston, James D. Phelan of S. F., O. S. Hubbell and J. H. Braly, San Diego bankers, Geo. D. Copeland, vice-president of the flume company, and T. S. Van Dyke—lately made a trip of inspection along the great flume. The *Union* says that they went out to the diverting dam and viewed the line of the flume and the country through which it passes 25 miles down to the Cajon valley, coming about nine miles in a boat on the water in the flume, and got back convinced of the immense value of the project and the wonderful results which must immediately follow its completion, now near at hand.

lieve in relaxing their local efforts against bogus butter, even though the United States has legislated concerning it. Mr. Paulsen said on this point:

A most determined effort was made in our last Legislature to repeal our Oregon Dairy law, under the plea that the national dairy law rendered a special State law unnecessary. While the national dairy law is of some benefit to regulate the manufacture of "bogus" butter, it is of but little value to protect us against the sale of the "stuff" in our markets, and no greater injury could be done to the dairy interest of the North Pacific Coast than the repeal of the Oregon Dairy law; and whosoever advocates such repeal, under any plea whatsoever, is and should be treated as the enemy of the dairymen of this coast; and the consumer as well should earnestly protest against the repeal of this law. It would be well for the dairymen and farmers of Oregon to call meetings, pass resolutions and otherwise inform the members of our next Legislature that any legislation repealing or altering our Dairy law does not meet the approbation of our farmers.

This is good doctrine. It has been shown that the States have rights in this matter, even to absolutely prohibiting the manufacture of the bogus material, even if it is licensed by the United States Government. Our State laws are valuable and should be maintained upon the statute books.

of Trade rooms in this city have been surprised at the fineness of the wool and wool products there on exhibition. One of them is credited with saying that he had always heard that Australian wool was the finest in the world, yet he had no idea that such splendid blankets could be made in this country, and that the blankets we made here were far superior to those made in Australia. The Australian sheepmen are wonderfully pleased with the wool they saw from Tehama county, and declare that nothing like it was ever seen in Australia.

They say that there are 80,000,000 sheep in Australia, and that they are ardently praying for free trade to have sway in this country, and that this is the daily and nightly burden of their prayers.

This is the idea exactly, and the question is shall we continue the production of this fine wool and increase it, as we easily can if the proper protection is given to our producers, or shall we kill our sheep and enrich Australia? That is one of the questions which has been forced upon this country as a political issue. How shall it be answered? It is not surprising that Oregon has declared that American markets are, and shall be, for American producers.

PUBLIC AFFAIRS.

Our Local Interests in Tariff Reform.

[Being intended as a prize essay, in answer to an offer by the Reform Club of New York City, of \$250 for the best essay, and \$100 for the publisher, open for all parts of the United States.]

CHAPTER I.

Lay the foundation first on patent fact
And then your theory, solid and compact.

The tariff is and will be a vexed question in the United States for many years to come. It affects different parts of our country, and different persons so unlike, that no argument could possibly be acceptable by all concerned. It is not hoped to suit everybody. It is not expected to reach all the judges in this case with a solemn conviction that we are correct. We shall be content if the determination be that we have deserved public attention and done something to bring about a better understanding of this vexed question.

The invitation is to the Union at large. We shall therefore understand that "Our Local Interests" means those of all our Union, as distinguished from the rest of the world. We may glance at tariff effects in different parts of our great country, and incidentally of New York and New York State; but the general argument will affect our people and territory as a whole, and regard their general interests as one, which indeed they are, when truly considered.

The first element in this discussion is the facts of the case, and they may be stated as follows:

We have three millions of square miles of territory, removed 3000 miles by water, and some of it as much by land, from the great world of civilized commerce.

It is in the temperate zone, with a fair share of rich soil, mines, fisheries, forests, pasturage and raw material of all kinds. We have 60,000,000 of people, about 20 to the square mile. It follows that we select for our own use the best of all these good things. We cultivate only the best soil, work the best mines, fisheries, forests, etc.

In this work we are aided by the natural product of all the rest around us. The farmer who cultivates 100 acres has often 1000 in wild grass, etc. His stock picks up all this, in addition to what he raises by the plow. A day's labor, well bestowed, under these conditions will produce five times as much as that of a Chinaman whose tenth-rate land is cultivated and only the most sterile remains out of doors to be cropped by stock.

Among the American people thus employed on these rich natural resources, at least one half of the laborers have some education, ambition and skill, and work brain nerve and muscle to better their condition. They are well-fed, alert and eager to earn all they can, better wages and more profits. It is a notorious fact that in any process where dexterity is an object even the English workmen falls at least one-fifth behind the American, and the slaves of China, India and Egypt are mere drones in comparison.

Take all these facts into consideration, and you will find the product of a day's labor in the United States to be all the way from one to five times what it is in England, France, Italy, Egypt, and other nations on a par with them.

Let us take wheat for a familiar illustration. The American farmer has A. 1 soil, and takes 30 bushels to the acre. He has fine horses, well fed on the common, all around him. He has gang-plows and the best of other machinery. When his grain is housed he has spent six days in labor, and has 30 bushels, 5 for each day. Rent is small, because the farmer will rather take up second-rate land, of which there is plenty, than pay more than the difference in rent. Labor, seed, and machinery divide the product. And either labor must be well paid, or rent and profits get the lion's share.

Then this holds, to keep down rent and keep up labor, and moderate the price of the product, that there are but 20 persons on the square mile to eat the crop and only the workers of that 20 can be hired to labor. In such a state of things the wages of the laborer must buy at least two bushels of wheat.

In England many of these facts are reversed. In a small island there are 35,000,000 of people, 300 to the square mile. All the land is inclosed, save the mere desert. Tenth-rate land is cultivated, fertilized, thoroughly manipulated. The horses are fed in the barn. The whole process is slow, methodical, nerveless drudgery. The result, twice the number of days' labor, and only 20 bushels to the acre. To the day's work two bushels and a fraction.

Of this, rent takes the lion's share, because labor is abundant, and the price of the product is enhanced in the market, because there are 300 people to buy. The laborer cannot buy one bushel for his days wages. Whenever the land is richer and approaches the American soil, the landlord gets all the difference. The poorest land in cultivation settles the wages of labor and what it will buy in the market. The wages never can buy much more than half its product in the poorest land in use in any country.

In Egypt, India and China, labor is at its lowest terms. The population is thick, tenth-rate land is cultivated by the poorest implements and by spiritless slaves. The satrap or mandarin takes every grain in rent, that the rich land is worth over the poorest. Wages are just what this nerveless unskilled labor can

make, less the other expenses and profits. And it occurs that when all is done, 20 cents a day is large pay, and will only buy a quarter of a bushel of wheat, or its equivalent in rice, etc.

When we come to fisheries, mines, timber, etc., we have an abundance of all, and only the best are operated. The farmer will not leave his rich soil and two bushels of wheat a day for any other business that will not pay as much. Gold mines in California are worth nothing that will not pay \$2 per diem for working. In England such a mine would be a fortune. In India or China it would be worth millions.

So with our timber. We have the growth of ages. We select the best, hew it down, take the finest parts and leave the rest to rot. So our workman gets out 200 feet of timber a day with ease. In England the culling has all been done. Good trees are valuable. Second, third and fourth-rate are taken. The whole must be worked up, the knots, all. The result is, 50 feet of lumber is the day's product. Wages cannot buy more than 40 feet, while in America they will buy 160 up to 200.

This is the primary reason why wages are and must be in the United States higher and able to buy more than in any other country in the world. Here are the elements that go to make it so:

Rich natural resources.

The best only worked.

With energy and skill.

Labor in demand.

Home market small.

Wages high from few people.

Prices low from few consumers.

Exporters of raw material.

Importers of finished manufactures.

These wages, these products, are independent of any tariff. They are in the very nature of things. Where a laborer can produce five bushels of wheat a day, his wages must be able to buy three of them or he is most grievously robbed by somebody, and this is the case in the United States.

In England, where good land is limited, where tenth-rate is cultivated, and the dull laborer can only produce two bushels of wheat an acre on such land, his wages cannot buy more than one bushel.

In India, with the same tenth-rate land, and much inferior, sluggish, slave labor, from one to two bushels will be the utmost product, and the slave is denied all but a mere subsistence.

This is the rule: Given a land replete with people, uneducated slaves and their masters, and the masters take all except what is necessary to subsist the slave and his family. The slave race must not die out for want, but it must not advance to wealth and independence. To work, eat, drink, rest, breed and die is their fate.

Given a free and intelligent people, not too many to the square mile, amid rich natural resources, and they will take a fair share of those resources.

If all our fields produced a hundred bushels of wheat to the acre, and 20 to the day's labor, and all our mines, forests, fisheries, etc., paid in proportion, our wages would go up, or the prices of produce come down, till the expert laborer could buy his 20 bushels of wheat with his day's work. It must be, or somebody get it from him by indirection. Labor's wages must represent the product of that kind of labor, on that kind of soil, mine, etc., less the rent, expenses, profits and taxes.

Were we 300 to the square mile, and as we reach that condition, labor will earn less, and food will cost more, till we achieve the condition of England. The prime factors that enter into this account are resources, population, skill and energy in production. These determine wages and prices.

It is true that other influences may produce slight waves of advance or depression, but these prime factors forever fix the water mark of high or low wages.

The finding of gold in the gravel surface of a large portion of our country, that would yield \$5 a day to the hand, would take wages to that figure. We should cease to export anything but gold, and the price of all our commodities would come up.

So the sudden influx of cheap labor, beyond what our natural resources demand, would take wages down, till it abated. We shall perhaps some day have 300 people to the square mile. We shall move on a gradual incline to that condition, with undulations, as population overflows the resources, or war or pestilence may reduce the people.

A tariff is comparatively a small factor. It can do a little, to smooth and modulate, but it is an exceedingly small fraction, even at its utmost, compared to the great causes here enumerated.

(To be Continued)

C. E. GRUNSKY, who has been connected with the State Engineering Department for ten years, has resigned his position as Chief Assistant to the State Engineer, to accept the position of Chief Engineer of the Central Irrigation District, the Colusa county and the Modesto Irrigation District, Stanislaus county. He will retain his residence in Sacramento.

PROPOSING to tap Goose lake and thence draw water to irrigate 100,000 or 200,000 acres of desert land in Modoc county has roused a deal of opposition among the lake-dwellers in both California and Oregon.

UNIAH is to have a colt-show at the race track July 4th.

THE IRRIGATOR.

What the Wright Law Provides.

EDITORS PRESS:—I have received the "marked copy" of your paper containing an editorial entitled "The Wright Irrigation Law." In it occurs this statement: "The riparianist will not forget that the water cannot be taken from him under this law."

In this you are in error. The law makes full provision for subjecting the rights of riparian owners to the wants of an irrigation district upon making the compensation provided for by the Act. That is to say, the interest of the riparian owner in the water may be acquired by an irrigation district by condemnation. No decision of the Supreme Court has ever, in this State, been in conflict with this principle. If you will interpret the decisions of our Supreme Court, and the irrigation law together, you will find that they together amply protect the waters of the streams from monopoly, and, at the same time, provide for their complete distribution for irrigation purposes. — C. C. WRIGHT, Modesto, Cal.

[Thanks for the statement. We intended to convey the idea that riparian rights are recognized so far as to require an equivalent to be tendered therefor when the needs of the greatest number require condemnation of the water. Of course, to divert the water for irrigation, and at the same time not take it away from the riparian owner would be in most cases a physical impossibility. We are glad Mr. Wright has called attention to the statement which we unintentionally made in the matter.—EDS. PRESS.]

Stanislaus County Enterprises.

EDITORS PRESS:—Since the decision of the Supreme Court sustaining the validity of the Wright Irrigation law, the people of Stanislaus county have aroused to a pitch manifesting considerable enthusiasm on the question of irrigation.

The Turlock and Modesto districts were formed last year under the "Wright Act," with boundaries permanently defined, with water rights located and canals surveyed, ready for immediate action as soon as the constitutionality of the law should be declared valid.

The Modesto district made a location comprising or covering about 108,000 acres, lying between the Stanislaus and Tuolumne rivers, and extending west to the San Joaquin. To obtain water and raise to an elevation to cover said territory, they located a dam site about two miles above Knight's Ferry, on the Stanislaus river, requiring a dam high enough to elevate water into a ditch 90 feet above the surface of the stream at low water and 10 feet higher additional in order that no water be allowed to pass over said dam into the main channel, but to be carried over an artificial embankment and thus establishing a new channel for the surplus to pass off, at an estimated cost for the whole works of about \$600,000.

Oakdale and vicinity, comprising a territory of some 5000 acres of the finest land in the county, nestled down in a beautiful nook on the south bank of the Stanislaus river between the north line of Modesto district and said river, was for some reason not apparent on its face, entirely ignored by said Modesto district, and left out wholly unprovided for. The people of Oakdale not desiring to be starved out or die of thirst, sought means of averting their impending calamity by the discovery of other resources not yet appropriated. An Irrigation Company was duly formed with a capital of \$100,000, and the services of a competent engineer employed who, in a preliminary survey discovered that at a point on the Stanislaus river—11 miles above Oakdale and two miles below Knight's Ferry—a dam could be built for \$10,000 which would secure the full use of the water from the oldest water right on said stream, after passing the Knight's Ferry flouring mill, from which point with an outlay of less than \$100,000 water can be conveyed over the Oakdale district, and also over 80,000 acres or about four fifths of the entire Modesto district, including the town of Modesto.

Under the present law there is no provision allowing the Modesto district to annex Oakdale to its territory. The only way, if there is any way open, would be for Oakdale to form a district under the Wright law, then by a majority vote of both districts a portion of the Modesto district could be annexed to Oakdale district. But we propose to wait till the Legislature shall so amend the Wright law that a portion of a district, by a vote of a majority of its citizens, can be set to whichever district they may choose.

In the meantime the people of Oakdale, believing they have one of the most valuable water rights in the State, with unsurpassed facilities in proportion to the expense required, propose to hold on to their rights and commence immediately to construct a ditch of sufficient capacity to irrigate the Oakdale district, which our engineer says can be done, including dam, for \$30,000, and thus obtain water one year in advance of any other district in the county.

C. S. S. HILL.

Oakdale, June 18, 1888.

The Arizona Climate and Tree Pests.

EDITORS PRESS:—Will you permit the columns of your paper to bring together or disperse those parties pro and con who offer to "I'll bet you."

Here is the wager I have to offer: That some one in California (or elsewhere) furnish a given number of trees of any and all kinds of fruit-trees—shade and ornamental, anything that carries any or all classes of scale bugs. Ship them to Phoenix, Arizona, there to be received by a commission of one or more persons mutually agreed on, planted out and well cared for. Said trees are not to be sprayed, fumigated nor in any way molested, so as to militate against the well-being of the life and health of the scale bugs, parasites, fungus, blue mould or rust.

Now it is agreed that if these trees of their own strength in growing cast off all parasites, scale bugs, moulds or rusts, then shall the party of the first part be without any remuneration for the prime value of said trees, together with costs of transport, and shall pay also the gardener's (reasonable) bill, for caring of said trees in said test. But if any of the parasites, scale bugs, fungus, rust or mould be and remain on any of the said trees in said test, then shall the said party of the second part pay to the party of the first part the prime value of said trees, together with the cost of transport and the gardener's (reasonable) bill of care and culture. The growth of one year shall decide the case.

Tempe, Arizona.

GEO. K. MILLER.

From Southern Oregon.

DEAR OLD RURAL PRESS:—Thinking a few lines from Southern Oregon might be of interest to some of your readers, I write you.

We had a very dry spring until about the 25th of May, which shortened up grain crops somewhat, but since that time at least four inches of rain has fallen and vegetation is just hopping. Alfalfa is badly down; would like to have a few weeks of California sunshine to do our haying. It looks like clearing off now.

The fruit crops will be good. A great many new orchards have been set out the last winter, and old ones are receiving better attention than formerly. Winter apples, pears, plums, prunes, peaches, almonds and the Mission grape do well in this country, and farmers are turning a great deal of attention to fruit.

Diversified farming is carried on much more than in the Sacramento valley. Farms are generally small. The country is just awakening to its resources. A great many new-comers are buying and settling in Jackson county. We have a great deal of very fine productive soil, and as good a climate as any country 1400 to 2000 feet high, surrounded by timber-covered mountains, could expect. We have but little heavy winds, last winter being an unusually cold one; the mercury for three or four mornings hovered close around zero, 3°, 4°, 6°, 7° being the coldest. It was a little tough on us old Californians after living in the Sacramento valley for 23 years raising wheat.

I have as good a grass ranch, for its size, as there is in Southern Oregon. All kinds of vegetables do well on our best land without irrigation. A great deal of foothill land is vacant, and railroad land could be utilized by irrigating with the waters of Rogue river, a clear, rapid stream abounding in trout and salmon. Such a stream in the dry interior valleys of California would be worth millions.

I must close, wishing success to the RURAL and its many readers. Inclosed find one year's subscription. I think I have taken it 14 years; hope to be able to take it 14 more.

J. B. DUNGAN.

Gold Hill, Or., June 10, 1888.

An Erroneous Statement.

The following paragraph appeared in the Lakeport Democrat of June 15th:

The County Pamphlet.

The Lake county pamphlet has been received and every one is disappointed in the appearance of it. The work bears the imprint of the *Clear Lake Press*, but we feel satisfied that Brother Haeussler never printed it, for he is too good a printer to allow such a blotch to leave his office. The *Rural Press* office of Oakland, however, did print it, and they should never receive a cent for the work, as the contract provided for a far better job in every way. The money donated by the county, together with what advertisers contributed, was sufficient to have paid for a first-class job, and the county and business men should not pay a cent until the contract is fulfilled. The pictures in the book are simply outrageous. Two in particular—a view of Lakeport and one of Clear Lake—are disgraces to the subjects they are supposed to represent or to any subject for that matter, and it is necessary to label them in order that the oldest inhabitant may recognize them. These pamphlets will go begging for circulation, and the money spent on them thus far is just that amount wasted.

[The PACIFIC RURAL PRESS office is not in Oakland, neither has the PACIFIC RURAL PRESS done any such printing as is described above.]

TO PRESERVE BUTTER WITHOUT ICE.—Put your butter in a small bowl, set this in the deep saucer of a flower-pot, turn the flower-pot upside down over the bowl of butter; plug the hole in the pot with a cork; keep the saucer filled with fresh water, and the evaporation will preserve your butter without ice.

The Mesquit Bean Tree.

In Arizona and portions of Southeastern California, there grows a tree called the Mesquit bean tree, the timber of which is especially suited for that exceptionally dry, hot climate. When made into felloes for wheels it will not shrink, even if newly cut, as its sap is of an oily nature like lignum vitae. This wood is dark in color, hard and knotty, and rather rough to work. It is valuable, not only as wagon timber, but because it produces a large crop of beans which when ripe drop off and are harvested with a rake. The beans are about ten inches long and quite thin, and about half an inch wide. The seed or bean proper is very small, but the pod and pulp is very sweet and the Indians use them for food, grinding the pods up into flour. The Moqui Indians make this flour into tortillas and bake them on a flat stone from which their fire had been swept. The tree grows in the sandy deserts, but thrives best in the sinks of streams, or ancient riverbeds where, as it forms an obstacle to the drifting sands, great sand hills accumulate around the trunk, from the top of which the branches spread out luxuriantly. When wood is wanted by the teamster to rim his wheels, or by the settler for fuel, the trunk or larger branches have to be dug out, recalling the complaint of an Irishman in Arizona: "Begad its a quare country where a man has to take a shovel wid him to git firewood and a hoe wid him to cut hay" (the gietta grass).

It is surprising that this wonder of the vegetable kingdom has not been systematically cultivated in Southern California. It will grow anywhere there with small care, and in addition to its value as a wagon hardwood, furnishes shade, fence, fuel and forage, for the beans are excellent food for sheep or hogs. What the Caraba tree is to Cyprus and the shores of the Eastern Mediterranean the now neglected mesquit my yet become to Arizona and semi-tropical California.

Artesian Belt Land
AT LOW FIGURES.

The southwest quarter of Section fifteen, Township twenty-three, Range twenty-four west, one-hundred and sixty acres of rich level land, near the center line of the Artesian Belt in Tulare County, five miles northwest of Alila, on the S. P. R. R., is offered for sale at the exceedingly low price of fifteen dollars per acre. Address, "Landowner," Box 2361, San Francisco P. O., or to the care of this paper.

LAND & WATER FREE!
800 Acres Rich, Level Land.

To some one who will summer fallow and cultivate well, will be furnished free water and use of 160 acres of good land (S. E. Sec 13, T. 21, R. 23) within 9 miles of Tulare, S. W. Forty acres formerly plowed. Land on all sides cultivated and pastured. Water for irrigation (if needed) free. Also (without water) 640 acres (Section 13, T. 23, R. 24), four miles westerly of Tipton and S. P. R. R., all in Tulare County and the Artesian belt. For particulars call on E. M. DEWEY, 7 miles S. W. of Tulare, or A. T. DEWEY, 220 Market St., San Francisco.

FOR SALE OR EXCHANGE.

Ranch of 200 acres on Coquille River, Coos County, Oregon; 40 acres bench land 160 acres bottom, 80 acres under cultivation; 1 1/2 miles from Coquille City, one-half mile from river landing. An abundance of fine spring water on place. Price, \$1500 cash, or will exchange for California property in vicinity of San Francisco Bay. For further particulars apply to
 H. GOETZ,
 659 Clay St., San Francisco, Cal.

PALM VALLEY!

TROPICAL WONDERLAND!

EARLIEST FRUIT LAND IN THE WORLD.

EARLIEST VEGETABLE LAND IN THE WORLD.

FINEST WINTER CLIMATE IN THE WORLD.

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?
 DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?
 DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?
 DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND COMPANY

Has secured 2000 acres of this choice land; has subdivided it into 5 and 10 acre lots, which they are now selling at \$200 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. Two hundred acres have now been sold on this basis, starting at \$150 per acre. The price is now \$200 per acre.

The Company has a Stone-walled Irrigating Canal, over ten miles in length, completed.

They have completed a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the town site owned by the Company.

They are planting 160 acres to an orange grove, of Navel oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State. No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

THERE IS NO FROST, NO FOG, NO HARD WINDS.

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

BRIGGS, FERGUSON & CO., General Agents,

314 California Street, - - - - - San Francisco, Cal.

SANTA YNEZ,

Santa Barbara County, California.

THE SANTA YNEZ LAND AND IMPROVEMENT COMPANY

Is now offering for sale at low prices and upon very moderate terms the choicest of

Agricultural and Horticultural Lands

Of the famous College Grant, in the aforementioned beautiful valley. The CLIMATE is perfect, SOIL rich and diversified, TOPOGRAPHY unusually varied and beautiful, a park-like growth of Oaks covering the entire valley. WATER SUPPLY more than sufficient for irrigation of all irrigable lands, and no alkali either in water or soil.

TRANSPORTATION FACILITIES superior now, and two trunk lines certain to pass through the valley within a year.

43,000 ACRES OF THESE CHOICE LANDS

Are for sale at from \$25 to \$150 per acre; terms of payment being one-third cash, one-third in two, balance in three years; six per cent interest on deferred payments.

To reach the Santa Ynez valley take any transportation line to San Luis Obispo, thence by Pacific Coast Railway to Santa Ynez or to Santa Barbara, thence by stage to Santa Ynez. Persons seeking lovely homes or lands for home or quickly paying investments, cannot do better than purchase here. For further information refer to

MERY'S IMPROVED PIONEER BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

This Mill has been in use on this Coast for 7 years,
TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor,
there now being

Over 225 of them in use in California, Nevada & Oregon.

It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

GRAINLAND, BUTTE CO., CAL., June 9, 1887.
Mr. M. L. Mery—DEAR SIR: We have used one No. 2
Ritter Barley Crusher now for eight years and have used
it steady during that time; have crushed 45 tons a day,
and the crusher is as good to day as when it came out of
your shop. I am satisfied that it is the best mill made.
You may reconstruct this testimonial to the best advantage
for you and sign our names, for you cannot overrate
the merits of your mill.
F. E. REAM,
JOHN P. SUTTON.

DURHAM, May 21, 1887.
Mr. M. L. Mery—DEAR SIR: I write to you of the
19th, would say that I crushed from two to two and a
half tons per hour, but could crush three and a half tons
per hour if my elevators were large enough to carry the
barley from the machine. The No. 1 machine I used at
Gridley was run on a sack a minute, but if we got behind
we could run through five tons an hour, and do
good work. The machine I use here is a No. 2.
Yours, WM. M. TAYLOR.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY, Chico Iron Works, Chico, Cal.

The Oregon Fruit-Drier.

We give herewith engravings showing the exterior appearance and interior arrangement and mechanism of the Oregon fruit-drier, which is being sold in this State by Charles Jory of 459 Union St., Stockton. This drier was awarded first prizes at the State Fairs of California and Oregon in 1887, and is highly commended by a number of those who have used it. The Oregon drier consists of a hollow cylindrical tray-supporting-rack frame, situated

Oregon Fruit Drier—Exterior View.

above a furnace and revolving around a central drum and smoke-pipe, the whole being inclosed within a circular shell of brick or wood lined with sheet iron and provided with doors, ventilators, etc., for the purpose of confining the heated air used in drying fruits and vegetables. The principle of operation of the Oregon drier is essentially different from all others, as will be readily seen from examination, having a central heating drum from which the heat is radiated out through the entire drier evenly and thoroughly, thus enabling the operator to dry the entire charge of fruit without changing of trays, as the heated air from the under trays rises obliquely through the inner edge of the

Inside Revolving Rack, Frame and Furnace.

trays above and is discharged through the ventilator near the center of the cone. Provision is also made for placing drip pans under each section of trays to catch the drippings which will fall in drying any kind of juicy fruit, a feature those who have plums, prunes, or any kind of juicy fruit to dry, will appreciate.

The manufacturers of this drier publish a circular of information concerning the operation of the machine and the testimonials of those who have used it, which will be read with interest by those who are investigating driers.

Freights on Canned Goods.

There is still need of concession by the transportation companies. The present schedule bears heavily upon the canned fruit interest and those engaged therein are endeavoring to secure a better tariff. They should succeed. We wish the fruit to get out readily and cheaply in every form, and hope the claims of the canners will be recognized. At a meeting of those in the canning interest, on June 14th, the following resolutions were adopted:

WHEREAS, Present freight rates on canned fruit is working serious injury to the fruit interest of this coast, being almost prohibitory on some descriptions of fruit; and, whereas, the present rates are much higher than last year, notwithstanding the fruit crop of the East this year will be much larger than last season; and whereas, Eastern canned fruits will be sold at lower prices than last year, and unless freight rates are materially reduced, the result will positively be a curtailed pack and decided decrease in Eastern consumption of California canned fruits; therefore, be it

Resolved, That we most respectfully petition and earnestly urge the Transcontinental Association to make the necessary reduction in freight rates. It is further resolved that unless a material reduction from present rates is made, a full pack will not be made, as sales cannot profitably be effected, for the reason that Eastern goods will go largely into consumption throughout the Eastern and Western States, and a decrease in pack and shipment eastward of California fruits must necessarily result.

Resolved, That lower rates this year are an absolute necessity to the fruit interests of this State.

It is believed that the concession asked by the canners will be allowed.

A NEW CANNERY.—The Glendale Canning Company has incorporated to do a general canning business, with \$100,000 capital in 1000 shares. Directors—F. C. Delong, G. E. Chittenden, S. B. McKee, E. Ransom and A. J. Gove.

EXPLANATION.—C. for clear; Cy. cloudy; Fr. fair; Fy. foggy; — indicates too small to measure. Temperature, wind and weather at 12:30 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

Seasonable Millinery.

While green, blue, pink and brown are still the fashionable colors, it must be borne in mind that the green is the veritable apple shade, the blue that peculiar tone found only in a cashmere shawl, the pink that most delicate of tints, vieux rose, while the brown is almost golden.

charming ornaments for the *chapeaux* of woman-kind.

The bonnet shapes differ mainly from those of last season in the greater width of their brims. Their crowns are of the regulation horse-shoe shape, with the outline at the back over the hair made a little deeper and more decided. The brim is sometimes a pointed poke, and again it will be round, with a slight

SOME LATE FASHIONS IN MILLINERY.

The liking for pink has made apple blossoms, and the dainty pink field flowers more popular, while the demand for roses and carnations amounts to a *furor*. Corn flowers, "Quaker ladies," and "ragged robins" are candidates for favor with the admirers of blue, while the list of fashionable greens begins with fine ferns and smilax and does not stop with the ivy and the oak leaf, but embraces also the thistle with its mingling of blue and green. Brown is represented by velvet wallflowers, scarlet by poppies, and crimson by orchids of that shade, while in white there are blossoms galore, roses small and large, and orchids so perfectly imitated that they would delight the soul of a collector; for *la mode* demands not only that flowers be judiciously used, but that each be perfect of its kind.

The aspect of a millinery shop this season has been aptly compared to "Tom Tiddler's ground," for there seems no end to the bits of gold of every conceivable shape that are to be found therein. There are fillets such as the Grecian maidens bound around their heads, and there are coronets, clasps, embroideries and laces, while in combination with silk or net the glittering metal is wrought into new and

flare that invites a filling of roses or other flowers. This last style is especially quaint and picturesque in a dull-yellow Tuscan, banded about its edge with gold braid. The inside of the brim, where it flares, is filled with crush roses of the smart pink shade, and on the upper side is a roll of pink *crepe* that is drawn down at the edge and fastened under a tiny gilt clasp. Loops of pink grenadine ribbon stand up high in front, and the bridle is of *crepe*, its long, pointed ends being fastened with small gold pins. The net bonnets are in the same shape, though occasionally a veritable Nanon cap is seen.

Contrasts are liked in these dainty *chapeaux*, but they must bear the *cachet* of novelty. Apple-green and black, scarlet and black, and two shades of tan are in special vogue. A bonnet of apple-green tulle, drawn over a wire frame, displays a brim of black lace in frills, while full, feathery aigrettes of apple-green stand up somewhat defiantly at each side. The ties are of apple-green ribbon. Another, rather more striking, has a crown and brim of bright scarlet net, with a *bandeau* of out jets laid on the brim. Just in front are soft loops of black moire ribbon, and similar ribbons are used for

the strings that are knotted under the chin. Black bonnets are in vogue, but frequently they are brightened by clusters of flowers draped in net or by aigrettes of green, rose or brown.

Ribbons are approved as garniture for the front of bonnets and hats, but their arrangement is somewhat different from heretofore. Soft ribbon is generally used for the loops, which are high but not quite so aggressive as formerly, being arranged rather from the brim up to the crown than from the base of the crown to its top. Grenadine ribbons striped with satin, moire or brocade, heavy, soft grosgrains, rich moires and old-fashioned taffetas are all in vogue. It has been predicted that velvet ribbon will obtain later in the season, but this may be doubted. The ribbons are in many instances heavily lined with gold or some other metal, while the *ombre* effects, which seem to have had their day some time ago, have returned not for a day, but for a season. In green the shading runs the gamut from apple or Nile through all the tints to the very darkest, in brown from golden to seal, and in rose from the very faintest to the vieux-rose that is so fashionable. Great caution is needed, however, with regard to these *ombre* effects, for unless they are very carefully managed the result is apt to be crude.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

CRYSTALLIZED FRUITS.—The semi-annual meeting of the State Board of Horticulture which will be held at 220 Sutter street, S. F., on Monday, July 2d, at 10 A. M., promises to be of unusual interest, because at that time will be presented the essays on crystallizing fruits in competition for the prizes offered by the Board. There are two prizes to be awarded; one of \$50 and one of \$20. Those intending to compete should inform the Secretary of the Board, B. M. Lelong, at once.

THE CHICAGO PACKING CO., so impressively organized last winter across the bay by "Col." Wm. Selover of Chicago—an account of whose enterprise appeared in our issue of March 3, 1888—has proved remarkable as a failure. The plausible organizer failed to furnish any of the funds he had subscribed, the unfinished building stands on the ground encumbered with law-suits, and the whole business is at a standstill.

CRAWFORD PEACHES.—Onesti & Connor report the arrival of the first Crawford peaches this season, being sent in from the Winter's ranch of H. & W. Brink, and selling quickly at 12½ cents per pound.

We can supply any and all good animals that may be wanted, and at very reasonable prices and on convenient terms. Write or call on us. **PETER SAXE and HOMER P. SAXE**.
San Francisco, Cal., Oct. 22, 1886. **PETER SAXE & SON**, Lick House, S. F.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE!

FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KORSIG—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agriculture.
BERKELEY, Nov. 20, 1886.

DR. J. KORSIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade.

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

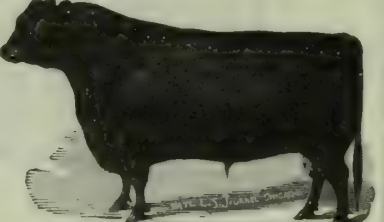

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

S. H. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 20, 1888.

Trade the past week in farm products, outside of cereals, has been quite active. The rainy, cloudy weather has been against grain maturing evenly, and at the same time has been against fruits, which at this season of the year, require clearer skies. The nutriment in the dry grass has been killed by the rains, which will operate against large owners of stock. The grain harvest is well under way. The wheat market at the East and abroad has been gradually receding the past week. The following is today's cable:

LIVERPOOL, June 20.—Wheat—Quiet but steady. California spot lots, 6 1/4 d to 6 7/8 d; off coast, 33 3/4 d; just shipped, 33 3/4 d; nearly due, 33 3/4 d; cargoes off coast, steadier; on passage, better feeling appears to prevail; quantity on passage to Continent, 616,000 qrs.; wheat and flour in Paris, steady; weather in England, cold.

Foreign Review.

LONDON, June 18.—The *Mark Lane Express* in its review of the grain trade, says: Supplies of English wheat are growing less; values are unchanged. The wheat-crop prospects are less promising, but the potato crop will be unusually good, and this, together with the large crop left over, will influence trade in breadstuffs. Flour is 3d cheaper. Trade in foreign wheat is slow. At today's market wheat and flour were against sellers. Australian and Russian wheats were 6d lower. Corn was 3d cheaper. Barley was dull and oats steady. Calcutta linseed is 3d cheaper.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	96 1/2	96 1/2	91 1/2	92 1/2	92 1/2
Friday	92 1/2	90 1/2	89 1/2	90 1/2	91 1/2
Saturday	91 1/2	89 1/2	89 1/2	90 1/2	90 1/2

Monday	90 1/2	89 1/2	89 1/2	90 1/2	90 1/2
Tuesday	90 1/2	89 1/2	89 1/2	90 1/2	90 1/2

The closing prices for wheat have been as follows, at Chicago:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	82 1/2	82 1/2	83 1/2	82 1/2	83 1/2
Friday	82 1/2	81 1/2	82 1/2	82 1/2	83 1/2
Saturday	81 1/2	81 1/2	81 1/2	82 1/2	82 1/2
Sunday	81 1/2	81 1/2	81 1/2	82 1/2	82 1/2
Monday	81 1/2	81 1/2	81 1/2	82 1/2	82 1/2
Tuesday	81 1/2	81 1/2	81 1/2	82 1/2	82 1/2

CHICAGO, June 20.—Wheat—82 1/4 c for cash, 82 1/2 c for July, 83 1/2 c for August and 83 1/2 c for Sept. Corn—5 1/2 c for July.

NEW YORK, June 20.—Wheat—81 1/2 c for cash, 89 c for June, 89 1/4 c for July, 90 1/4 c for August and 91 1/4 c for Sept.

California Products at Chicago.

CHICAGO, June 16.—On account of heavy receipts of peaches from the South there from California are having a slow sale. Boxes of 20 lbs sell at \$1.75. Plums are quiet with Royal Natives quotable at \$3.25 per crate of 20 lbs.

Cherries of very choice Royal Anne variety, in 10-lb boxes, sold at \$2.50, but sales are rather slow.

Oranges are steady, and trade in that fruit from California is only moderate on account of peaches and other green fruits being quite plenty; they sell as follows: California bright fruit, 1/2 box, \$4.50; 5/8 box, \$3.50; 3/4 box, \$3.75.

California dried fruits are ruling about steady at former prices. No changes to note in the general state of trade. The demand is mainly for bleached or evaporated apricots. For unpeeled peaches and for raisins, plums and prunes the market is slow. Prices are: Apricots, sun-dried, 1/2 lb, 8@9c; bleached, prime, 1/4 c; do., choice, 1/4 c; do., fancy, 15 1/2 c; evaporated, choice to fancy, 14 1/2 c; peaches, sun-dried, 1/2 lb, 9@10 1/2 c; do., evaporated, unpeeled, 1/2 lb, 14c; do., evaporated, peeled, 1/2 lb, 10@20c; plums, unpitted, 1/2 lb, 6@7c; do., pitted, dull at 10@11c.

Raisins, loose Muscates, 2-crown, 1/2 box, \$1.35 @1.40; do., 3-crown, 1/2 box, \$1.45 @1.50; do., London layers, 1/2 box, \$2.2 @2.25.

Prunes, small, 1/2 lb, 6@7c; do., fancy, large, dull, 8 1/2 @9c.

New California potatoes are slow at about \$1.65 per sack.

In consequence of warmer weather the demand for hops is somewhat improved. The supply is reported very small, and a continuation of good trade, it is said, will cause prices to improve, though as yet there is no change to note. Crop advices in the Eastern States are favorable only so far that the growth is somewhat irregular but the vines are very clean. English reports say that the yards are somewhat infested with vermin, but not to any serious extent as yet. We quote Pacific Coast, choice, 1/2 lb, 12@13c; do., common to prime, 10@11c.

Fruit Sold at Auction.

NEW YORK, June 18.—A carload of California peaches was sold at auction here to-day for from 65 to 85c per box. The fruit was forwarded here from Chicago, and was not sent by the California Fruit Union. It was in poor condition.

Wool.

NEW YORK, June 19.—Texas wool had good attention. Several full lines were taken. The market shows a degree of steadiness not noticeable for some time past. High qualities are quoted fairly firm, even with free receipts reported on the way. The worst of mills diminish. The reports of Philadelphia's business names only 380,000. Sales—10,000 lbs spring California, 18c; 7000, 18c; Texas, 13@18c; 5000 Texas, 17c; 3000 scoured Texas, 47c; 2000 half-blood, 33c; 10,000 quarter-blood common, 33c; 10,000 fine Territory, 17 1/2 c; 10,000 medium Territory, 21c; 2000 Southern, 23@24c; 25,000 fine delaine, 32c; 322,000 Texas, 40c; Noils, 6000. Fifty-nine bales of foreign on private terms.

Miscellaneous.

NEW YORK, June 19.—The latest wheat-crop re-

ports and estimate award only 50,000,000 bu. for exportation.

One carload of peaches by auction to-day brought 85c @ \$1.25.

Apricots are plenty, and, with trying weather, are down to 10@12 1/2 c.

There is more movement in hops; 500 bales sold at 10@12c; grades of State range from 10@13c; new Pacific, 8@11c; all old, 3@6c. Crop reports favor holders.

Raisins and barley are steady, owing to the warm weather. Two-crown, \$2.40 @2.65; 3-crown, \$1.50 @2.05; layers, nominal at \$2.60 @2.75.

Lima beans are firm at \$2.75.

Mustard seed is dull and has been offered as low as \$3 @6. The price of one rumored sale was \$2.50.

Hides are in fair demand, but mostly at concessions. There are holders at full rates for the best.

Local Markets.

BAGS—The market has been gradually settling until the range for Calcutta's at the close is 7 1/2 to 7 3/4 c. The latter for choice guaranteed.

BAKLEY—The market has held steady with a firm tone throughout the past week. The selling pressure is not large; there is more disposition to hold. On Call trading was light throughout the week. The following are to-day's sales:

Morning Session: Buyer 1888—500 tons, 94 1/2 c; 500, 95c; 200, 94 1/2 c. Seller 1888, new—200 tons, 85c; 100, 85 1/2 c @ c. Afternoon Session: Buyer 1888—100 tons, 94 1/2 c. Seller 1888, new—300 tons, 85c @ c.

BUTTER—Choice to gilt-edged is scarce and fetch good prices. Fair to good are in liberal offerings. Eastern butter glut the market at low prices.

EGGS—Strictly choice, fresh laid are wanted. Indeed the entire market is stronger and in better position. The demand is good.

CHEESE—Choice is steady at full prices. Fair to good is barely steady. The demand is good.

FLOUR—Cutting in prices of outside brands is reported. Standard brands are firmly held at full quotations. The demand is steady.

WHEAT—Millers report a great scarcity of choice, bright old. The stock of good to choice is light. In options, trading the past week was light; dealers appear disposed to await crop advices from Europe, and also from the Central States. The following are to-day's sales on Call.

Morning Session: Buyer 1888—300 tons, \$1.48 1/2; 1000, \$1.48 1/2 @ c.

[COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco, from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 '86 to June 18 '87.	July 1 '87 to June 16 '88.
Flour, qr. sks.	4,060,389	3,595,227
Wheat, cts.	12,753,189	8,267,000
Barley, cts.	2,234,857	2,261,518
Oats, cts.	134,472	157,704
Potatoes, sks.	842,851	1,119,235
Corn, sks.	125,813	239,476
Rye, sks.	27,784	18,490
Buckwheat, sks.	5,865	3,054
Beans, sks.	442,061	394,703
Brn, sks.	438,558	499,933
Hay, tons.	104,213	117,027
Salt, tons.	22,828	17,050
Wool, bales.	85,922	74,004
Hides, No.	108,657	105,555
Raisins, 20-lb boxes.	138,916	112,266
Quicksilver, flasks.	18,321	30,276
Hops, bales.	13,370	15,918

The receipts of certain articles of produce from Oregon, Washington Territory and other distant points, for the same period, compare as follows:

	July 1 '86 to June 18 '87.	July 1 '87 to June 16 '88.
Flour, sks.	254,560	430,262
Wheat, cts.	998,374	1,190,939
Barley, cts.	6,198	721
Oats, cts.	338,522	277,725
Corn, cts.	117,804	12,590
Wool, bales.	21,258	12,072
Brn, sks.	29,834	68,810
Hops, bales.	801	508
Hides, No.	35,834	32,947
Rye, cts.	5,827	5,827
Potatoes, sks.	144,834	82,365

Cereals.

The closing sales on the San Francisco Call Board were as follows:

The New York Produce Exchange Reporter in reporting on flour, says: "Winter-wheat brands continue in much the same general condition before noted. A great many holders talk confidently at least, owing to the unfavorable crop reports received from the winter-wheat States; millers in many sections are unable to buy wheat, claiming that wheat in the country tributary to their mills is nearly exhausted. Hence there is a reluctance about selling. A good many lots if sold at the price now obtainable could not be produced again at the same figures. Some holders are known to be refusing to offer supplies at the moment, but the general market lacks a positive tone and values do not keep well up to extremes. The winter-wheat States of Ohio, Indiana, Illinois and Michigan, suffered severely from climatic influences, and prospects for a minimum crop are patent. The Illinois State report, from returns to June 2d, says the outlook for winter wheat is discouraging. In but few of the Southern counties will there be even three-fourths of an average yield per acre on the limited area of wheat that has not been plowed up, while in many of the lead-

ing winter-wheat counties there will be from 10 to 35 per cent of an average yield per acre. The State Board of Agriculture at Missouri announced a decrease of 13 points in the condition of the crop since the May report, or 64 against 77. A prominent flour merchant has received from 23 reliable mills in Ohio estimates about the wheat crop. The acreage is given at 63 per cent, but there has been general improvement in the last month. The amount of old wheat is given as 20 per cent of the crop.

The total stocks of wheat in the United States and Canada on June 2d, out of farmers' hands, as reported to Bradstreet, from 950 points of accumulation, aggregated but 46,810,000 bushels on both sides of the Rocky mountains, against a total of 90,991,000 bushels five months ago, January 1, 1888, and as compared with 58,036,000 bushels reported to this journal one month ago, May 1st.

The decline in visible wheat stocks during the month of May, 1888, both coasts, amounted to about 11,200,000 bushels, as compared with a decline of 11,500,000 bushels during April last, and with a decline of nearly 19,000,000 bushels during the three months of January, February and March, 1888. Tabulating these decreases and contrasting them with corresponding declines in totals of the "official" visible supply stocks (east of Rocky mountains only) we find Bradstreet's reports show a decline of 44,444,000 bushels, January 1st to June 1st, as compared with a reduction of but two-fifths that quantity in official report:

	Bradstreet's.	N. Y. Prod. Exchange.
During May, 1888	11,238,000	6,047,818
During April, 1888	14,537,000	1,911,233
During Jan., Feb., March, '88	18,022,000	10,036,654
Total decrease	44,444,000	17,995,704

The decline in stocks of wheat from January 1st to June 1st, as shown by special reports to this journal, has been about 50 per cent, and as exhibited in official returns published by the exchanges but 41 per cent.

Comparing the two reports, for the region east of the Rocky mountains only, the figures are as follows:

	Bradstreet's.	N. Y. Prod. Exchange.
During May, 1888	9,400,000	6,047,818
During April, 1888	11,400,000	1,911,233
During Jan., Feb., March, '88	14,000,000	10,036,654
Total decrease	34,800,000	17,995,704

The total stocks of wheat at the dates named, east and west of the Rocky mountains, and east of the Rocky mountains, United States and Canada, as reported to this journal, were as follows.

	Bushels.	June 1.	May 1.	Jan. 1.
East of Rocky mountains	39,020,333	48,436,782	73,825,685	80,991,685
East & west of Rocky Mts.	46,800,333	58,036,782	90,991,685	90,991,685

During the next four weeks, to the nominal end of the crop year, the visible supply will continue to decline at a rate probably not less than 2,000,000 bushels a week. This points to a probable total visible wheat supply for the United States and Canada of perhaps 30,000,000 bushels east of the Rocky mountains on July 1, 1888. One year ago, on July 1, 1887, the total quantity of wheat remaining in sight, as reported to Bradstreet's, amounted to 38,620,000 bushels, two years ago to 33,460,000 bushels, and three years ago (1885) to 48,196,000 bushels. The stocks of wheat in sight to be carried over on the first of next month, it is perceived, promise to be the smallest for three years past—the period within which stocks held at northwestern interior elevators have been uniformly reported in these columns.

At the close of each season the market for cereals drag, and the one just closing is no exception. Wheat has the entire week been dull and listless. This condition is due more to dealers watching the harvest now under way and also the crops in the central States and in Europe. In this State the outlook is spotted. Many localities report a large yield and plump grain, while others report a light yield. But then there is no denying but it is much better than promised a few weeks ago, yet the acreage is small, owing to the large number of fields cut for hay, and the severe dry spell in the early spring drying up many hundred thousands of acres. This was given at some length in these columns a few weeks ago. It is an established fact, based on the very best information, that the surplus this year will not equal that of 1887. The tonnage to carry off the surplus is larger than at this time last year, which means a low rate of charters for the entire season. Silver is advancing abroad, which, if it goes up higher, will be against Indian and Russian wheat, but particularly the former. Crop advices abroad are poor, while in the United States the surplus this year is now estimated at about 40,000,000 bu. less than last year, while the stock of old will be about 10,000,000 bu. less than in 1887. Total shortage, 50,000,000 bu.

Oregon advices are essentially unchanged. Newspaper reports are to the contrary; the yield of wheat and barley in that State and Washington Territory will not be more than that of 1886, which was all of one-third less than last year's. The quality will be poor, and very much will be shriveled, although cool weather lately has very materially helped in filling out the kernel. The carry-over stock will not be as large as thought, owing to liberal shipments to this State and fair shipments to Europe.

In barley the market maintains a fairly steady, firm tone the past week. Trading was light, as were the receipts. Prices have been hammered low by the bears and cause well-informed to claim that it can only be a question of a short time before higher values obtain. This opinion is further strengthened by the short crop compared with last year and the large increased consumption. The loss of the dry feed on the plains, by the heavy rains, will stimulate the consumption still further, owing to the necessity of feeding "cut-feed." The supply of bright barley will be proportionately less than last year. Oregon advices report that the yield east of the Cascades will fall all of 25 to 40 per cent below that of last year, but it will be bright. Last year it was off-colored, owing to rains at the wrong time. In oats the market ruled dull and weak, except for choice, throughout the week, due chiefly to buyers bidding down and confining purchases to as small quantities as possible. The crop of the coast this year will be short. In the central States our advices report a

large increased acreage seeded and the outlook favorable.

In corn there is absolutely nothing new to report. Crop prospects continue good. In the central States the acreage planted is largely in excess of last year. The carry-over this year will probably be the least ever before known.

Rye is inactive but steady. Buckwheat is dull; nothing doing.

Fruits.

Cherries are growing scarcer, and consequently prices begin to appreciate. Apricots came in very heavily the past week, and as only one canner was buying up to Monday he cleaned up the market at from 2 to 2 1/4 c. On Monday other buyers came and prices did a shade better, running from 2 1/4 to 2 1/2 c. Canning varieties of peaches are not coming in yet. Those received sell low. For canning varieties canners still contract at about 1 1/2 c @ 1 lb, although as high as 2c has been paid for something considered extra. Mr. Wakefield, at Los Gatos, sold his crop of Muir's, at the latter price, to a canner. In pears 1 1/2 to 2c are named as the contract prices.

The shipments of green fruits to the central and eastern States have been heavier so far this year than ever before. This necessarily is of great assistance in keeping values up. In some localities fully three-quarters have been sent East.

Grapes are beginning to come in, but as yet they are confined to sample parcels.

The weather in the Coast counties has been against sun-drying. Cool, moist nights always make dark-colored and undesirable fruits when sun-dried. The stock of 1887 dried fruits is very light, but then dealers will not buy only to fill the small trade orders, even if decided concessions in asking prices are made, owing to the new season being near at hand. Farmers should remember that the best time, nine times out of ten, to sell is in the buying season, that is, when dealers are disposed to stock up; then any sized consignment can be placed, but at the tail end of the season it is hard to get buyers unless the new crop promises to be a failure.

Feedstuff.

Ground barely is barely steady; some cutting in prices is reported. Bran and middlings are lower under heavy receipts from Oregon. The consumption is increasing.

Hay, contrary to general expectations, holds strong. The crop in Oregon is short and that State like California has poor pasture this year which will require more hay for feeding. The rains in this State have taken the nutriment out of the grass on the grazing land, which will necessitate earlier feeding. The receipt of hay is only fair while the demand is good. The crop of volunteer this year was a failure, which has caused more fields of wheat, barley and oats to be cut for hay, but even with this increase it is doubtful if the supply will more than equal last year's, while the carry-over is smaller and the consumption is larger.

Live-Stock.

The market for dressed meat is quotable as follows by slaughterers to butchers (to get the price of stock on foot, take off one-third of the price for stall and grain fed and one-half from the price of grass fed, that is, animals running at large.)

HOGS—On foot, grain fed, 6 1/2 @ 6 3/4 c @ lb.; dressed, 9 @ 9 1/2 c @ lb.; soft, 5 1/2 @ 6 c @ lb.; dressed, 8 1/2 @ 9 1/2 c @ lb. Stock hogs, 4 @ 5 1/2 c @ lb.

BEF—Stall fed, 8 @ 8 1/2 c @ lb.; grass fed, extra, 7 @ 7 1/2 c @ lb.; first quality, 6 1/2 @ 6 3/4 c @ lb.; second quality 6 @ 6 1/2 c @ lb.; third quality, 5 @ 5 1/2 c @ lb.

VEAL—Choice 8 @ 9 c @ lb.; fair to good, 6 @ 7 c @ lb. MUTTON—Wethers, 6 @ 6 1/2 d @ lb.; ewes, 5 1/2 @ 6 c @ lb.; lamb, spring, 8 1/2 @ 9 1/2 c @ lb.

Choice bullocks are scarce and wanted. Choice mutton sheep are scarce and fetch better prices. Hard hogs are also wanted, and a desirable consignment can be placed at a slight advance. In milch cows there is nothing doing. In horses there is a slightly better inquiry. General utility horses fetch from \$150 to \$300 each. Single footers from \$200 to \$600.

Poutry kept strong up to Monday when the arrival of an Eastern shipment knocked values, but on Wednesday prices were again better.

Hops are stronger. The stock is light. In futures nothing outside of that heretofore reported has been done.

Tallow is scarce and wanted; as are deer skins.

Wool has a stronger tone but is not quotable higher. Sales the past week aggregate about 1,000,000 lbs. Miller & Lux are reported to be large buyers under the belief that prices are too low below foreign markets, even if wool is admitted free. Prices, they claim, will advance from 3 to 5c per pound. Choice grades of wool are scarce and wanted.

In beans there is nothing doing. The flax crop, it is said, will be short this year in Idaho and Eastern Washington Territory.

Vegetables.

Under a falling off in the shipping demand and continued free receipts, potatoes have fallen to lower prices with a weak tone at the closing.

As onions improve in quality the market strengthens, owing to a better demand both near and distant. The market closed firm.

String beans have dropped to figures which allow canners to clean up the market at from 1 to 1 1/2 c @ lb. Peas are steady, with canners still cleaning up the market when it is overstocked, and prices low. Green corn fluctuates from day to day. Tomatoes and cucumbers continue to recede. In other vegetables the market is regulated from day to day by the supply and demand.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1888.	1887.
On the way	435,851	276,119
In port, disengaged	76,754	96,288
In port, engaged	19,366	25,487
Totals	521,971	397,774

To obtain the carrying capacity, add 60 per cent to the tonnage.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JOHN G. H. LAMPADUS—Santa Barbara Co.
G. W. INGALLS—Arizona Territory.
A. F. JEWETT—Tulare Co.
C. E. WILLIAMS—Yuba and Sutter Co.'s.
R. G. HUSTON—Montana Territory.
WM. WILKINSON—Butte and Tehama Co.'s.
W. W. THORNTON—Solano and Sonoma Co.'s.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

AN Eastern manufacturer is visiting Marysville, and is seriously thinking of building a cotton factory there. He says cotton can be shipped at a less expense from Texas to California than it can from North Carolina to Massachusetts.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, IF REQUESTED the following articles (while this notice continues), at the very greatly reduced figures named at the right:

- 1.—The Agricultural Features of California, by Prof. Hilgard, 188 large pages, illustrated, cloth, with colored maps (full price \$1). \$0.25
 - 2.—World's Cyclopaedia, 794 pages, 1250 illustrations; (exceedingly valuable). 50
 - 3.—Dewey's Patent Elastic Binder (cloth cover), name of this paper stamped in gilt. 50
 - 4.—Niles' Stock and Poultry Book for Pacific Coast, pamphlet, 120 pages, illustrated. 25
 - 5.—Kendall's Treatise on the Horse and Diseases, 89 pages, instructive illustrations. 05
 - 6.—To New Subscribers, 12 select back Nos. of the RURAL PRESS, "good as new". Free
 - 7.—Any of Harper's, Frank Leslie's and most other first-class U. S. periodicals, 15 per ct. off regular rates.
 - 8.—Pacific Coast and Eastern Dailies, Books and Periodicals, except special publications, we can usually give 10 to 15 per cent off advertised retail rates.
 - 9.—March of Empire, by Mallie Stafford. 25
 - 10.—Life Among the Apaches, 322 pages, stiff cloth. 25
 - 11.—\$1 worth of choice seeds, to be selected from a list of 107 flower and 82 garden seeds, as previously published, or which list we will send on application. 25
 - 12.—Dewey's Pat. Newspaper Fileholder (18 to 36 in.). 05
 - 13.—European Vines Described, 63 pages. 05
 - 14.—Webster's Dictionary, 684 pages, with 1500 illustrations; very handy and reliable. 50
 - 15.—Architecture Simplified, 60 pages. 05
 - 16.—Mother Bickerdyke's Life with the Army; patriotic and ably written; 166 pp., cloth, \$1.00. 50
 - 17.—Ropp's Easy Calculator, cloth, 80 pp. 25
 - 18.—How to Tell the Age of a Horse. 06
 - 19.—Percheron Stud Book—French—bound in leather, 192 pages (full price, \$3). 1.00
 - 20.—What Every One Should Know; a cyclopedia of valuable information; 510 pp.; cloth; (full price \$1). 50
 - 21.—Knitting and Crochet, by Jennie June; 144 pp.; 200 illustrations. 25
 - 22.—Needle Work, by Jennie June; 128 pp.; 200 illustrations. 25
 - 23.—Ladies' Fancy Work, by Jennie June; 152 pp.; 700 illustrations. 25
 - 24.—The Way to do Magic; illustrated, 60 pp. 10
 - 25.—The Taxidermist's Manual; illustrated, 64 pp. 10
 - 26.—Beautiful Poetic Review, entertaining and instructive; 36 pages (a handsome and pleasing present). 25
- NOTE.—The cash must accompany all orders. Address this office, No. 252 Market St., S. F. Inform your neighbors about our offers and paper. In writing correspondence, items of information, or on other business, please use a separate sheet. Sample copies of this paper mailed free to persons thought likely to subscribe. Send for free circular describing most of these premiums, and any further information desired.

Books and Authors.

BY CALLIE L. BONNEY.

THE HUMAN NATURE LIBRARY, DEVOTED TO WHAT MOST CONCERNS BODY AND MIND. Edited by Nelson Sizer, President of the American Institute of Phenology, and H. S. Drayton, A. M., M. D., editor of the well-known *Phenological Journal*. Quarterly. 10c. a number, 30c. a year. Fowler & Wells Co., publishers.

No. 4 of this serial contains "The Choice of Occupation, or My Right Place in Life and How to Find It." Illustrated by Nelson Sizer, who has been the principal examiner in the Fowler & Wells office for forty years, and, skilled in the science, knows whereof he speaks. Mr. Sizer opens his able paper with this pertinent assertion: "If every boy or girl could be introduced to the line of industrial and economic effort to which he or she were, on the whole, best adapted, it would double the prosperity and material good of the next generation and greatly enhance the happiness of the race, besides abolishing poverty and nearly abolishing crime, as the choice of a pursuit is to a great degree the formation of a man's fortune and happiness."

Fairs of 1888.

Los Angeles—6 h Dist.—Live-Stock department, Aug. 6 to 11 (Hort. department, Oct. 6 to 11).
Napa—Napa Co.—Aug. 6 to 12.

Injurious Insects of the Orchard, Vineyard Field, Garden, Conservatory, etc.,

Remedies for their Extermination.

By MATTHEW COOKE.

Late Chief Executive Horticultural Officer of California. Illustrated with over 750 wood-cuts and 25 pages of classified illustrations. This book is designed for the use of orchardists, vineyardists, farmers and others interested in the subjects treated. It is designed to convey practical information concerning some of the species of insects injurious to the industries of cultivators of the soil, and those interested in earth produce generally. Price \$4, postpaid. For sale by DEWEY & Co., publishers, 220 Market St., San Francisco.

A Treatise on the Horse and his Diseases

By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7x5 inches. Price, only 25 cents, or five for \$1, on receipt of which we will send by mail to any address. DEWEY & CO., 220 Market St., S. F.

Jewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

HORTON & KENNEDY'S FAMOUS

ENTERPRISE Self-Regulating WINDMILL

Is recognized as the
BEST.

Always gives satisfaction. SIMPLE,
STRONG and DURABLE in all parts.
Solid Wrought Iron Crank Shaft
with DOUBLE BEARINGS for the Crank
to work in, all turned and run in ad-
justable babbitted boxes.

Positively Self-Regulating,

With no coil springs, or springs of any kind. No little
rods, joints, levers, or anything of the kind to get out of
order, as such things do. Mills in use 6 to 12 years in
good order now, that have never cost one cent for repairs.
All genuine Enterprise Mills for the Pacific Coast trade
come only through this agency, and none, whether of
the old or latest pattern, are genuine except those bear-
ing the "Enterprise Co." stamp. Look out for this, as
inferior mills are being offered with testimonials applied
to them which were given for ours. Prices to suit the
times. Full particulars free. Best Pumps, Feed Mills,
etc., kept in stock. Address,

HAY PRESSES!

THE HURRICANE—Size A.

A mounted, horizontal double-ender. Size of bale,
when in the press, 17x22 40 inches. Average weight of
bale, 220 pounds. Capacity, from 16 to 25 tons per day.
Uses 4 men and works with 2 h-rses. REQUIRES NO
TRAMPING. Puts 10 tons or over in a box car.

Price.....\$1000.

THE HURRICANE—Size B.

Size of bale in press, 22x24x46 inches. Average
weight of bale, 260 pounds. Capacity, from 20 to 35
tons per day. Uses 5 men and works with 1 or 2 horses,
at option of baler. REQUIRES NO TRAMPING. Uses rope
or wire. Puts from 7 to 8 tons in box in a box car.

Price.....\$1000.

MONARCH CAR PRESS
10 TONS BOX CAR \$300
MONARCH JR. 5 TONS BOX CAR \$200
THE MONARCH
IS THE BEST SMALL
BALER CAR PRESS IN THE
WORLD.

THE SELF-TRAMPING JUNIOR MONARCH

Size of bale in press, 22x24x46 inches. Average
weight of bales, 260 pounds. Capacity, from 15 to 25
tons per day. Uses 3 or 4 men, at option of baler.
Works with 1 or 2 horses. Uses rope or wire. Does its
OWN TRAMPING. Puts from 7 to 8 tons in a box car.

Price.....\$500.

THE MONARCH.

Same principle as Junior Monarch, only smaller and
heavier. Size of bale, when in press, 17x20x40 inches.
Average weight of bale, 220 pounds. Capacity, from 12
to 20 tons per day. Requires 3 men and 2 h-rses. Uses
wire only—rope will not hold. Does its OWN TRAMP-
ING. Puts 10 tons or over in a box car.

Price.....\$600

THE GENUINE PRICE PETALUMA.

Size of bale in press, 24x24x50 inches. Average
weight of bale, 250 pounds. Capacity, from 10 to 18
tons per day. Requires 4 men and 2 horses. Uses rope
or wire. Hay has to be tramped into the press. Puts
from 5 to 6 1/2 tons in a box car.

Price.....\$350.

THE IMPROVED EAGLE.

Size of bale in press, 26x26x50 inches. Average
weight of bale, 235 pounds. Capacity, from 10 to 15
tons per day. Requires 4 men and 2 horses. Uses rope
or wire. Hay has to be tramped in the press. Puts from
4 1/2 to 5 1/2 tons in a box car.

Price.....\$250.

The above is the finest line of Baling Presses in the
United States. They are nearly double the capacity of
those of other makers.

THE ERTTEL

VICTOR

Automatic Folder.

The Strongest, Fastest and Easiest Operating Baler Ever Made. Patented February 16, 1886, September 28, 1886, and May 10, 1887, by 44 Patented Claims of all New and Original Designs.

1888

1888

Guaranteed to Bale Hay or Straw Cheaper than any other. Full Weight to the Car. So Warranted or No Sale.

DOUBLE-ACTING PERPETUAL HAY and STRAW PRESS, A MACHINE IMITATED BUT NOT EQUALLED

In Symmetry, Simplicity, Durability, Ease of Management, Effectiveness of Power, Fast and Neat Baling. Needs but to be seen to be appreciated, and while the machine is only claimed to bale 10 to 15 tons per day's work, yet many parties using the Victor are baling over two tons per hour.

FOR REFERENCE WE NAME YOU A FEW OF THE MANY PARTIES USING IT:

MR. N. MATTHEWS, of Los Angeles, says his men have hauled with a Victor as many as 37 bales per hour (good weight).

CUNNINGHAM BROTHERS, of Glendora, say they have baled 4800 pounds of hay per hour.

MR. FRANK JOHNSON, Banning, says he is baling 6 tons per three hours.

MR. JAMES P. BURDICK, of Santa Ana, says the Victor is the only machine baling hay successfully.

POWELL'S PATENT DERRICK.

MOVING.

UNLOADING.

Derricks complete, with ropes and block (no nets).....	\$120.00
One long net for one wagon.....	22 00
Two short nets for one wagon.....	32 00
Powell's Patent Net Blocks, per pair.....	8 00
Powell's Patent Foot Blocks, each.....	5 00

IMPORTANT FEATURES.

The entire wagon load is hoisted up in a center opening net, by a self-braced Portable Derrick, which is moved from stack to stack ground without being taken down. Half an hour is ample time to move and set. Two nets can be used in each box, and the load taken out in two parts by having a partition in the box. Any farmer can at once see many advantages gained by the use of this invention.

One large or two small Nets used for each wagon. Parties having boxes longer than 16 feet should order two nets for each box.

In ordering nets, send inside length of box, and state whether one or two nets are required for each.

In Use Over 15 Years and never One Returned.

A Historic California Town.

Generally by a historic town in California we mean a town which has lived through the Mexican regime and continued through American occupation, but we refer now to a town which sprang up since the occupation and is one of the oldest towns with a purely American history. It is the town of Benicia, which was founded by the early American settlers and was designed as the metropolis of California. The place was made the capital of the State, and it seemed that the substantiality of the city was assured. But by one of those vagaries for which trade is noted, the scene of busy commerce shifted, the capital was moved, the interests which promised to contribute to a city's growth were dispersed, and the town of Benicia, with its wealth of natural advantages, is yet one of the smaller municipalities of the State, and awaits with never-dying hope the fruition of its early promise. It has a permanent population of 3000 or more. It is about 30 miles from San Francisco, and 57 from Sacramento. The Central Pacific railroad runs through the town, crossing the Carquinez straits upon the monster ferry boat Solano, which conveys loaded cars and locomotives across the stream. At Port Costa, on the other side of the straits, connection is made with the Southern Pacific railway, which runs to Los Angeles. There is thus a convergence of railway lines at Benicia and Port Costa that makes this locality favorable for manufacturing and shipping, and immense wharves and warehouses have sprung up, and there has been established, in some measure, the results that the early settlers of Benicia foresaw. But the interests are now scattered. Could they have been concentrated in Benicia, the city would be one of the most flourishing in the State to-day. The favorable conditions, however, are being more and more appreciated, and Benicia undoubtedly has a prosperous era ahead.

The site of the city consists of hills and sloping or rolling land. The heights back from the water front offer elegant building spots, and already numerous showy and pretentious dwellings are to be seen. The view from these elevated sites is fine indeed, looking out upon the turbid waters of the straits, and over to the highlands of Contra Costa county beyond. To the west, the waters of San Pablo

bay spread out, offering a water stretch as far as the eye can reach. The health of the residents of Benicia is excellent, as the climate is a happy medium between the dampness of the coast and the heat of the valleys. It is becoming a favorite resort for tired dwellers of the city, who can profitably spend their vacation here. It is now the site of a number of excellent private schools and of prosperous manufacturing enterprises, including the Benicia Agricultural works of Baker & Hamilton, the largest factory of agricultural machinery in the State.

Our view of Benicia looking toward the

Pasteurizing the Rabbits.

Our files of Australian papers bring accounts of the early experiments with inoculating rabbits with the germs of chicken cholera which Pasteur said would breed an epizootic among them and thus carry them off by myriads. The experiments began April 28th. A number of rabbits were inoculated with the microbes in the morning and placed under close supervision in isolated boxes, but on the following Monday the rabbits did not show the slightest traces of the disease, which, according to M. Pasteur, should prove fatal in about 24 hours. Critics

Co-operation.

The advocates of this grand idea of self-help for producers can find much ground for satisfaction in the records of experience which come from a distance, even if co-operation does not advance more rapidly at home. If the plan continues to demonstrate its success on foreign soil, it is only a question of time when it will adapt itself to our conditions and needs and thrive here. The latest encouraging information on the subject is contained in a recent article in the *Economiste Francaise*, and we present the substance thereof as we find it translated in an exchange.

The account refers especially to what are called "agricultural syndicates" recently organized in France. It appears that there are nearly half a million occupiers and owners of land who have banded themselves together through the medium of syndicates for their personal advantage. The first syndicate was formed upon a small scale by one of the French professors of agriculture, who obtained the assistance of the Consul-General of his department and a small subsidy, by means of which the organization was established. This did so well that the idea was taken

up and many other syndicates were formed. They have enabled farmers and others who are members to obtain manures 15 per cent less than they would have to pay if they were not members of those bodies. The arrangement also includes seeds.

Further than this some of the syndicates already supply machinery and implements to their members at considerably reduced prices, and sometimes guarantee the payment from the member up to a certain limit. The syndicate at Nantes goes beyond the purchase of goods; it provides experts to advise the farmer, and arbitrators to act in disputes which may arise between the owner and occupier of the land. The same syndicate has organized an insurance fund for the benefit of its members, as well as a register enabling them to obtain laborers as they require them. In Paris there is a permanent center of existing syndicates, which has been joined by nearly 200 societies representing 150,000 agriculturists; and they have already arranged, so that the stock-selling farmers can dispose of their beasts and sheep direct to the butchers at the great Paris market, La Villette,

VIEW OF A PORTION OF BENICIA, LOOKING SOUTHEAST.

southeast, shows a part of the town in the foreground. Beyond flows the magnificent Strait of Carquinez, a mile in width, connecting the upper bay of Suisun and the lower bay of San Pablo. Opposite lie the low rolling Contra Costa hills, while away to the southeast looms up the purple dome of Mount Diablo, as shown on the left of the distance in the picture.

WOOL FREIGHTS.—The agent of the Canadian Pacific gives the following account of reduced rates: Scoured wool we took at \$2 50, and now we can take it at \$2.25. On greased wool, valued at 12 cents a pound or over, our rates were \$1 63 a hundred. Now they are \$1.60, and on a valuation under 12 cents a pound, they are \$1.38 as against \$1.40.

CATTLE THIEVES COME TO GRIEF.—Mariposa officers not long ago arrested Jerry Culver and one Kendall on a charge of branding cattle, to which they pleaded guilty on the 19th inst. Culver was sentenced to two years in Folsom prison and Kendall was let go on his promising to leave the State.

were disposed to consider the experiment a failure and others thought the microbes had become inert through age and claimed that a fresh culture would give potent germs. On May 3d, however, three of the rabbits were found dead and the microscopists were proceeding to determine whether death followed from the suspected cause or not. This is the latest news contained in our exchanges. The reason assigned for the apparent failure in microbes in the first instance, is that they must lose a certain amount of vitality during the voyage, and though delaying the action of the disease germs they are not less sure. The Executive Committee were experiencing some difficulty in obtaining a suitable place to conduct the experiments. They asked for Shark island, Sydney, which they regarded as most suitable, but some objection was raised as to the possible danger to stock, which may in future be quarantined there. The matter was being considered by the Minister, who was being pressed for a decision as the Commission had no further time to waste in selecting sites. Probably our next mail advices will bring fuller accounts.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Industrial No es in Austria.

EDITORS' PRESS:—Vienna is a great city, and is the capital of a mixed population of some thirty odd million people. How so many million people can find subsistence in an area so limited is a question the more difficult to solve when we take into consideration that no considerable portion of this population are compelled to devote years of their time in the service of the State as soldiers. Add to this costly system of governmental machinery, so much so that real estate incomes are taxed as high as 40 per cent. (My authority for this statement is U. S. Consul here), and you will be puzzled the more for an answer, when you ask yourself the question: How do these people manage to exist? The answer is clear enough after due and careful examination has been made.

It would be an utter impossibility for these or any other equally large numbers of people to live here were they content to live on the produce of their limited territory. In addition to the production of that which their limited space affords, it would still be absolutely necessary to introduce and foster such industries as would tend to supply the deficiency. This the Austrians have done and are doing, and do it in such an orderly and systematic manner that their efforts in that direction are worthy our serious consideration, and with but few modifications they may serve us as models.

A few days spent at their *Hochschule für Bodencultur*, their *Handel's Akademie*, their *Technischen Hochschule*, their *Commercielle Akademie*, and a number of their other similarly inclined institutions would soon give light on the subject as to the manner of procedure of these people in the way of obtaining a permanent support. Thousands of young men are trained in these schools, receiving a thoroughly practical education in almost all the current branches of industry, art and science. I have visited several of these schools and have been shown through the various departments, and in some of them I have interviewed the professors and have noted down that which I believe may be of interest to your readers.

The *Handel's Akademie* I found to be a large building with a courtyard in the center. Contiguous to the class-rooms were the exhibition-rooms, in which were displayed in an orderly and systematic manner, and in their various stages or processes of growth, manufacture or manipulation the following: Furs, silks, feathers, hairs, cordage, textile fabrics, cottons, woods, bents, linens, fibrous materials, paper, paints, leather, dyes, nuts and hulls, tanning materials, ratons, reeds, tules, hat braids of straw, wood, etc.; palm leaves and their manipulation; ivory, bones, vegetable ivory, horn, cable, metal in sheets and wire; laces edging and embroidery; grain sacks, threads; plumbers' and gasfitters' tubes and angles and tools; machinists' tools and fittings; manures, eggs, snake skins, isinglass, wax earth and alkalies; colored and plain window, French plate and crystal sheet glass; grain, plumbago, pencils, metals, passementerie; coffee, preserved fruits, pulverized fruits, medicinal plants, seeds, rubber and gutta percha; drugs, precious stones, ores, meerscham, metal springs, stones, bones, leaf and metal. I did not have time enough to go through the other and larger departments.

Professors Pallota and Hassack conducted me on my tour of inspection. I asked Prof. Pallota what were the advantages to be derived from attending this academy. He replied by saying: "We aim to impart a practical knowledge of goods."

"What do you mean by that?" "An acquaintance with the most current articles of commerce in the whole world, their origin, structure, mode of production and distribution."

"What do you mean by an acquaintance with the most current articles of commerce?" "I mean an acquaintance and the obtaining a knowledge of and the countries and places in which they are found or produced, the forms in which they are found in commerce, essays as to their quality and their current and relative value."

"What value is this school to the commercial prosperity of Austria?" "I need only say that while Austria is commercially progressive, England without these schools is losing ground. Is not that an indication of its value?"

There are in regular attendance at this school 680 scholars, 30 professors and some minor teachers.

At the *Technischen Hochschule* I found an array of articles and materials similar to that described above in the *Handel's Akademie* with these additions. Working machines for textile fabrics, paper machines, agricultural and sewing machines, engines, models of houses, etc. In this school there were 1800 students.

At the agricultural school I found models and skeletons of men, horses, sheep, cattle, poultry, hogs, etc., in various varieties, stages and structures, beginning with the embryonic until maturity.

Forestry Laws.

In the evening I had an appointment to meet Prof. Adolf Ritter von Guttenberg, who is professor of *Bodenculture*. At this place I found varieties of woods and barks, principally of forest trees. Prof. Guttenberg is ranked as a

high authority in forest culture, and I therefore confined my remarks to that subject. "Have you forest laws for the protection of the forests?" I asked. "Yes, strong laws," he replied.

"What is the spirit of the law?" "What is forest must remain forest. Whenever a patch of trees has been ordered or allowed to be out, another batch of trees must be at once planted on the same ground, for it is strictly forbidden to devastate any forest or timber growing place."

"Who forbids it?" "The Government through an efficient force and commissioners, who are responsible and personally liable and answerable to the Government for the condition of the forests."

"This apparent arbitrariness of action on the part of the Government in the protection of the forests does not interfere with the rights of ownership and of property?"

"How can it? Do you not see that the Government has the right to so order an owner of property to so use his property as not to interfere with the best interests of the commonwealth? Yes, not alone a commonwealth, but even an individual."

"Will the use of the forests by the owner in any manner to suit his convenience do injury to the commonwealth?"

"Well, not in every instance. There is less to fear from forest destruction in the plains, but the real danger is in the mountains."

"What is the relation and value of forests to the commonwealth?" "First, it has an intrinsic value as a product of necessary utility. Second, in Austria there are many localities where wood is the natural and we may say the only possible product. Third, Austria has a great export trade for wood, hence it is a source of perpetual income. Fourth, the conservation of the forests is the condition for the maintenance of the highest state of agriculture; because the water percolation and flow is regulated to the needs of the soil moisture necessary to maintain plant life. Fifth, in the mountains the forests shield the fields and homestead from the destructive results of the avalanche, stone slides and land slides. Sixth, the forests are a condition to the attractiveness and beauty of the landscape."

"What is the result of the destruction of the forest?" "The answer is here" (showing me photographic views of Curusquet, Bourget, Barcelonnette, all of France). "See these barren sides of the mountains (I did), these were covered with earth and trees, now they are bare of earth and trees. In summer the sun rays reflect back from these barren slopes and the heat is intensified in the valleys. In the winter and spring these valleys are dangerous places of abode, for they are subject to sudden dangers to life and property; and the foothills and valleys that were once the homes of many people are now covered with stones, gravel and sand."

"Will not manuring the land by herding sheep, horses or cattle aid the restoration of the forests by reason of the manure they leave?"

"How can manure restore earth to places where the earth has been washed away? Besides there can be no greater damage to a forest, especially young forests, than to have cattle or sheep in them. You would not do so in a valuable orchard or vineyard; and a young forest tree is as tender as a fruit tree; besides there is always danger from forest fires by reason of carelessness or accident in camp fires, lighting pipes, etc., of the herders."

"Cannot the places where forests formerly were be replanted?" "Yes, they can; it is possible, but the cost is enough to stagger those who would attempt it, for in the first place you have to bring the earth and deposit it on the sides of the barren mountain; next you have the planting and care of the young trees, and when you have done all this you will have to scrape the valleys of the boulders, gravel and sand to find the original soil. Spain, Italy, and the Mediterranean countries, by reason of their almost incessant wars and by reason of neglect have lost almost the greater portion of their forests, and as a consequence, much of their land that was once in a tillable condition is now desert, and in many places they are obliged to resort to irrigation, for the absence of trees causes a scarcity of rain."

Preparation for Codlin Moth.

I thanked the Professor for his valuable information and asked him to tell me what remedy they use for codlin moths. He told me that it was a sort of glue, which is applied around the trunk of the tree in two bands, one about a foot, and the other about 20 inches from the ground. It is applied warm, with a brush, or cold with a smooth flat piece of wood. He gave me the address of a druggist, who, he said, could mix the solution. I called on the druggist and had him put me up a package, and also obtained from him the ingredients and quantities to be used, which I give herewith:

Resina pini, 300; Pix oil, 200; oil paraffin, 100; oil reparum crudum, 150; heat above until assimilated then add *acidum salicydicum*, 0.5. After this stir thoroughly.

In another boiler mix the following: Terebinth common, 100; vaseline (raw), 50; yellow beeswax, 100; balsam gurgun, 50. Heat and stir, and when thoroughly assimilated, mix with above first-named mixture and stir thoroughly. For "softening" use oil.

Packing and Preserving Fruits.

I next asked Prof. Guttenberg what is used in packing green fruit so as to preserve it as long as possible without rotting, and he said they use salicylic acid, as a powder, or dissolved

in alcohol, and the paper wrappings dipped in the preparation. They use it here, however, in the powdered state. It is not a poison. I shall send you a small box containing some. Also a sample of packing used in Italy, which I obtained from among a box of apples.

DAVID LUBIN.

[The codlin moth remedy, which Mr. Lubin sends, somewhat resembles shoemakers' wax. It might be well to try it. It would probably serve against all insects which crawl up the tree.]

The packing paper was more fully described in Mr. Lubin's previous letter. It is merely soft paper cut up by machinery into strips one-quarter of an inch wide. The same is used in this country for packing merchandise. It would seem better calculated to obviate jarring and to absorb moisture than the ordinary method of wrapping.—EDS. PRESS.]

THE VETERINARIAN.

Glanders—Equinia.

EDITORS' PRESS:—The word glanders is derived from the Latin roots, *glandula* and *glans*, the latter signifying a fruit kernel, the former, its diminutive, any small fruit kernel. The above terms are also used in medicine to denote the glands of the body, many of which are small, and compare in shape and size to acorns or other kernels.

This loathsome disease is generally the result of a specific matter, contaminating the surfaces and parts to which it is applied, affecting the organic functions, and giving rise to the changes characteristic of it.

The specific origin of glanders in the horse has not yet been demonstrated.

Symptoms of Glanders.

It is generally ushered in like catarrh or common cold. First, there is a slight discharge from the nose. The discharge at the commencement is scanty and limpid, amounting to nothing beyond a little aqueous or serous fluid, trickling commonly from one nostril only, but without intermission. In the course of a day or two this watery discharge mostly appears streaked or intermingled with ropes of mucus, and in a day or two after that it will most likely have become altogether mucous in its character, and glairy in appearance, after which it gradually assumes a yellow tinge, from the mucus being mixed with albuminous matter. We also have enlargement of the submaxillary lymphatic glands (the glands under the jaw), inflammation of the Schneiderian membrane (the membrane lining the nose), and the membranes lining the different sinuses of the head. There may or may not be palpable depression of spirits and disinclination to eat, but it is generally ushered in by constitutional disturbances; there will be more or less indications of fever, the pulse is quickened, roughness of the coat mouth hot and dry, and increase of temperature. I have known the temperature to reach as high as 107° Fahrenheit.

Generally after the first change has passed, as soon as the discharge from the nose is established, the animal improves from any indisposition he may have shown, recovers his spirits and appetite, and to a non-professional observer appears as well as ever. One of the characteristic symptoms often noticed in this disease in certain stages, is the good condition and feeling of health the animal manifests.

Second or Ulcerative Stage.

The discharge becomes copious from one or both nostrils of a sanious matter, and by degrees acquires consistence, exhibits true purulent characters. In time it becomes thicker, of a gluey character, and firmly adheres to the hair of the nostrils, collecting and concretizing to the wings of the nostrils, obstructing the aperture, and by this impeding the breathing. We also now find to be frequently the case, and which did not exist in the first stage, fetor, and that is often of such an offensive and peculiar nature that it is sufficient to enable a competent veterinary surgeon to swear to the case. I have only met with a few cases of glanders where fetor to some extent did not exist, in the whole of my 20 years' experience.

We now have the membrane lining the nose studded with small irregular-shaped ulcers, and at irregular distances from each other, they afterward coalescing. These ulcers also in time extend to the cartilages and bones (the septal cartilages and turbinated bones) producing a disgustingly offensive stench. The membrane becomes a dirty brown or leaden color, the discharge is sometimes streaked with blood, and a horse in the act of snorting blows masses of scab and exfoliated cartilage, and even bone will be thrown out. When the discharge is tinged with blood it proves that the ulceration is deep and extensive, or a disposition to ecchymosis, from some change in the condition of the blood.

We place more reliance on the ulceration than any other symptom to denote this terrible disease. Scratch the membrane and introduce some of the virus, the wound inflames and secretes an ichorous matter, and becomes converted into a vesicle. In a few days the vesicle will have broken, and in the place of it we will find a pale, foul, superficial ulcer, and in

the course of 24 hours it acquires the character of a glandular chancre.

Glandular Swellings.

The earliest external indication of glanders is enlargement or tumefaction of the submaxillary lymphatic glands. In cases of inoculation the glands are generally swollen on the third day. The swelling of the gland or glands is due to their sympathizing with the irritation going on in the nose, the same as buboes in man, occasioned by irritation going on in the organs of generation. The swelling at first is small and round and moveable, but occasionally the enlargement is so great as to lead one to believe the case to be one of distemper or strangles. These swellings at first are generally painful to pressure, and when first formed are generally loose and moveable; after a time it acquires firmness and apparently hugs the bone, the skin being drawn tightly over it. If the disease exists on both sides of the nose, the glands on either side will be enlarged.

They are rarely ever known to suppurate, but become hard and scirrhous in their nature. I will here remark that glanders, though especially affecting the equine race, is readily transmitted to man, sheep, goats, felines and rodents.

Glanders in the Human Species.

Without telling our readers, in a positive and unmistakable manner, the great danger they incur in attending to animals affected with glanders, or, in fact, coming in contact with them in any way, we would do them a great injustice, as this is a fell, dreadful, baneful, horrible and fatal disease, when man happens to be the victim. It is no less so in the case of the noble horse, but though a noble, useful and admirable animal, he is still of less importance than man, his quasi master.

Any of our readers who may have seen a man die from this disease, do not need to be spoken to on this subject, and to those who have not, we will only say, we heartily and sincerely hope they never will see such a sight.

This disease is liable, and I am sure often is mistaken for catarrh, nasal gleet (ozena) and strangles. The characteristic signs of glanders were with peculiar accuracy described by Solley-sell in 1664. "The signs by which the disease may be known are when a horse, already too old to be troubled with strangles, without a cough, voids matter by the nose, and has a kernel sticking to the bone; and besides in glanders the matter usually flows from one nostril, whereas in a cold it runs almost always out of both. Some cast the matter that is voided by the nostrils into water, and if it swims on the top they conclude the horse to be free of this distemper, but if it sink to the bottom it is a sign of glanders; the principal use of this experiment being to distinguish the pus. But you must not depend on the certainty of this sign, for if the matter sticks to the nostrils like glue, it is a bad sign, and you may conclude the disease to be the glanders, though the matter does swim on the top. When either the breath or matter that comes out of the nostrils stinks, the disease is incurable. I have seen horses troubled with this disease without kernels, or if there were any they were little and movable; and the only sign by which we could discover it to be glanders was the glueousness of the matter."

The late Professor Percival, M. R. C. V. S. L., of the English army, says in his *Hippopatry*, that "our diagnosis must be grounded first on the circumstances of the discharge coming from one or both sides of the head; secondly, on the nature of the discharges; thirdly, on the presence of ulceration, and the character of it; fourthly, on the presence and character of glandular tumefaction; fifthly, on the state of the animal's health; sixthly, on the presence of farcy; seventhly, on the absence of symptoms proper to other diseases."

A decayed molar tooth, has, no doubt, in several instances, led to a fatal diagnosis.

There are two forms of this disease, acute and chronic. If the animal does not die at once, the former invariably culminates into the latter.

Acute Glanders.

We see this form of the disease best marked from the result of inoculation, as I have before remarked; that, generally speaking, if inoculation has been successful, that on the third day there will be swelling of the submaxillary glands, slight discharge from the nostrils inoculated, and in four or five days ulceration will appear. These symptoms are sometimes accompanied by farcy. In this, the acute form of the disease, the symptoms rapidly increase to such an extent that they frequently terminate in death as early as 10 days from the time of the virus being introduced into the system.

Chronic Glanders.

This form of the disease consists of a discharge from the nose, from one or both nostrils, accompanied by enlargement of the submaxillary gland or glands. We have no inflammation of the membrane of the nose, but we have milary ulceration.

Chronic glanders generally attacks a horse in a mild form; the animal is in good health and spirits and his appetite remains good. If matter be taken from a horse suffering from this form of glanders, and a healthy horse be inoculated with it, it is probable that the acute disease will show itself with all its alarming symptoms. If a horse suffering from the chronic form should take a cold, or his health in any way be impaired, the acute disease will often appear and speedily run to the destruction of the

animal. All at once the discharge from the nose will greatly increase, his hind legs will frequently swell, and farcy eruptions break out all over the body. This is the form of the disease where we will most frequently find disease of the lungs from the malady existing in the system for a length of time. These organs after death are frequently a mass of ulceration and of a black hue. The duration of chronic glanders is very uncertain. It may continue months, and even for years, before the acute form may show itself, as in the case of the celebrated trotting mare Proteine, which case I was called in to see in consultation with the late Dr. G. Bowler, V. S., of Cincinnati.

We must not think that every horse that has a discharge from the nose for a length of time is suffering from glanders, for he may be suffering from nasal gleet, which disease I will treat on in some future article. Aged horses seem to suffer most from glanders, but at no age are horses regarded as exempt from taking the malady.

Causes of Glanders.

The cause of glanders may be considered under the heads of predisposing and exciting. Predisposition may lurk in breed, in constitution. It is evident that there exists in the animal economy of some subjects, peculiarities of constitution termed idiosyncrasies (through ignorance of a better name) which, under certain circumstances, and on application of the cause (indirect) develop the latent pathological fire, and thus they become glandered. Horses inherit constitutions; they also become predisposed to certain diseases, particularly affecting the organs of respiration, and with these to glanders. Horses that are kept in badly ventilated stables, or are overworked, badly fed, exposed to wet or cold, are most susceptible to any disease; so constitutional predisposition may be natural or acquired.

The Exciting Cause.

That this disease is both infectious and contagious under certain circumstances, I have very little doubt, as I have seen animals in different parts of the same building, though entirely separated as regards attendant, harness, buckets, etc., become affected with glanders. A glandered horse inhabits a stable, and has besmeared with his discharge the mangers, etc., leaving upon their surfaces desiccated matter. This, in a short time dries; it is only necessary for moisture and heat to render it active and operative again. A sound horse may be placed in the stable and not in the stall that the diseased horse was in, he inhales the effluvia caused by moisture and heat that arises from the desiccated besmearments, and those effluvia entering the lungs with the air he breathes, therein become absorbed, and thus affect the system, breaking out afterward in the form of glanders or farcy. It is beyond a doubt that the virus will lie latent for a considerable length of time. I have known cases where the virus must have lain dormant for three months. Another exciting cause is exposure to cold when hot, and this combined with the predisposition induced by the heat and impurity of the stables (and I can safely say that the air in some stables is almost putrid) perhaps more frequently produce not only glanders, but every other disease that prevails among horses.

Treatment of Glanders.

I regret to say that all the experiments on this disease have proved useless. Confirmed glanders has baffled all skill. Numerous are the remedies that have been tried, among them sulphate of copper, sulphur, chloride of sodium, sulphate of iron, arsenious acid, cantharides, chloride of barium, diiodide of copper, iodoform, etc. There is no doubt these medicines are excellent in cases of farcy, and will frequently effect a cure.

However, I will treat on the disease termed farcy in some future article.

DR. A. E. BRZARD M. R. C. V. S. L.

No. 11 Seventh St., S. F.

ARBORICULTURE.

Mr. Heath on the English Walnut.

At the Santa Barbara Fruit-Growers Convention there was considerable time given to the English walnut. The following is a part of the discussion embodying the experience of Hon. Russell Heath. It was an *ex tempore* address, and therefore has not the finish of an essay, but our readers will be glad to hear the experience of so famous a walnut-grower as Mr. Heath, and we trust the reporter has not obscured his meaning:

There is a great diversion of opinion among walnut-growers with regard to the culture of the walnut. I believe I am the first man in this county outside of the Mission priests who attempted the culture of the English walnut; I commenced it in 1858. I listened with a great deal of attention to the essay of Mr. Sexton (See RURAL PRESS, May 5, 1883) to find the history of the soft-shelled walnut. In 1858, there being no trees in California of the walnut species to be obtained, I procured of Mr. Wolfskill, in Los Angeles, the nuts to plant the first nursery in this county. There was no such thing known in California then as the soft-shelled walnut. Of the thousands of trees that I produced in

my nursery, I raised one tree only that differed from the original stock—walnuts having always been understood to be true to its stock. Those trees were planted in the fall of 1858, consequently the trees were started in the winter of 1858-59; when Mr. Stowe came here in the spring of 1873 he applied to me for walnuts to plant in nursery as he could not obtain sufficient trees to plant the ground that he was desirous of planting; I furnished Mr. Stowe with a large quantity of nuts; I had the previous year placed walnuts in San Francisco, and very likely it was from that lot of nuts that Mr. Sexton obtained his first soft-shelled walnuts, because the first soft-shelled walnut was produced from a nut from the Wolfskill orchard in 1859 in my orchard, and I was not aware of the existence of that soft-shelled nut until my attention was called by Mr. Stowe to the trees in the nursery produced by himself from seed obtained from my farm, and that there was one tree different from the other trees. He desired to know how it was that there was so much difference in walnuts where the seed all came from the same farm. At that time I was not aware of the existence of a bearing soft-shelled tree in my orchard, and wrote Mr. Stowe that at my first convenience I would go out to his orchard and examine those trees. I did so and found to my surprise the soft-shelled walnut, a walnut that I was not familiar with, that I never had noticed in my own orchard at all. We watched that tree and that same fall in gathering the fruit of my own orchard, my superintendent called my attention to the existence of a tree which he said was different from all the others, and wanted to know if he was to put that fruit with the other fruit? I said no; don't put it in if it is different, as I wanted to examine it, and went down there and saw by the leaf that Stowe's was a soft-shelled walnut, and that the soft-shelled walnut undoubtedly came from that seed that I had sold to Mr. Stowe.

Now my belief is that the soft-shelled walnut was a chance fruit obtained from the seed from the Wolfskill orchard in Los Angeles, because before that time there was no such fruit. So much for the soft-shelled walnut. It may or may not be true that the seed obtained by Mr. Sexton from San Francisco may have been from that which I had in San Francisco for sale, as I had seed in San Francisco for several years for sale, and, being one of the first experimenters in walnuts, I had no trouble in selling the fruit.

Seeking Location for Walnut-Growing.

With regard to planting of the English walnut, it is a question that I approach with a good deal of delicacy, especially as I am led to differ from our president, a gentleman whom I esteem as high as any man in the State, as to the poisoning of walnuts. My place of 200 acres was one mass of oaks, and there is not one single acre of the 180 acres now in walnuts but what had oaks that would cut from 4 to 15 cords of stove-wood, and yet I never lost a tree planted among the oaks. Now whether it is poisonous in the soil occupied by Mr. Cooper's orchard and not in the Carpenteria is a question that only the analysis of the soil can prove; but in my locality the oak is not poisonous to the young walnut. The great mistake, in my opinion in the raising of the walnut, is that a suitable locality is not first obtained. I saw as early as 1854 that California was destined to be what she is only now realizing—one of the richest States of the Union—and that in the soil was the secret of her success. Realizing that, and being ignorant of farming, for I never had held a plow in my hand in my life—never had lived outside of large cities—I looked from San Louis Obispo to San Diego seeking for lands where I might plant the walnut, the almond and the grape. I first went to Ventura county, and after a year and a half found that I had made a mistake in my selection, and looking around other localities I found in Carpenteria a dense jungle such as could not be found outside of Santa Barbara county, and said to myself: "If this will grow this jungle it will grow the walnut, the almond, and it must grow the grape," and I cleared that land at an expense of from one to one hundred and fifty dollars an acre and I planted the orchard that I now have.

Varieties.

With regard to the soft-shelled walnut and its profit, and the hard-shelled walnut, so-called, I claim that no living being can tell the difference by the kernel of the two nuts. A few years ago there was a company of Eastern people visiting our city, looking around; a good deal of talk had already been created with regard to the soft-shelled walnuts. As I was getting fancy prices I didn't object. I got as high as 50 cents a pound from nurserymen who were making a big thing out of the soft-shelled walnuts. I put out a nursery and planted 400 trees, and I have got all the soft-shelled walnuts I want, and when one dies I don't want another, and my objection is this: That they are too difficult to ship, too difficult to handle, too difficult to market. I say that no man can tell the difference of the quality; I was firmly of that belief, and I am firmly of that belief to-day. There were ladies and gentlemen present at my table, partaking of a dinner, and there were hard-shells and soft shells in the same dish because I made no difference in selection. They said: "Yes, these are very nice walnuts, but I always prefer the soft shell; they are much higher flavored, a much better nut." "Well," I said, "that is simply a difference of opinion; some might think the common walnut equally

as good," and while conversing I used my nut-crackers because I didn't want them to see that I could crack my nuts with my fingers, which I could do with all the nuts on the table, and I cracked the soft shells and the hard shells and placed the two in dishes by themselves and passed them around to the ladies and gentlemen present and asked them to kindly tell me which was the hard and which the soft shell and which is the higher flavored of the two. The test was made and two ladies announced that they had made the discovery. They declared that no such nuts could ever be raised on a hard shell tree. I had the shells; kept one. My wife was looking at it. She thought I was going to try the soft-shell walnuts because I contended that there was no difference. I said: "Which do you call the best nut?" They said: "Why this; there is no mistake about it, there can't be any mistake," and lo and behold! they had selected the hard-shelled walnut and that is the difference, simple fancy.

Planting.

Now in the distance of planting the soft-shelled walnut—and I must refer a little to Mr. Sexton's essay with regard to transplanting trees—I don't know much about this thing, but I have experimented and that is the only way I had to learn. I didn't know anything about horticulture. I had everything to learn from books and experiments and all the knowledge I have was by books and by experiments. I commenced transplanting trees in my nursery at one year old. Each year I renewed my nursery rows, planting each year so as to enable me to have trees for my own land, which I was obliged to clear in order to prepare it for the orchard. I planted after the first year, I planted after the second year and continued that planting year by year from three different nurseries of different ages. When I arrived at the ninth year of the planting, my trees had then been in bearing one year in the nursery, and now this is the result as my experiment goes: The trees that I planted out one year will bear their fruit the seventh year. Now, with regard to the bearing of the walnut in four and six years and seven years, let me say this right here: That in its native country, Persia, it bears at eight years and never was known to bear in less than eight years. I know that California is excellent, I know that it excels in many respects, but I say Persia is good enough for me. Eight years from the seed is as soon as I ever had the walnut bear in my orchard. I planted the one-year-old tree, the two year old tree; I lost the two-year-old tree. My experiments prove that two years is an unnatural time to transplant the walnut. I will tell you why. The first year the walnut makes from three to seven inches without irrigation (and I should advise any man who desires to set out an orchard not to buy irrigated trees). There are two periods that the walnut ought not to be transplanted—that is, the second and after the fifth year. The root starts the second year and makes a partial growth and then it divides itself between top and root.

I will ask any Walnut grower that has watched his nursery, if that is not correct; the walnut will start and grow in root first without starting at the top until it has made a certain period of growth, and then the root grows if not forced. I want to emphasize that matter of forcing trees because I can take a fig and make it grow 10 feet from the cutting by forcing it. I can take a walnut and make it grow 10 feet the second year, but I say that is an unnatural growth and it ought not to be indulged in. The second year then is dangerous for transplanting; it is the period between the top and the root and when you take it up you destroy that growth, which may be owing to the root or to the top. The third year it makes top alone, comparatively no root. It is then that your little tree 12 inches high grows up to the height of 12 feet; it is the top that is making that year and of course you do not desire to transplant a tree that is all to top and not root, because when you take it from the nursery rows you must allow that tree to go down and make the root first before it can make the top. After the third year you can transplant it with safety. Why? It has made its top. The fourth year its tendency is to root and not to top because on the fourth year it makes its spurs two inches on the side of that growth of the third year. The tendency of that year is all root and if you want to transplant a young tree, then take up your three year old tree and transplant it and you will get your fruit then as quickly as the age of the tree will allow it to bear. After the fifth year the tendency is not to make root; then is the time those little branches two inches long send out the long arms to the distance of seven or eight feet; then it is that you want more care in your orchard than at any other time; then it is that your tender shoots, especially in exposed conditions, are liable to be cut upon the end by the frost; then it is, if you are in the interior, that one hot blast will kill the ends of every tree you have. The only remedy is then the knife, which any orchardist can tell when and where to apply; because when the tree is touched by either cold or heat you will see it by a little mark of black and you must use the knife below that black mark. I have never lost a walnut when I took that means of preservation. Transplanting six year old trees, my experience is that I never have had a nut from my trees that I transplanted from one year old to seven without waiting six years; Mr. Sexton has raised them in four years, I do not dispute his word, I only state my experience that I never have produced a

walnut in six years except as I am about to tell you.

Bearing Age in Nursery Rows.

In my experiments remember that I made them from three nurseries, growing at three different periods of time. I transplanted my trees after they had passed the age of bearing in my nursery rows; of course nurserymen cannot afford to raise trees of that description, but a man who stakes his money and his time upon an orchard can afford to wait; it takes time and requires money, but no man can succeed raising a walnut without the expenditure of money and time.

I transplanted 800 eleven year-old trees and did not lose one in transplanting, and last year I had fruit upon more than two-thirds of those trees. Two years ago I did not transplant because the season was not favorable. This year I have transplanted 600 trees more than 12 years old, and I will get fruit from those trees just as soon as the top forms, because I cut the top entirely off at 8 or 9 feet from the ground, regardless of limbs. I cut the top square off and some of my neighbors who came and saw what I was doing said I was putting out hitching-posts. I have a thousand out, and I wish I had 20,000 more, because those hitching-posts are now bearing and putting money in my pocket, and so I say to-day I had rather give \$10 for a tree that is nine years old than to give one cent for a tree that is four years old. I say there is money in it because it cost me no time to cultivate in the nursery. One man will go through a nursery and cultivate a thousand trees in a half a day, and if you place those trees in an orchard you are at great expense. Teams and men cost money; you can buy teams and hire men, but I tell you that even in California, with all its fruitfulness, you can't buy brains to drive those teams; that is the trouble of every single orchardist that does not do his own work.

With regard to the profit of the English walnut, you need have no fear. Plant your walnut; you have an investment safer than anything in these United States. There is nothing that yields so certain as the English walnut; there is no off year. You can hold your price better and the money will flow year by year, as every orchardist that has his orchard in a good place will tell you if he tells you honestly.

The Tap Root Question.

Now with regard to cutting the tap root: I did not know anything about walnut culture. I was more indebted to these priests at the Mission than any knowledge I could get from books. I went to Sansavain and Wolfskill, who had been in the business for many years, but I tell you that the observation of the cultivators of these trees in Los Angeles was of very little use to me; they could not even tell me whether there was two blossoms on a walnut tree. When I found out that there must be two blossoms in order to bear its fruit, and I wanted to know whether those two blossoms were on the same tree or on different trees, I went to Los Angeles and propounded that question to Mr. Wolfskill and Mr. Sansavain, experienced men in the business. They said: "You are the most inquisitive man I ever heard of in my life; never heard of such a thing there; I don't believe there is any blossom at all." I said: "Do all your trees bear? that is the question." "Yes, they all bear." Then I say they all have blossoms, and they all have two blossoms, and I watched my trees when they came to bearing this year, and lo! and behold! I found the two blossoms which they had never noticed. Now some wiseacre that thought he knew more of the cultivation of nuts than any other man in California, discovered in Los Angeles that if you cut the tap root your tree would never bear, and that was published in the papers throughout the State. I said: Here is a pretty kettle of fish again. I have cut all the tap roots in my orchard, and I don't know whether I am going to have any fruit. I will see about this thing. They said that where the tap root is cut, there the decay would commence, and an insect would attack the root and eat the life out of the walnut, and it would finally die. I determined not to be fooled much longer in spending more money, and took two men and went right down in my orchard. I could not make any mistake because I had cut off every tap root in the orchard. We dug down carefully by the side of the tree; I was going to be very careful about it, and I had a large magnifying glass and took that with me, and after they got down below where the tap root was cut I got my magnifying glass, and said: "Boys, you needn't use your shovels any more; I want to get at this thing with my hand," and took my glass and went down in the hole. I commenced digging like a gopher, and when I got down to where the root was cut, to my surprise there were two tap roots, beautiful as could be, sent out from the place where the tap root was cut. I examined five trees in that way, and each had two tap roots, and I made up my mind that the Los Angeles men that had been writing about tap roots were in a dream.

WRITE ON YELLOW PAPER.—A gentleman who has made a study of the eye says, for the benefit of the people who have to earn a livelihood with the pen: "Never write on white paper if you can get yellow paper. A sheet of card of the same shade placed on the wall over the desk will assist in giving the eye rest, and thus will facilitate the work." He has made this suggestion to many, and in each case has received the thanks of those benefitted.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Grange Work and Progress.

[Contributed by MORIMER WHITEHEAD, Lecturer National Grange, P. of H.]

While the Grange, as an organization, is in no wise a party organization, and the discussion of partisan politics and sectarian religion is prohibited in its meetings, yet it is doing a great work in bringing about a purer atmosphere in the politics of our country. It does not try to make every member a Democrat or every member a Republican, but it does make better Democrats and better Republicans. It teaches the farmer to "affiliate with any party that will best carry out his interests," to "see that none but faithful, honest and competent men are nominated for all positions of trust, men who will unflinchingly stand by our industrial interests." And further, it encourages each member to do "all he can in his own party to put down bribery, corruption and trickery." Better men are being nominated in all parties. The power of the Grange education in this direction is being felt in all parties. Farmers are not only the balance of power in all parties, but the power itself. Parties are all right in their place, but the people should run the parties, and not the parties the people.

The Independent Voter.

"A few years ago the man who had the moral courage to refuse obedience to party mandates, and dared to be true to his convictions of right, was ridiculed and jeered at on every possible occasion. The vilest and most opprobrious epithets were heaped upon him, and partisan zeal applauded the man who excelled in this dirty work. But a more enlightened sentiment has entirely changed public opinion in this respect, and now no one entertains other than a feeling of contempt for the fellow who violates his sense of justice and honor, and servilely bowing to party dictation, joins in supporting improper nominations, no matter how corruptly secured, and blindly follows a leadership that seeks only self-aggrandizement.

The independent voter is the hope of the country. It is he who, being impelled in his course of action by something higher and nobler than mere partisan feeling, interposes a barrier to the onward sweep of the flood-tide of corruption that compels it to stop. Both political parties recognize the potency of this new factor in politics, and are casting about for men to place on the respective tickets who possess the confidence of the people. How silly for our citizens to suffer party feeling to influence their conduct in the selection of those who are to fill our public offices. What we need is men who are competent, honest, faithful and courageous; and when political bosses foist upon the ticket men deficient in these qualities, it is the duty of every good citizen to repudiate their action and support a man who does possess them."—*Farmers' Friend*.

Progress.

The Secretary of the Rhode Island State Grange writes: "We are getting along nicely, and the benefits are already apparent along the line. Our 15 Granges now number 670 members, an increase of 82 over last quarter, and little Rhode wouldn't cover one county of some States. Young and growing. For the cause."

South Carolina Patrons are arranging for their second annual summer encampment, lasting one week in August.

Sedgwick and Capitol Granges, Connecticut, have each resolved to hold a cattle show next fall.

The last "children's meeting" of Worcester Grange, Massachusetts, had 350 present. Music, recitations, supper, and a varied program was successfully carried out.

The 16th annual picnic—exhibition at Williams' Grove, Pa., at which upwards of 200,000 persons attend each year, will this year be on a more extended scale than ever. President Cleveland has accepted an invitation to be present.

Active Grange work is now going on in Minnesota under the direction of State Master W. S. Chowen.

BRO. PUT. DARDEN, Worthy Master of the National Grange, will visit Texas in August to attend the session of the State Grange, which convenes on the 14th of that month. It is to be hoped that the Worthy Master will honor the California State Grange with a visit next October. Such a visit would be appreciated by all Patrons in California, and, no doubt, would be the means of calling a large number of

brothers and sisters from Oregon, who would willingly travel that distance to be able to meet and confer with Bro. Darden. By all means Worthy Master come to California. Set the first example of a National Master's visit to this coast, and see what we will do for you and the National Grange in return. We need your help, and all will try to make you and other Eastern brothers and sisters who will come with you, more than pleased.

San Jose Grange.

EDITORS PRESS:—We had an interesting meeting to-day, presided over by the Worthy Overseer, Sister L. J. Watkins, with dignity and executive ability considering she is only a woman. Bro. Pomeroy is up in the mountains rusticated, and I presume will have some big fish stories to tell when he gets back. Bro. Jones gave us an interesting paper to-day, upon "What the San Jose Grange had accomplished since its organization," which should encourage us for future effort. The benefit which may be derived from co-operation, was clearly shown in the successful operation of the Farmers' Union of this city, which was started by the Patrons of the Grange, although now conducted as a corporation. The subject of co-operation is still before the Grange, and the committee appointed to investigate the subject have from time to time reported progress.

Last week Sister Hamilton gave us an interesting paper on the subject. In fact, whichever way we turn or whatever we do, we are forcibly reminded that there is strength in co-operation. It has been suggested that the farmers co-operate in the selection of their local officers with a view of promoting and securing their own interests. As it is now they are a very small factor in politics, when they should be a tower of strength, and united they would be. In the matter of State dues we decided to pay 20 cents for each member in good standing, until the next meeting of the National Grange. YELLAFO.

San Jose, June 23d.

A BOGUS PATRON.—Bro. J. H. Hale, Master of the Connecticut State Grange, writes that they have caught and jailed a fraud, who has been visiting Patrons and Granges in his State, and, on a plea of being in distress, obtains money to assist him on his journey home. He says he belongs to a Grange in West Virginia. We do not believe he ever belonged to a Grange in this State, but a few years ago a fraud claiming to live in Kentucky, who was posted in the unwritten work of the Order, visited several sections of this State and obtained money in exactly the same manner in which the man has been operating in Connecticut. *Farmers' Friend*.

A GRANGE NEEDED IN SHASTA COUNTY. Sister Lizzie Bowman, writing from Ono, Shasta county, Cal., June 22d, says: "We have no Grange at Ono, but hope by another year at least to break ground, as we have some good solid timber for the foundation to begin a good Grange Order with. We talk Grange all the time, and when Saturday comes around we feel like lost sheep in a strange pasture. We miss, Oh, so much! those pleasant meetings and the kind greetings of our brothers and sisters; but we shall have to bide our time, and hope before the close of another year to have a good healthy Grange at Ono."

BRO. J. M. MOORE has been appointed District Lecturer for Tulare county. We hope he will set a good example by writing to his fellow deputies and Patrons often through the PRESS. Also influence other good quills to scribble for us and exchange their ideas with the rest of the world.

BRO. D. O. HARELSON, of Tulare, writes to Worthy Master Overhiser that an experiment station has been established at that place, and that Grange influence had been an important factor in obtaining this result.

JUDGE KEYSER, of Marysville, fined James McIntosh \$500 on the 25th inst. for violating the anti-debris injunction. Other cases of the same nature are being tried.

WHEATLAND GRANGE mourns the loss of a loyal sister, Mrs. Dora Bennett, and has adopted resolutions of respect to her memory and sympathy with her bereaved family.

MRS. E. MAPLES of Tulare Grange has been appointed a member of the State Grange Literary Committee by Worthy Master Overhiser.

FREIGHT ON CANNED FRUITS.—A part of the concession asked for by the shippers of California canned fruits has been allowed and the rate will be \$1.10 instead of \$1.25 as announced June 14th.

PUBLIC AFFAIRS.

Our Local Interests in Tariff Reform.

(Being intended as a prize essay, in answer to an offer by the Reform Club of New York City, of \$250 for the best essay, and \$100 to the publisher, open for all parts of the United States.)

CHAPTER II.

God has a tariff that is felt and seen
In every league of land or sea between.

Yes, there is a natural tariff that covers the whole earth and affects all people. It is the tariff of transportation. Home produce always has that in its favor. It may be reduced to its lowest terms, but it never can be escaped.

The cost of transportation is forever in favor of the home producer.

In times past it was a most important ingredient in the price of commodities. When the best conveyance was a pack-horse even fine flour could not travel a hundred miles unless by water; hence little mills dotted the land, vegetables were not carried save to the nearest town. An excessive crop in any locality reduced prices to nothing, and a famine that reached a hundred miles round was a dreadful calamity.

We have largely overcome this element of cost by the aid of ships and railroads. Ere the Pacific railroad was built a pound of tea could not cross the continent without doubling its price. Now five cents will leave a profit to the carrier. Then grain, vegetables, fruits, were confined to a market close at home; now they cross the continent or go round by sea. California is the tea landing for all the continent, and sends her plums to be eaten in New York. The science of transportation is killing this natural God made tariff. In the near future it threatens to be almost extinguished.

And this is a natural consideration in devising a tariff system to protect the special business of one section of our country in other and remote sections against the products of foreign countries nearer to hand and with a less cost of transportation.

Thus in the New York fruit market, Spain, Portugal and all the Mediterranean coast have a cheaper access by sea than California. Shall we favor California and Florida by a tariff, or take these supplies from strangers. When a question of this kind arises, there can be but one answer. It is money saved to our great family, all of which tends to circulate and come back to us, enrich the whole family and make us more self-dependent. Let us do it!

Pennsylvania produces iron, but England, France, Germany, all as near to California as she is, produce iron also. Shall these strangers supply all our far West, or shall we aid the natural tariff so as to throw our business to Pennsylvania? Clearly the latter is indicated, for the same reason as before. We should give our own States the preference in all such things as they produce in abundance, and the difference in price or access favors the stranger. We shall take care to neutralize any advantage he may have over our own brothers, which the natural tariff does not equalize and aid it by a protective tariff of our own.

But this principle, once admitted, must go all around. It must favor every State alike. Any State able to say: "We produce coal, iron, oil, wool, cotton, wheat, sugar, in great excess. We want to sell it to our sister States. Some of them are so remote from us, or so near to strangers in the same business that we cannot do so. Give us a little aid." We conceive it to be a bounden duty and the best policy to do so.

But some consideration must be had as to the amount of the protection required, and the general effect on the whole country. Is the industry of National importance? Is the protection for healthy purposes, to expand commerce, or to foster monopoly? Its effect on those who are to be damaged by the protection and the high prices demanded in consequence. The exact amount to be collected, and whether it shall prohibit or only tax and discourage. And shall the taxation be for revenue alone, protection alone, or a mixture of both?

Let us suppose a case to illustrate how this tariff to neutralize location and cheapen transportation would operate.

Suppose we discover exhaustless and widespread lodes of iron ore in the center of our domain so as to be accessible to all workers, both great and small. It might be good policy to protect that industry so that not a pound of iron could come into the United States from any quarter. We could say we have enough! We have no need to import. To the remotest bound of our domain they shall pay transportation on that iron rather than buy from abroad. It would perhaps be wisely done. Prohibition would be to our best interest.

Now suppose that though the iron were plenty, yet it was in few hands, a combination, a trust; and all the protection would go to the trust. Surely it would be madness to protect.

Let the iron be so situated that though open to all, yet for many years sufficient for all our use could not be produced, then prohibition would be absurd and suicidal. A judicious tariff would be the thing, to make a good demand for what could be produced and encourage further development.

And this should yield gradually till the works could supply all our wants, then merge into pro-

hibition, to protect our own works and employ our own people.

It is contended that in most articles demanding protection, the operation would be the other way. Most of our manufacturers declare that protection is only to be temporary, till they acquire practice and skill and plant, when they will defy competition, dispense with the tariff and throw their goods on the world through open doors, as our wheat growers do.

In this protean shape does the tariff question come to us. Its object and ultimate, its quantity and quality, its victims or its beneficiaries, whether for protection or revenue, are questions that change with each item you name on the list. From attar of roses to coal, every article has a history and status of its own. It is not a question of protection or no protection. It is simply one of revenue, so levied as to do the most good and the least injury. A judicious revision as the President observes, is precisely what we want; not under a craze for Free Trade, nor with a false pretense of protecting labor; but, "To raise the revenue required, and no more, in such a manner as to conduce to the best interests of the whole country."

To do this with the best effect, we must classify the articles on which we exact our custom dues.

There are those we do not produce, do not expect to produce, and do not desire to produce, as tea, coffee, spices, etc. Take the whole class and divide them into two parts, necessities and luxuries. Tax the luxuries and let the rest go free.

There are articles that do us no good, as diamonds, jewels, perfumes, patent medicines, and all manner of useless finery. Tax them well. The buyers can afford to pay, and should, for retiring their wealth from the channels of usefulness.

There are articles that lead to evil continually, that are worse than a dead loss to all who use them, and to the Nation at large; tax them all, the traffic will bear, without too much encouragement to perjury and smuggling. Commit the Government for once to the side of virtue and order. Keep the taxes on all intoxicants, tobacco, opium and all of that kind, and pile them on. No good man will be injured thereby, and no bad one has a right to complain.

Let all the necessities of life for the poor go free, unless there is some irreputable reason for protection. Then protect judiciously.

All this done, wherever there is any industry that needs protection give it. Sum up your revenue. If you have sufficient, stand fast. If not, put what you need on the first class named. X. K.

Killed in a Harvester.

Ed. Patterson, a steady, hard-working young rancher, well known and liked in Southern Butte, lost his life suddenly on the evening of the 21st by getting caught in the gearing of a combined harvester.

It appears from the Gridley Herald that Mr. Patterson had been getting the machine ready for the season's work on Warren Green's ranch, and proceeded to try its working. He had started the team and was walking beside the main driving-wheel where he could see the cleaning apparatus. He could not be seen by either of his three companions, one of whom was driving the team, another was at the sack-sewer's post, while the third was on top watching the cutting attachment. Suddenly Patterson yelled, "Whoa!" His cry was heard and the ponderous machinery promptly stopped. As it came to a stand he was heard say: "I'm killed!" He gasped once or twice, but did not speak again.

His body was wedged in so tightly that it could not be extricated until help was procured from neighboring ranches and the machinery unguarled. The position of the body indicated that he had stumbled over a clod and thoughtlessly grabbed the chain-belt with his left hand. His neck was dislocated, left arm broken in three places, head and chest bruised and mangled.

Those who work about powerful machinery while it is in motion can hardly be too careful; they certainly cannot afford to become careless. "Eternal vigilance is the price of" life itself.

NOTABLE SALE TO COME.—We give early preliminary notice that Robert Ashburner, the well-known breeder of milking strains of Shorthorns, has decided to sell at public auction on August 16th, his famous Baden farm herd of Shorthorns. Mr. Ashburner sells because of the expiration of the lease of a part of the land he has occupied for a number of years. This sale will give opportunity to secure some of the best milking Shorthorn blood in the State, and all breeders should make note of the date. The sale will be by Killip & Co. on the farm at Baden station, San Mateo county. Fuller particulars will be given later.

HORSE AUCTION.—The combination sale of track and road horses, brood mares, colts, etc., by Killip & Co., at the Bay District track on Wednesday was well attended and the amounts realized were generally satisfactory. Names and prices will be given in a later issue.

ARTIS GRISELDA, one of the new accessions at Jersey Farm from Smiths, Powell & Lamb's Holstein herd, has been giving from eight to nine gallons daily on ordinary feed for a month past—so Mr. Sneath informs us.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

ABOUT LIVERMORE.—*Herald*, June 21: Wheat is ripening fast.... Our vine district is now a scene of beauty. The grafted vineyards are coming out finely, many of the young shoots being already stake-high.... The berries are setting on Chas. A. Wetmore's olive orchard. The crop is full, being all the trees should bear.

RECLAMATION.—The Rose-Black canal is now excavated to a point some distance above the bridge on the hill road between Pleasanton and Dublin. This first half mile is the worst part of the work. The depth ranges from 8 to 14 feet. The earth is lifted by means of derricks, the team walking away on smooth ground, and pulling a scraperful of mud up the steep bank at each haul. The soil is an alluvial loam, with streaks of clay. An occasional quicksand is encountered, which causes slides in the bank. The opening of this canal will sink the water level on the entire "bolea," and reclaim thousands of acres of fine land.

Contra Costa.

ALMONDS THRIVING.—*Antioch Ledger*: We have before remarked on the vigorous growth and unfailing productivity of Mr. Graves' almond orchard. He consented reluctantly to have the trees planted and was unwilling at the time to give more than two acres of his ranch to what he believed would prove a profitless experiment. Without exception these trees have grown rapidly, and for several years have yielded a return of \$100 to \$200 per acre. Last year they seemed as full of nuts as it was possible for them to be and this year there is an even larger yield. It is Mr. Graves' present intention to set 40 acres to almonds. He says these two acres have given him a net return greater than that received from 10 acres of grain.

El Dorado.

A NICE PLACE.—*Placerville Observer*: On the premises of E. A. Boles the first thing encountered was a fine lot of young cherry trees of excellent varieties, and potatoes growing luxuriantly. Green pea vines fully 12 feet long; oats standing thick on the ground, 5½ feet high. A large number of apple trees of the yellow Bellflower and other varieties; plums of the Golden Drop, Damson and Egg; and while there seems to be some complaint of insects in other places, there is not a sign of anything of the kind in Mr. Boles' orchard, which is attributed to his manner of caring for his trees and a proper cultivation. On the southwest side of his residence a narrow valley is covered with timothy and red-top clover as high as a man's shoulder.... He has a lot of young English walnut trees which are growing to perfection. He has pipes laid and hydrants round the entire lot, and water can be taken out wherever desired. There are about 4½ acres of ground in this lot with fine tree water privileges, which belong exclusively to this property. There are several small avenues leading to the residence from different parts of the grounds. Another attractive feature is a large lot of blackberries of the Lawton variety. This place produces each year from 10 to 12 tons of hay, besides large quantities of fruit and vegetables of all kinds.

Fresno.

FRESNO FAIR GROUNDS ASSOCIATION.—*Expositor*, June 20: Their latest move is the building of a pavilion, to be completed in time to receive the exhibits for the 21st District fair. It will be octagonal in shape, 300 feet in circumference, and 70 feet in height. There will be two galleries, each 20 feet broad, 10 feet of which will be at the disposal of exhibitors and the balance for a promenade. There will be two entrances to the building—one solely for exhibitors, and the other, 10 feet in width, for the use of the public. The center space will be reserved for pyramids of fruits, flowers, etc. The contract for the building has been awarded to W. S. Kribbs at a cost of \$4365, to be completed August 16th. There are other improvements going on at the fair grounds, chief of which is the erection of a large building for the accommodation of the teams of the many regular patrons of the fair grounds. This will contain about 30 stalls to be sold at \$25 each. The party buying a stall having the privilege of selling the same, and the purchaser is the owner of the stall so long as the Fair Grounds Association is in existence. Twenty have been sold already.

Los Angeles.

OSTRICH PROFITS.—*L. A. Herald*, June 23: An instance of the profits attached to ostrich farming in Southern California was told by Mr. Cawston, proprietor of the Norwalk farm yesterday. He has on his ranch, with one male bird and two hens, produced, principally by means of incubators, 18 chicks this season. Before they were ten weeks old he sold them to different parties for \$435, some of them going to Arizona where farms are being established, and others being purchased for exhibition purposes. He expects to have similar returns this fall, in addition to which the feathers will realize \$250.

Marin.

ONE STRAWBERRY.—*San Rafael Journal*, June 21: The largest strawberry we have ever seen was grown at B. F. Morse's yard, on Bolinas bay. This monster berry was 5½ inches in circumference and 2½ inches in diameter one way. It weighed 1½ ounces. It was a Perry.

NOVATO OATS.—Last week harvesters were engaged in cutting a field of oats on a portion of the Black Point ranch recently purchased by Mr. D. L. Hayden. The oats stood eight feet high, by actual measurement, and so dense was the growth there was no chance for the grain to lodge. The reaper would not work in such a heavy mass of vegetation, and so it had to be slashed down with a mowing machine, the grain in many places nearly hiding the horses from sight as they moved through it. Geo. Blodgett has done equally well. To Frank Sutton, however, belongs the honor of having raised the tallest oats in Novato, a single stock having attained an altitude of 14 feet.

Monterey.

THE BEET FIELDS.—*Pajaronian*, June 21: Dr. von Wachtel examined the Salinas valley beet-fields last week, and was much pleased with the good showing made.... The work of beet-thinning is pretty well along toward completion, and several gangs of boys have been laid off. They will be needed again next month when the work of picking and cutting the beets is begun. For a time last week it was feared that the warm weather would injure the beet crop, but this week they were much improved in appearance. The season has been very favorable for the beet-growers, and the crop is looking first class. It is hard to tell who has the best looking crop where there is such general excellence.

SALINAS VALLEY GRAIN.—*Salinas Index*, June 21: J. P. Raymond, a prominent local grain dealer, went on a tour of observation last week as far south as Templeton, and speaks in flattering terms of the crop prospects from Salinas southward to Kings City, a large proportion of the grain being barley. Owing to the hot weather in April the yield immediately around King's City will not be large—small compared to what it was two years ago. Across the river, however, on the Posa de los Ositos rancho, there is a splendid crop, the wheat especially being of very fine quality. At San Lucas, ten miles southeast of King City Mr. Raymond says immediately around the town he should think there were 11,000 acres in wheat, all new land, the yield good, and the quality exceptionally fine. In the little valleys tributary to San Lucas, say 8000 acres will have an acreage yield of fine quality. From San Lucas to San Ardo, especially at the latter point, the acreage sown to wheat was small, but quality fine. At Bradley, the yield is good; acreage, double of last year, and quality fine also. At Jolon the acreage in that valley is quite large, the yield good and quality very fine. Passing on to Paso Robles, there will be about 10,000 acres in grain, mostly new land, and of excellent quality, being about double the acreage of last year; the yield is good. Passing on to Templeton, here no grain-raising was ever attempted until within the past two years. He estimates the number of acres of wheat at about 8000. The quality in all the valleys tributary to Templeton is fine. Until the railroad made its appearance very little attention was given to farming.

Napa.

DISTRICT FAIR.—*Napa Register*, June 22: A meeting of the Directors of Agricultural District No. 25 was held in the court-house Saturday. Present, F. W. Loeber of St. Helena, chairman; John Even of Napa, L. W. Buck of Solano, and Joseph Kline of Benicia. Officers for the ensuing year were elected as follows: President, F. W. Loeber; secretary, A. H. Conkling. An executive committee consisting of F. W. Loeber, Ed. Leake and Nathan Coombs was appointed with power to make the premium list and distribute the State appropriation. It was agreed that the District Association and the Napa County Association act together and that the fair here be made the District Fair.

Placer.

OATS.—The *Auburn Herald* has received a sample of the Welcome variety of oats grown on J. M. Fulweiler's place that leaves in the shade all the other specimens of grain brought to that office this year. There are 31 stalks, fully seven feet in height, the product of two kernels, and they bear an abundance of large oats.

San Bernardino.

OLIVES BEARING EARLY.—*Ontario Observer*: The great objection heretofore made to olive culture in this country has been the long period of time required to bring the trees into bearing. From results obtained on Prof. C. H. Dwinelle's five-acre orchard in the northern part of the colony, it would appear that the old objection is groundless. The trees are less than five years old, and are now laden with fruit.

BARLEY AND POTATOES.—*Riverside Press*, June 23: Wm. John, who has a place near the mouth of the Gage tunnel, brought some fine specimens of the Mountain Burbank potatoes to the *Press* office, and on the test cook they proved excellent. Their skins are light, and the meat is pure white and has a fine flavor. The soil on which he raised them is composed of disintegrated granite, containing less desiccated vegetable matter than lower down in the valley. On one and a half acres he planted the seed in February last. The cost was: Plowing and cultivation, \$12; seed, \$8; total, \$20. (This did not include his own time and labor). He irrigated only once and that was in the middle of May. From this acre and a half he will now gather 100 sacks, averaging 120 pounds to the sack, or a total of six tons, or four tons to the acre. He readily retails them

in Riverside at \$1.75 per sack, or a total of \$175, a net profit of \$103 per acre, not counting his own labor.... Mr. John has just harvested 25 tons of barley hay from 23 acres of the same kind of soil, for which he gets \$250. He sowed 70 pounds to the acre, which cost \$1.30 per cwt., or a total of \$20.93 for the field. The planting cost \$1.25 per acre, a total of \$28.75. The harvesting cost the same. To summarize: Seed, \$20.93; plowing and seeding, \$28.75; harvesting, \$28.75; total, \$78.43; total net profit, \$171.57, or \$7.45 per acre. He sowed in January and did not irrigate.

San Diego.

CANNING COMPANY.—*San Diego Union*, June 21: The much talked-of fruit-canning company is now ready for business. Yesterday articles of incorporation were filed with the County Clerk. The name of the corporation is the New York and Linda Rosa Fruit Canning and Preserving Company, and the capital stock is \$200,000 divided into 2000 shares of the value of \$100 each. The purposes of the corporation, as set forth are the raising of fruit and vegetables and canning and preserving the same for sale; the acquiring by purchase or otherwise any patent or other rights affecting said industry; the buying, selling and exchange of lands and other property necessary or desirable for the successful prosecution and development of the business of the corporation; the purchase, manufacture, sale and general dealing with machinery and tools in any way connected with the industry. The principal place of business is designated as Linda Rosa, in this county. The capital stock has all been subscribed by the following gentlemen, constituting the directory of the company: W. C. Jacobs, Linda Rosa, \$196,000; J. E. Dean, Murrieta, \$500; A. G. Chapel, Los Angeles, \$500; James Tobin, Boston, \$2500; H. T. Mason, Murrieta, \$500.

San Joaquin.

JERSEYS FOR JAPAN.—*Stockton Independent*, June 24: K. Sato, a representative of the Japanese Government, and K. Tokashi, a veterinary surgeon, yesterday purchased from H. S. Sargent a thoroughbred Jersey bull and two cows, and from John E. Moore they bought two cows of graded stock. The foreigners are in the State to buy up a herd of fine cattle for shipment to Japan. They bought a drove of Jersey cattle in Marin county and came here to find a pure-blooded bull. The cows cost from \$40 to \$80 a head and the expense of transportation from San Francisco is \$50 a head. The buyers promise to make another call on San Joaquin stockmen next year.

THE CANNING COMPANY.—At a meeting of the board of directors of the cannery company, held yesterday, W. B. West was elected president; C. M. Weber, vice-president; John Herd, Jr., secretary, and the Stockton Savings and Loan Society bank, treasurer. J. M. Turner, who was with the Lusk company nine years, has been employed as superintendent. The subscription books will be opened to-morrow morning at Mr. Herd's office.

Santa Clara.

THE SAN JOSE SOCIETIES.—*Breeder and Sportsman*, June 23: The San Mateo and Santa Clara Agricultural Society, No. 5, has finally come to an agreement with the Santa Clara Valley Association on the following terms: All the outstanding notes of Association No. 5, amounting to \$1850, to be placed in the hands of W. D. Tisdale, President of the First National bank, and to be paid off by the Santa Clara Valley Society out of the money received from the State appropriation, \$900 to be paid this year and \$950 next year, providing the latter society has exclusive control of the fairs.

Solano.

FALLOW CLEANER.—*Dixon Tribune*: E. E. Krause, of Toland's Landing, has invented a machine for cleaning summer-fallowed land. It consists of three rollers in one frame, with sharp spikes, and a knife attached behind the rollers. It crushes the ground in fine shape and cuts all weeds. It cleans a space of 12 feet at one time, and can be operated by six horses, hitched either behind or before the machine. It also has an attachment for cutting tule. The machine has been thoroughly and successfully tested.

Sonoma.

QUAIL ON CHICKS.—*Petaluma Courier*, June 20: Last week a Portuguese farmer living in this township noticed a hen quail, with what he at first supposed were four little quail, running and feeding with his chickens. He noticed, however, that when he approached the old quail she would fly upon or over the barnyard fence, but her four little ones would remain upon the ground. Upon closer examination he discovered that the little ones were really chickens and had been hatched from four hen's eggs laid in the barn. The quail had evidently squatted upon them and driven the hen away after she had laid the four eggs. When the mother quail would cover the four chicks she had to spread herself, and they would sometimes raise her off her feet. After a few days the farmer thoughtlessly took the chicks away from their quail mother and gave them to a hen with other little chickens about the same age. The quail, after mourning a day or two, finding she could not reclaim her little brood, left the place. Why the farmer did not let her keep and raise the four chickens is past our comprehension.

Sutter.

HORTICULTURAL SOCIETY.—*Marysville Appeal*, June 22: The meeting of the Sutter

County Horticultural Society, held in City yesterday, was well attended. The subject of pests was discussed at length, and a committee appointed to confer with the Board of Supervisors in regard to passing an ordinance compelling owners of infested trees to disinfect them. A similar ordinance, adopted in Los Angeles, was read by the secretary. Four new members were added to the roll. The next regular meeting will be held on Wednesday, July 18th.

Tulare.

HONEY.—*Delta*, June 21: M. J. Twining, who lives eight miles south of Hanford, was in Visalia on Tuesday last. He reports that his bees, of which he has 80 stands, are doing well. He contemplates taking a large number of them to the west side, beyond Tulare lake, and believes that he can then have fresh honey during every month in the year. He has the best improved hives, and brought to Visalia several sections, containing honey in the comb, weighing one and a half and two pounds. Three sections were left at this office, and the flavor was pronounced excellent by all who sampled it.

Ventura.

BEANS AND CORN.—*Santa Paula Chronicle*: Between Santa Paula and Satcoy there are thousands of acres of corn and beans looking finely. The long straight rows and clean culture—not a weed to be seen anywhere—are a constant surprise to an Eastern farmer, who has been accustomed to a constant warfare with weeds from the time these crops are above the ground until matured.

Yuba.

MOUNTAIN CHERRIES.—A sample lot of mountain-grown cherries from W. B. Meek of Comptonville, received at the *Appeal* office the other day, were very large and again demonstrate that excellent cherries can be grown at a considerable altitude in the Yuba county foothills.

Yolo.

BIG FIGS.—*Woodland Mail*, June 23: Mr. E. B. Aldrich brought us yesterday from his farm in Capay a box of fine white Smyrna figs, the largest that we have ever seen. One dozen weighed exactly 3½ pounds.

PINS BY THE GIZZARDFUL.—*Yolo Democrat*: Ex-Town Marshall Hoyt vouches for the following: Upon returning home last evening from a drive with his wife, some one of the family had killed a chicken, and his attention was called to what was considered a remarkable freak of nature. The gizzard of the fowl was found to have tin points projecting from it in all directions. Upon cutting the gizzard open it was found to be filled with these instruments, which had literally pinned it together, and when counted 15 were found. Mr. Hoyt lives next to the schoolhouse lot on Main street and thinks the chicken had picked up pins that had been lost by school-children. The chicken was fat and healthy.

ARIZONA.

PEACHES AND APRICOTS.—*Phoenix Herald*, June 14: The admirable orchard of Mr. A. L. Henshaw lies one mile southeast of the city. If it could be seen as it stands to-day with its almost overloaded trees, by all the farmers in the East, South and West, our Immigration Union would henceforth have a sinecure. It consists of 2200 peach and 1800 apricot trees, all heavily laden with ripe fruit, and from their beauty and symmetry as they stand in parallel rows, it is evident that each particular tree was raised a pet. The trees are from four to five years old, and their average bearing was this year from 200 to 400 pounds each, the apricots as large as hens' eggs, while the peaches average as large as one's fist, and the blending of rose and sunset tints on their velvety cheeks makes each one of them a fit model for an artist. Mr. Henshaw has made large shipments from this year's crop to various parts of the Union, distant and near, but the fruit being now too ripe for advantageous shipment, he is gathering and drying the balance.

SAMPLE PRODUCTS FOR AUSTRALIA.—A fine collection of specimens of California-grown grain, pulse and other seeds, intended for the Melbourne Exposition, has been exhibited during the past week at the Produce Exchange in this city. The list of products includes buckwheat; yellow and brown mustard; castor beans; blue Prussian, sweet wrinkled and marrowfat peas; bayo, red, white, pink, Windsor, Lima, pea, butter and Lady Washington beans; white wheat, standard of 1887; Chili club, blue stem, red Australian, Proper, Sonora, amber and White Australian wheat; flaxseed, alfalfa seed, California rye, round white corn, lentils, Mexican corn, popcorn, Egyptian, round yellow, yellow dent and white dent corn; bald, bright feed, dark feed, brewing and Chevalier barley; and Norway feed, milling and surprise oats. Each sample has a little glass-covered box to itself, and they are all mounted in a handsome carved frame. The exhibit is to be shipped to Australia by the next steamer.

HEAVY floods in the cities of Leon and Silao, Mexico, have caused great damage and loss of life. About 2000 houses have been destroyed, and some 1500 people drowned.

THE Southern Pacific Railroad Company has bought \$72,000 worth of land near Tacoma, Washington.

Lost—Found.

To-day, while moving the eight-day clock
That had stood in its corner, tickety-tock,
Ringing the hours from night till morn,
Years and years before you were born—

What do you think we found, to-night,
Buried in dust, quite out of sight,
But the daintiest little baby shoe,
Tied with ribbon of brightest blue;

A baby block, once painted red,
With an O and a P and a lion's head—
Buried treasures, lost for years;
A button, a spool, and a pair of shears!

I know where to find the mate to the shoe,
Tied with ribbon of brightest blue,
With a little curl of yellow hair,
Folded away with tender care.

But where is the baby? Was she lost, too,
With the spool, the block and the little shoe?
Not lost, but found, my darling May,
Just fourteen years ago to-day.

This is she, my fair, sweet girl,
This the baby with yellow curl,
This the hand that lost the shoe,
This the foot that wore it, too.

This is my daughter, fair to see,
Dearer than all the world to me;
Would I could stay the hand of Time
As I stopped the clock, with its ancient chime.

O mothers, whose treasures are hidden away
In a deeper dust than were mine to-day!
They are not lost, but gathered in,
Where dust ne'er soils, where stains no sin!

—Deborah T. Williams in Boston Transcript.

Grandpa's Story.

"So it seems Fred Hayes has finally jilted Fanny Howe," said Grandpa West, one rainy morning, as he stood shaking off the drops from his great coat on our kitchen stove.

"Yes," replied I, as I filled a pan with apples and prepared to cut them, "and more shame to him, too. Brought her clear up to an engagement, and then left town with another girl, and without one word to Fan."

"Shame!" repeated good Grandpa West, with an indignant flash from eyes blue and clear as at 21; "it's a disgrace to any Christian church to let one of its members go on so. Time was when he wouldn't have gone soot free, as he has now."

"But what could have been done?" I inquired.

"Done? He'd have had the full broadside of church discipline on his shoulders 50 years ago. He ought to be dealt with as Harmon Page was," concluded grandpa, meditatively.

"How was that?" inquired I, interested at once.

"I wonder if you ever heard that story!" said he, with a curious glance understood better afterwards. "See here, it's a rainy day, and mother won't be expecting me home. Hand over a knife, and I'll help you with your apples and tell that yarn at the same time."

Well pleased with the plan, I took another pan, and our fingers flew as grandpa went on with the true and authentic history of Harmon Page.

"You see," he began, "all this happened fifty years ago, and Amityville wasn't then the slow-going, dull little place it is now. It was comparatively new, and was as lively and enterprising as the new places of the West are to-day. There were a good many old aristocratic families, though, and I tell you they held their heads high. The very meetin'-house steps had to be gaged accordin' to the rank of the buyer, and I tell you old Deacon Avery would never have got the scowl out of his forehead if Squire Page had happened to had a seat in front of his."

Deacon Avery had a daughter—a quiet, gentle girl, with a slight, graceful figure and a face—well, you don't see such faces nowadays. A clear, fine complexion, with a delicate pink trembling up into her lips when she was spoken to. Her eyes were great limpid wells, changing with every thought, and her hair was a soft chestnut brown, waving about her face in its own wayward style.

"She was a lovely girl, became a professor young, and was always to be seen in the end of the deacon's pew every Sunday, rain or shine. She'd never had much company, for there was a kind of dignified reserve about her that kept the fellows at a distance. But when she was long about 18 or 20, Harmon Page began to go with her."

"He was a handsome, high-spirited chap, lively and full of talk, and as different from Mercy Avery as two persons could well be. But they loved each other; there's no doubt about that. Many's the time I've seen her grand eyes sparkle and pretty cheeks flush at Harmon's witty speeches, till she was really brilliant."

And he, with all his proud spirit, always grow strangely gentle with Mercy.

"So, in spite of the rivalry that had always existed between the two families, no one would have disturbed the two, had it not been for Virginia Wake. She was a cousin of Colonel Ford's first wife, and came there visiting from the South."

"Virginia was called a handsome girl, with her brunette face, flashing black eyes and heavy black curls she was never tired of jingling around her neck. She had a good deal, too, of what you call 'style,' and Amityville folks, who didn't know as much of the ways of the world as they do now, were completely fascinated with her taking ways. The young fellows in particular hovered around her like moths around a candle."

"All except Harmon Page. He had engaged himself to Mercy, and at first gave the newcomer the go-by. The Pages and Fords had a family feud of a good many years standing, which kept them apart for one thing, and Virginia had plenty of company besides Harmon."

"But I suppose Harmon's indifference piqued the girl, and she snubbed the other boys and exerted all her charms on Harmon."

"She came in the fall, and along about Christmas time the neighbors began to notice that Virginia was mighty thick at the Pages."

"The two houses were pretty near together, and she used to run over to Mother Page's on some excuse or other 20 times a day. Perhaps 'twas't strange that Harmon began to be flattered by it. He had as good a turnout as any chap in the place, and he got in the habit of taking Virginia considerable."

"You see position's everything in more cases than one, and Virginia was right there handy, while Mercy lived at the top of one of our old-fashioned Connecticut hills, with a dreadful hard road leading to it."

"Whether she knew how much Harmon was taking the other girl wasn't known; some thought not. She didn't get out much except to meetin' that winter, and she had enough of her father's spunk about her not to let on that she saw Harmon foolin' with Virginia Wake at the noonin's."

"There was splendid sleighing that season—the kind we don't have these days—and some of the young folks wanted to have a general sleigh-ride. It was put off from time to time, till 'twas finally set for one Thursday night."

"It was the night of the regular weekly prayer-meeting, and after the time of the ride was all settled, Harmon, who was the only professor in the party, tried a little to have it changed. But Virginia Wake declared, with a wicked shake of those jingling curls, that she could say her prayers just as well in a sleigh as she could cooped up in that stupid barn of a meeting-house."

"Everybody thought afterwards that she fixed the ride for that night to show Mercy Avery the power she had over Harmon Page."

"Well, the party started from Amityville 'long about five o'clock. They were all in a big two-horse load except Virginia and Harmon."

"She had arranged for them to go ahead in his cutter alone, and I'll admit they were a splendid looking couple, he with his fine eyes and teeth, and she in a rich crimson hood that set off her dark beauty to perfection."

"Our route, for I was one of the party, lay straight up the hill toward Deacon Avery's. Just as we turned into it who should we meet but the deacon and Mercy."

"They were late, for the meeting was all appointed for early candle-lighting; but Mercy had probably waited awhile for Harmon, who for a year back had taken her to Thursday meetin' as regular as the day came round."

"She sat up straight and queenly beside her father as they passed, and seemed not to hear the malicious sally Virginia called out to her."

"We, in the back team, were near enough to catch the scornful glance she threw from those deep eyes, gray as steel that night."

"As for Harmon, he turned white to the lips, and for a mile hardly answered the banter that Virginia kept up. After that he seemed to grow perfectly reckless, laughed and joked louder than any of the rest, and was so careless that he drove on a stone wall; and we, following, were all upset in a heap together, and had hard work to get tied up so as to make our way home toward morning, more dead than alive."

"It was a sorry day for Harmon Page. He was waited upon by a church committee, headed by Deacon Avery, who denounced his whole conduct toward Mercy as unchristian and highly inconsistent in a church member."

"He didn't have much to say for himself, and they churched him on the spot. He was pretty down in the mouth, but kept up some hope till he saw Mercy Avery."

"He had refused to see Virginia Wake, and that night he went up the familiar hill to Deacon Avery's stone house."

"Mercy herself came to the door, calm and self possessed as if nothing had happened, and showed him into the sitting-room. There was a steady light in her gray eyes, though, that made Harmon tremble, and without beating about the bush a bit, he came right to the point and asked if all might be forgiven and forgotten, and they become as good friends as before. He worked himself into a passion, cried, and took on like a child, they said."

"But, law, it didn't move her an atom. She had the genuine old Avery grit, if she was mild mannered, and she told him that, as long as the church had put him out, she, of course, couldn't in conscience take him back."

"He pleaded and entreated until ten o'clock

at night, a late hour in them days, but it didn't make a mite of difference. She wouldn't overlook what the church had considered a gross breach of faith. He went out a crushed man, and from that time his spirit seemed to leave him utterly."

"And what about Virginia Wake?" I interrupted, unconsciously cutting my finger in my eager interest.

"Oh, after that girl had done all the mischief possible, public opinion toward her changed 'mazin' quick, and she left town in a few days, and never was heard from in these parts again."

"And Harmon Page; what became of him?"

"He never got over the shock. He became silent and melancholy, and finally had to be taken to the retreat. He grew worse, and the sight of a handsome woman with red cheeks and black curls would always throw him into his most violent tantrums. He died in the asylum at last."

"Now I think that was real mean," said I, wrathfully, winding cotton around my bleeding thumb. "If Mercy Avery hadn't turned him off his life might not have ended so sadly. I think she ought to have taken him back."

"Ah, ha," said Grandpa West, quizzically; "do you mean that?"

"Certainly," said I, with dignity, "why shouldn't I?"

"Oh, nothing," he replied; "only if she had, Harmon Page would have been your grandfather instead of me."

"My grandfather—why, then," said I, in some confusion, "Mercy Avery must be—"

"Mercy West, your grandmother," said grandpa, chuckling me under the chin. "Confess now that 'all's well that ends well.'"

"I suppose so," said I reluctantly. —*New England Magazine.*

The First Cloud.

[Written for the RURAL PRESS BY D. ROTHY SHIRLEY.]

It was the second anniversary of our wedding-day, and my baby Bertie had just begun to notice.

I was very happy, for I loved my husband, and not a cloud had marred the sweet sunshine of those first years of married life. My father and mother were spending the day with me, and we had such a happy time together. Baby Bert was on his best behavior, and all agreed that another such baby was never seen.

I was doing my own work, and either from excitement or the heat had a fainting spell while preparing to get supper. They were all so startled and worried, for I had seemed quite strong. Ned carried me to the lounge and mother finished getting supper. I went to the table and drank a cup of tea, while they all watched me with loving, anxious eyes. Soon afterwards they persuaded me to take baby and go to bed.

As there seemed to be no danger of a recurrence, Ned went down town on business. Father and mother had promised to stay till the next day, so as the evening wore on and he had not come, they went to bed, leaving the door unlatched for him.

He was often obliged to be away from home, and his business often kept him down town till late; so I sunk into an easy sleep from which I did not waken till near morning. Great was my surprise to find he had not returned.

He was so often away at night that I did not worry as under other circumstances I should have done; still, of course, I was curious as to the cause of his not returning, for it had always before been possible to send me word if he could not get home when expected.

The hours dragged away, and at last, as we were eating breakfast, he walked in. I had to leave the room to go to baby just as he came, so did not hear what he said to the rest.

When I came back I sat quietly down at the table and asked him if he had his breakfast. He answered cheerily enough that I might give him a cup of coffee.

The rest of the day was like any other, save that I kept out of his way as much as possible. Why? Well, anxious as I was to have him tell me all about it, a preverse spirit in me made me reluctant to give him a chance to talk to me alone.

Then I kept thinking about it and making the matter seem worse, as I turned it over in my mind, viewing it as I thought on all sides.

I thought of all the different reasons that had at various times made it necessary for him to be away over night, but none of them seemed to fit this especial time.

If he had to go a little ways out of town on business, he often came home in the "wee sma" hours of the morning rather than be away altogether.

So the more I thought of it the more I resented this apparent indifference to what might be my opinion. I brooded over it all day, angry that I was so ignored, half frightened and wholly grieved, for I could but think of—

"The little rift within the lute,
That by and by will make the music mute,
And slowly widening
Silence all."

However, I succeeded in keeping a calm exterior, until Ned said to me with a caressing hand on my head:

"How does my little woman feel to-night?"

We had gone to our room for the night, and I burst into tears. He drew me to him, with a tender concern in his face, and I whispered:

"O, Ned, I've felt so cross with you all day."

"Why?" he asked. And I answered without raising my head:

"Because you didn't come to me and tell me why you didn't come home last night."

"Ah!" he said, "I thought that was it. Well, I'd rather not tell you, but—"

I started away from him and exclaimed:

"What on earth do you mean?"

As he looked at me in some astonishment, I drew myself out of his caressing arms and ran out of the room.

I cannot well tell you how I felt. I was in a mental whirlwind of hurt surprise, indignation and doubt.

When I finally went back in the room he was lying with baby nestled up close to him.

He attempted to speak to me, but I put my fingers in my ears, and said stubbornly:

"I will not listen to you; if you had rather not tell me, you shall not."

A half-amused half-pained look passed over his face. He shrugged his shoulders and closed his eyes as if sleepy. In truth, I must have looked foolish enough, standing there with my fingers in my ears, lest he should tell me what with all my heart I was longing to hear.

He only spoke to me once again that night, and then said:

"In the morning we'll talk this over, and then I'll tell you what I think of such matters between husband and wife."

I only said coldly: "Of course you can do as you please, but I had rather you would never refer to it again."

This when I knew I shouldn't sleep all night for wondering what could be the reason he had rather not tell me, his "other self," as he had often called me. I fell into a troubled sleep toward morning and awakened late. I was hurried by my work all day and Ned was obliged to go away for a week. We parted with no attempt on my part to arrive at an understanding.

How long the days seemed till he got back! I had plenty of time to regret my refusal to listen, and made up my mind to tell Ned so when he was home again with me. Not that I meant to let him tell me about that night. No! No! I wanted to show him I was willing to trust him.

The first chance we had for a quiet talk was devoted to that topic. He began it himself, and I asked him if he had wished not to tell me because he thought I lacked trust in him.

"No, little one, I realized your right and your natural interest to know of my movements," he said, "and I had no thought of not telling you. I only wished, for the sake of the friend whose interests I had been guarding, that I had not needed to make his trouble known."

I only looked puzzled, for you see I had never thought of that as a possible reason.

"Yes," he continued, laughing at the expression on my face, "I stayed away on another's account, not through any carelessness or wish of my own. One of my most intimate friends, a young man whose only fault is his fiery temper, got into trouble and needed some one to help him out of it. I stood by him and prevented any disgrace; managed it so it need not reach his parents' ears till he himself told them, and it kept me too late to reach home in reasonable season, so I stayed all night at his home. He felt badly about the scrape, and of course wanted it kept quiet, but I should have told you, little wife, only you wouldn't—"

"I know, I know," I cried, throwing my arms about his neck. "I was foolish and unreasonable, but I've been well punished, for I've been so unhappy ever since. You have been very patient with me, Ned," and I pulled his head down for a kiss, feeling rather ashamed of myself.

"Well," he said, gently, "I had no right to be angry or impatient, for you had cause to be grieved; but don't fancy that I didn't mean to tell you, for I did, and will even now."

"No!" I exclaimed, stopping his mouth with a kiss, and to this day I haven't let him tell me what the trouble was that night, nor who was his friend. However, I think I could guess his name.

The New "World-Builders."

[Written for RURAL PRESS BY MAID-OF-ALL-WORK.]

Probably our most distinct and clear-cut picture of the early mining days in the California hills is that delightful novel of Joaquin Miller's, "One of the World-Builders," which was stolen bodily and dramatized on the stage as "49." "49" was the central figure, and a personality with which most people who have ever lived in the mining regions are more or less familiar. There were "49's" in or near every town of the gold regions. The successful ones, like Joaquin Miller's "49," appeared in the cities below or went East as capitalists, but the unsuccessful ones remained prospecting for rich strikes, and some of them, hidden away among the canyons and forests of the great mountains are there still, unable to break away from the old haunts.

"49," the old "World-Builder," had a tunnel and little else, and half-starved on "corn" and hope, while he picked and drilled his slow way toward the mountain's heart. Everything he had went into that tunnel, and the people said his reason had gone, too. At last, old and gray and worn, with starvation looking over his shoulder, he drove his pick into the great vein, and the world, the mining world there, was built up in a day into great prominence.

He had original thought, clung to it and had

faith in it, and in that sense he was also a world builder; and his title may be brought down the stream of time, and I may give it again to the heroes of the new era that has now come to the pine-scented flats and vales of the foothill regions.

Fruit planting in California has fought its way all along the line until quite recently. It is no wonder that doubt was strong when the settlers began to creep down the great central plains and built lonely looking homes, without the shadow of a single tree to break the monotony; but in the foothills, the natural home of the tree and vine, the backwardness of the industry is unaccountable.

It took many years after the railroad was built to find out that fruit could be shipped, and now, after all this delay, about two thirds of the hill country must be cleared, old ditches renewed, new ones dug, trees planted, and three or four years must elapse before the increase comes.

It is one of the failings of the human mind to have no faith in anything that grows till the proof stares us out of countenance. In certain localities on the plains where the grain crop seldom or ever fails under the new system of agriculture, they have a panic nearly every year in April when the lower leaves of the plant die and the upper leaves straighten up around the forming head. If a few hot days come at that time the fields look sickly and blighted, everybody looks sad and the "boys" strap their blankets and prepare to emigrate. But suddenly a cool wind springs up, the breath of the sea fog permeates the air, the fields revive, and, presto change, every one smiles.

In the growth of a tree there are several years in which panics can strike the owner who has risked his time and money, so that it requires not a little character of the fine heroic quality to start out on an enterprise in which, though Paul may plant and Appolo may water, yet only God giveth the increase. The little helpless tree with its roots tied up in a sack has no way of telling just what it wishes in the way of soil and care, and experiment is slow and expensive, so that the brave horticulturist has to whistle cheerfully over a great many things he don't know all about, while the panic-maker leans over the fence and sows his seed of fear and discord.

Many people who believe in God and his immutable laws, can't believe the laws of Nature and their own reason about anything that grows till a neighbor has tried the experiment at his own risk.

For this reason progress in horticulture is slow, and for the same reason State experimental stations will relieve beginners of a great burden of care, and accelerate in a remarkable degree the development of the State.

Meanwhile the new world-builders push forward with their silent and heroic work. It takes faith of the stalwart kind to begin on a rocky hill slope covered with brush and forest expecting to change it into a neat, tasteful, orderly home spot surrounded with a successful orchard, dropping its beautiful increase into the shipping boxes. It is a long strong pull from the first sound of the ax to the nailing up of the full, fragrant boxes.

But it is the genius of the world-builder that toils and struggles and waits. The heroic world-builder of the hills finds many ways to ward off the pinching hand of hard times, while his cottage, surrounded by vines and trees, and beloved of the Goddess Flora, grows in comfort and beauty. And it seems to me that those who demonstrate what despised brushy hills are good for and show to the home-hungry from everywhere what fair bright homes can be made among the rocks and glens, are the true world-builders of the age.

He is gratuitously told by the panic-makers over and over, that the soil is too thin for his trees, that it is too cold for his citrus fruits, and too hot for his vegetables; that the market will overstock; that the age will harass him, the scale bug overcome him, and all the miseries of life overtake him, because he has chosen horticulture for his occupation. But the brave world-builder is dumb as Excelsior, and calmly goes on setting strawberries between the rows and raspberries in the wet corners, and raises vegetables, and finds his market among old Californians who have been for many years practicing the strange economy of going without vegetables and paying doctor's bills.

He turns every way to meet expenses while he waits. He sells the wood from the clearing, handles the carpenter's tools and becomes a jack-of-all-trades in the neighborhood. His wife and children work in the garden and make play of it in the soft April and May weather. They seem never so happy as when weeding and picking berries, and the little ones are as proud of the clean garden rows as the little city misses learning their first graces at the dancing school, and are more justly happy because they are learning the laws of plant life and acquiring wisdom that will never forsake them.

It seems like the making of a new world indeed to drive up from the wide yellow plains and see the forests primeval giving way to the clearings and those hardly yet intruding on the forest altitudes that stretch upward to the Sierras. The old mining ditches, whose mission once was to cut yawning holes in the hills and carry the debris down over the home of Ceres in the valley below, now wind peacefully among the hills giving out its bright waters to spread the slopes with smiling orchards and the flats with

green gardens, so that the world of tailings and tunnels, of shafts and bare rocky desolation, is changed into a world where trees, gardens, building sites, views, lawns and avenues are the first considerations.

What has an hour brought forth when the housewife plants tender vines and flowers around the old rocks that held the hillside against the hydraulic pipe in the brave days of old! The first cottage of the new world-builder is but little larger perhaps than the cabin of '49, but the wife is there with the comfort her presence implies, flowers shine gayly about, and the garden rows surround it like a frame. Each year adds grace and utility—a room here, a porch there, one window more, and the ideal home approaches. Tree planting is like an education; it is never too late to learn, and the most determination and the best thought precedes the best results. The new world-builder must be a lover of his calling, and among the multitudes flocking to our State there will be enough who will be charmed by the healthful, picturesque placer regions to make the days of '89 a wonderful triumph of the days of '49, and a triumph that will be as enduring as the love of beauty and comfort in the human beast.

YOUNG FOLKS' COLUMN.

How Bessie Crossed the Ocean,

With Some Account of What She Saw on the Way.

[Written for the RURAL PRESS by MARTHA T. TYLER.]

In a cottage where the roses
Have it all their way,
Lives the darlingest of neighbors—
Dimpled Bessie Gray.

Frank is Bessie's sturdy brother—
Thinks he's dreadful wise;
Has the saniciest of noses,
Shiniest of eyes.

When she calls the moon a lantern,
(She is under six)
He with gravity of seven,
Answers "Fiddlesticks!"

When she calls the bay an ocean,
You should hear him laugh!
"Silly Sis," he says, "it isn't
Big enough by half."

"Bess," said I one morning, smiling,
"Let us take a trip
All the way across the ocean
In the ferry ship!"

So we got aboard the "Newark,"
I took care of doll;
Much as Bess could do to manage
Tiny parosol.

Far and wide the wind was blowing,
Waves all capped with white;
Over them her brown eyes wandered
Dreamy with delight.

"Say, you know, I think it must be
Mermaid's washing day;
Cause the water's full of soap suds,"
Whispered Bessie Gray.

Soon she spied the distant hilltop
Shaped so like a face;
Little fleecy clouds around it
Gathered for a race.

Swiftly by the purple mountain
Bessie watched them sweep;
"That's Boy Blue," I heard her murmur,
"With his cows and sheep."

After this we saw the city
Looming thro' the smoke;
Gradually the cumbrous ferry
Steamed into the dock.

"Come my pet, here's San Francisco,"
"I was 'bout to guess
Maybe 'tis the giants' kitchen,"
Answered little Bess.

Alameda, June 19, 1888.

The Pleasure of Helping Mother.

[Written for the RURAL PRESS by M. L. R.]

Tears ago when I was a little girl, I was asked by a schoolmate if I helped my mamma any. "Why no, we keep a girl. I do not have to work," exclaimed I, proudly. "So do we," said she, "but I dearly love to help mamma do little things. I know how to wash the china, dust the rooms, dress myself, and lots of other things." Why I dress myself and help Tervy dress, thought I during the afternoon; but, child-like, I thought that was not washing the delicate cups and saucers, so I devoted my spare time to thinking. "Oh my! If I only could just once, all by myself, wouldn't it be splendid?"

I don't suppose she does it all by herself either. I would be ahead of her too. You see I was the least bit jealous of my friends accomplishments, so was more anxious to do and try than I otherwise would have been. But my chance came sooner than I expected. The next morning Biddy left without warning. Papa was mad and grumbled at "such a house." Ted was, if anything, meaner than usual. Tervy was peevish and cross, fires wouldn't burn, "little mamma" was about ready to cry. Now is my time, thought I, so I said: "Mamma, if you will let me I'll stay home from school to-day and help you."

She smiled at me through the swimming tears; stooping she gently kissed me, whispering low

"my little daughter." That was all, but it was enough. While the family was at breakfast I slipped into the hall and put papa's hat, gloves, cane and umbrella on a table near the door, then placed everything that Ted would want in one room; opening the windows and turning his bed to air while upstairs.

Not thinking of anything else to do, I returned to breakfast. As I took my chair, Ted said: "What makes Topsy's face so red, ma?" Ah, did I not know, was I not helping the dearest of mamma's? As they used to say "It never rains but it pours," so it was with us; for about nine o'clock mamma fell and sprained her ankle. With my help she limped to a chair, while Tervy ran to the door, called the first boy she seen, commanding him to "hurry and get a doctor, her mudder was killed."

It happened to be a neighbor boy so the doctor was soon with us. Imagine mamma's surprise when the doctor said she must not walk on that foot for six days.

There was the mornings work to be done, cooking to do, children to take care of, and no girl; "O dear, O dear." "We've got to mind little mudder, us tan do de worst," said Tervy. "That's right," declared the doctor taking his leave, promising to bring Tervy a hat full of candy if she would see that mamma minded him.

Ah, with what pleasure I washed the precious china that day, cleaning the silver and arranging it on the sideboard to my own satisfaction. How I cleaned the kitchen as mamma told me, slipping back half an hour after to give the range another touch, and for the fourth time setting the chairs; with what pride the sweep ing, dusting and making of mamma's bed was gone through with. How deftly the duster flew here and there, now over the cut-glass bottles, now the pink satin pin cushion with its bunch of pansies painted in one corner, then quickly over the mirror with a decided flourish at the chairs and sofa.

Then, with a tired little sigh I hung up my broom and duster. Tervy hearing me, I cried out: "Topsy, we's don nicer." How swiftly time passed talking with mamma in the cheerful, flower scented little parlor until lunch time.

The fairies must have waved their wands over that lunch. Was there ever one before or since half so good. No matter if the toast was cut unevenly and browned too much. Wasn't there a pure white lily (mamma's gift toward lunch) so heavily laden with perfumed nectar "fit for the gods," that it bowed its waxy petals to the board? What if the tea was boiled black, wasn't there luscious glittering bright red fruit to be eaten with pure cream? And above all, wasn't there the dear little mamma smiling sweetly at it all? CLIPPER MILLS.

GOOD HEALTH.

Animals as Doctors.

Animals get rid of their parasites by using dust, mud, clay, etc. Those suffering from fever restrict their diet, keep quiet, seek dark, airy places, drink water, and sometimes plunge into it. When a dog has lost its appetite it eats that species of grass known as dog's grass, which acts as an emetic and purgative. Cats also eat grass. Sheep and cows when ill seek out certain herbs. An animal suffering from chronic rheumatism always keeps, as far as possible, in the sun. The warring ants have regularly organized ambulances.

Latreille cut the antennæ of the ant and other ants came and covered the wounded part with a transparent fluid secreted in their mouths. If a chimpanzee is wounded it stops the bleeding by placing its hand on the wound or dressing with leaves and grass. When an animal has a wounded leg or arm hanging on, it completes the amputation by means of its teeth. A dog on being stung on the muzzle by a viper was observed to plunge its head repeatedly for several days into running water. This animal eventually recovered. A terrier hurt its right eye. It remained under a counter, avoiding light and heat, although it habitually kept close to the fire. It adopted a general treatment—rest and abstinence from food. The local treatment consisted in licking the upper surface of the paw, which it applied to the wounded eye, again licking the paw when it became dry.

Animals suffering from traumatic fever treat themselves by the continued application of cold water, which M. Delaunay considers to be more certain than any of the other methods. In view of these interesting facts, we are, he thinks, forced to admit that hygiene and therapeutics, as proposed by animals, may, in the interest of psychology, be studied with advantage.

Many physicians have been keen observers of animals, their diseases and the methods adopted by them in their instinct to cure themselves, and have availed of the knowledge so brought under their observation in their practice.—*New Orleans Picayune.*

TO RELIEVE HEART TROUBLE.—Mrs. E. L. Mayberry writes to the Los Angeles Times as follows: I suppose one would be laughed to scorn should they suggest to the learned physicians engaged in torturing the last days of brave Gen. Sheridan, that a common rubber bag filled with hot water, placed over the re-

gion of the heart at night, is more effective than cases of heart failure of any kind than torturing methods usually resorted to combined. I have suffered from heart trouble for the last ten years or longer, and have never failed in restoring it to its normal condition very quickly by this method, even when my limbs have become cold and purple. Although I cannot benefit brave "Little Phil" by this information, it may aid some other unfortunate who is being punctured, morphined and blistered into the grave or worse, if you will make it known.

THE "CIGARETTE EYE."—A New York oculist says that the greatest enemy to the eyes of young men is the cigarette. Recently a disease has appeared among smokers, which is dangerous, and after careful investigation, the best authorities, who, for a long time, were at a loss to understand the peculiar malady, have traced it to the small, paper-covered tobacco sticks. It is now known as the "cigarette eye," and can be cured only by long treatment. Its symptoms are dimness and film-like gathering over the eye, which appears and disappears at intervals.

COCAINE not only destroys the will-power, but will make a villain out of the honestest man in the world if indulged in to any great extent.

DOMESTIC ECONOMY.

Whitewashes.

A reader who has half a mile of fence and barns to whitewash asks us to give a recipe for a whitewash that will be durable. In answer to a similar request about two years ago we gave the following:

There are several methods of making serviceable wash. One is made as follows: Three pecks of water lime, one peck of silver sand, and a half a peck of salt. This is used for old, rough fences and outbuildings. The common whitewash is made by putting quicklime into a tight barrel, pouring on water to slake it, and adding water till it is of the consistency of cream. This is used for ordinary work. But a much better whitewash, which stands weather well, is made as follows:

Put half a bushel of quicklime in a barrel and add boiling water until it is covered nearly six inches deep; cover the barrel to keep the steam in, and when the violent ebullition is over, add water enough to bring it to the consistency of cream, allowing four pounds of rice flour to each half bushel of lime, or the rice flour may be mixed with the water for slaking, mixing the flour carefully in cold water before putting it in the hot water. Stir constantly in the hot water until thoroughly set, and then pour it all over the lime, as directed.

To improve the above, add two pounds of sulphate of zinc and one pound of salt. To change the color, add yellow ochre for cream tints, raw umber and lampblack for gray tints, and umber, red and lampblack for fawn tints. The permanence of whitewash, thus prepared, is remarkable, and, when once tried, will be used to the exclusion of the ordinary mixture. While on this subject we will add directions for making a wash

For Poultry Houses,

Which we found in an exchange a few days since: "Take one peck of burned stone lime and slack it with boiling water. Do not use more water than is necessary to have the lime slowly crumble, and use a tight barrel for the purpose. When it is fine, pour enough boiling water over it to make a thick mass. Now add one quart of kerosene to a gallon of skim milk, mix well and pour the mixture in the barrel. Next put a pound of carbolate of lime in the barrel. Stir the whole well and add sufficient hot or cold water to give it the proper consistency. Apply it once a month, and it will not only protect against vermin, but it will be durable and give neatness to the poultry house.

ANGEL CAKE.—The whites of 11 eggs, 1½ cupsful of powdered sugar, one cupful of flour, one teaspoonful of cream of tartar. Sift the flour four times. Beat the whites of the eggs to a stiff froth, add the sugar gradually, then the flour and cream of tartar. Bake in a pan with a tube in the center.

POTTED SHANK.—Boil a shank of beef till tender; chop the meat and season with salt, pepper, and (if liked) half a nutmeg. Reduce the liquor to three parts, add the meat, cool in a mold. It should turn out well when cold.

CHOCOLATE PUDDING.—Heat a quart of milk to near the boiling point. Thicken with dissolved cornstarch, and sweeten. Stir in half a tea-spoon of grated chocolate. Flavor with vanilla and serve with cream when cold.

WHITE CAKE.—Two cups of sugar, two cups of flour, one cup of cornstarch, one cup of butter, whites of five eggs, one teaspoonful of cream tartar and one-fourth of a teaspoonful of soda.

WHITE CAKE.—One egg, one cup of sugar, one cup of sweet milk, one-third of a cup of butter, two cups of flour, two heaping tea-spoonfuls of baking powder.

SUGAR COOKIES.—Two eggs, a little more than one-half cup of butter, one cup of sugar, one-half teaspoonful of soda (scant) in four tablespoonfuls of water.

The Week.

The strange weather seems to have worn itself out, and the old style of California summer, bright and warm and dry, has reasserted itself. Sun-drying of apricots in the earlier regions is therefore proceeding under clear skies, and a very fine article is being produced. Shipping of fruit Eastward is progressing at a rapid rate, and auction reports are on the whole favorable, though there is far too much delay on the part of the railways in the delivery of goods at Eastern points. Overland lines have much to learn in this matter.

We have just read that fruit-trains on the Illinois roads have the right of way, and even a special with the President of the United States on board would have to take a side track while the gooseberries flew by to market. That is just the rule that should be stretched across the continent.

The greatest event of the week has been the completion of the work of the Republican Convention and the nomination of Benjamin Harrison of Indiana and Levi P. Morton of New York as candidates upon a thorough protection platform. Now the music will begin. There are now three tickets in the field: Democratic, Cleveland and Thurman; Prohibition, Fiske and Brooks; Republican, Harrison and Morton—and plenty of time for more. The campaign promises to be warm and interesting.

Close of the Volume.

The last issue of June brings us to the close of another half-year volume and XXXV will go upon the shelf. It has been a volume full of practical information about our industries, our resources, our home life and aspiration, as the carefully prepared index upon the last page of this issue will certify.

Each new half year brings forward a wealth of information about the progress of our grand State and coast, and yet each succeeding period surpasses it in achievement and in the promise it discloses.

We have the experience of 17½ years in this work to warrant us in assuring our readers that the coming volume will be better than those which have preceded it, and upon the effort to secure this result we enter with full zeal and confidence, encouraged by our constantly growing circle of patrons and friends and incited by the growing cause in which we are laboring.

The Spirit of the Day.

It is one of the noblest endowments of our nature that while standing on this point of the fleeting present, we can look both ways. By memory and history we may in some degree recall the past, and by hope and imagination anticipate the future. Only so far as we can listen to the words and contemplate the actions of the good and great who have gone before, look at the world as they saw it, feel the thrill of ideas then in the air, shall we be able to realize the heroism of their lives and prize the work they have given us as a heritage.

The sentiment that gives meaning and fragrance to Independence Day is more than an attachment to the land of one's birth. Men cling to their native soil however cold and bleak it may be. The Iclander would grow homesick in our citrus belts and sigh for the frosts and auroral lights of his wintry home. But this feeling is not patriotism. It possesses no moral significance above the feeling shared by the Digger Indian. The patriotism that fired the soul of Franklin, Hancock and Washington, the power that won our liberty, was a moral force. This was the spirit that caused the elder Adams to exclaim as he heard the reports of the musketry at Concord and Lexington: "Oh, what a glorious morning is this!"—Warren to say, "Put me where the battle is hottest!" Putnam to shout out at Bunker Hill, "Powder! powder! Ye gods, give us powder!" And the New Jersey dominie, when the army was destitute of wadding, to rush to his little rural church and get a copy of Watt's psalms and shout out: "There, boys, put Watts into them!" The continental army was composed of farmers and artisans poorly armed and poorly clad. Baron Steuben said the only regularity he saw in it was that the short men were put in front and the tall men behind. Old Putnam gave him this explanation, that the Americans didn't care about their heads; all they cared for was their legs. Shelter their legs and they would fight forever. Baron Steuben attempted to organize them, lost his temper and swore at them in three languages at once. But those were the men who carried our new-made flag over many a bloody field till victory perched upon it at Yorktown.

They were inspired by an idea. It was patriotism, the love of liberty, the political idea embalmed in the Declaration of Independence, which finally crystallized into this glorious galaxy of States. Perhaps the most grateful contribution we can make to this day is to bathe our hearts afresh in this idea.

DESIRABLE IMMIGRANTS.—Word has just come from the agent of the Swedish Colonization Society that several families are soon to start from Illinois for California. After careful consideration, the agent has decided to settle a large proportion of the newcomers on the lands of the Miramonte colony in Kern county. The abundant supply of water, which is so easily obtained there by means of artesian wells, had much to do with his decision in favor of that locality.

THE SILK-WORMS at the rooms of the State Board have done spinning their cocoons, and the work of feeding is over for the season. Reeling will now go on until the time comes around for hatching the next batch of eggs.

THE proposition to annex Rattlesnake Island to the city of San Pedro was voted down.

Business Depressions.

More often than otherwise business depressions are merely the result of our imaginations; just as people often imagine themselves sick, when, in truth, they have no ailment at all. It is quite common to hear the expression—"Trade is dull," with perhaps the addition, "much more so than a year ago at this time." When any considerable number of people are impressed with such an idea, and are constantly giving voice to it, it will be so. Business will be dull because those who unconsciously work to that end make it so.

The disposition of the American people is to activity, to quick trading, to rapid progress in the developments of trade and industry. They would like a continuous boom. They are never satisfied with steady, legitimate trade. Money must be made rapidly; fortunes must be accumulated quickly. Some are thus in a hurry to the end that a period of rest and repose may be secured; but perhaps the majority continue the active pursuits of business for the mere love of excitement which it brings. The latter is more apt to be the case with the very wealthy—with the many millionaires. Our heavy millionaires do not continue in business merely for the love of money, or for what it will bring them so much as for the pleasure and excitement of getting it.

But to return; if people instead of saying "trade is dull" should on all sides agree in the remark that business is good, as good or better than it was a year ago, so it will be. Of course there are some times causes for genuine depressions in business; but as a general thing, such depressions are greatly intensified by the unconscious acts of the masses who are constantly complaining and imagining conditions which do not exist, just as many make themselves sick through the imagination. There is probably no part of the world where these things are more observable and real than in California.

If a man is out of business and has a little spare cash, the question is generally "What shall I do?" In this state he is quite too often down to the stock exchange, or allured by the seduction of corner lot speculations. Don't do either. If you have a little money and don't see just how you can get into any better business, get yourself a small piece of land that you know you can handle, set out fruit trees, sow a small patch of alfalfa to feed a cow or horse or both, if you can make a profitable use of them. Plant a few vegetables for yourself and family. Raise a few chickens as broilers and for eggs. You can always sell the surplus over and above your own wants. In the meantime, while your fruit trees are growing, improve as best you can the ground between them. It will neither impoverish the trees nor prevent their growing. By such a course you will soon place yourself beyond want, and you will be able to add from time to time to your possessions, until you are quite independent. Of people who will do this the country will never have enough.

If all our people who are out of business would pursue this or some similar course of life and cease repining over the lack and dullness of work, we should have fewer "depressions of business," less poverty and want, and a universal and continuous reign of prosperity and happiness.

BOGUS OLIVE OIL.—An interesting feature of the meeting of the State Board of Horticulture will be the report which the secretary, B. M. Lelong, will make of the tests which he has made of what is bottled and sold by grocers of this city as olive oil. Out of five brands purchased, and some of them purporting to be California olive oil from some non-existent and imaginary olive orchards, not a single bottle of pure olive oil was found. This report on olive oil and the essays on crystallizing fruits should make the meeting of the board, at 220 Sutter street, on Monday, July 2d, worthy the attendance of horticulturists.

FIRST CANTALOUPE.—Two consignments of cantaloupes, first of the season, were received June 22d by Allison, Gray & Co. and A. Lusk & Co. Both shipments came from Winters, being grown on the ranches respectively of H. B. Porter and L. Morris. The fruit was quite small, though ripe, selling at \$3 and \$5 per dozen. The Placer Republican notes the arrival of cantaloupes to Newcastle June 16th.

British Investments in America.

The frequent announcements in English and American journals of British companies organized for carrying on the various industries in this country has become a topic of much thought and speculation. There are two classes of organizations of this character—the one merely furnishes the capital and transfers all the profits thereof to England; the other is a bonafide investment of both capital and profits in this country. The first is a leech upon our people, and should not be encouraged. True, it furnishes employment for labor and adds somewhat to our population, but the business is generally of that character which employs the largest amount of capital and the least amount of labor.

The most noted of this class of investments, and the one most pernicious to our interests, is that of cattle-raising. A firm in Scotland has furnished statistics which show that the British capital invested in cattle companies in this country exceeds \$20,000,000. The statistics referred to enumerate eleven companies who own in the aggregate nearly 700,000 head of cattle and occupy 3,319,000 acres of land. The first organized of these companies, which was started in Edinburgh, declared dividends for the first few years of about 20 per cent on its investment. This success quickly led to the organization of ten other companies, which are enumerated. The heavy profits that were realized at first led to such close competition that little or nothing has been made by these companies during the two years last passed. The London *Financial News* speaks of the present condition of these companies as follows:

The English investors in American ranch companies, who are at present quarreling with their directors or their managers in this country [England], and are attributing their diminished dividends to mismanagement, will do well to study the report of the International Range Association. This organization was the outcome of the convention of cattle owners recently held in Denver. It declares that such a producers' combination as this is ominous of trouble ahead, even for a "ring" so immensely powerful as that which owes its existence to the so-called "butcher kings" of Chicago. All roads lead to Rome, and it is becoming exceedingly difficult for the Western producer, whether of cattle or corn, to clear his produce for the Eastern seaboard without leaving his entire profit in the hands of one section or another of the Chicago middlemen. It is notorious that these gentlemen have obtained such freight concessions from the trunk line railroads between Chicago and all Eastern points that they have secured the complete monopoly of the Western meat trade. In addition to this, the Western farmers and ranchmen in these depressed times have become largely indebted to Western banks, and these banks are in turn controlled by the great wealth of the Chicago kings. But the countermeasures thrown out by the Convention at Denver, which promises to combine and control all the local stock associations from the Gulf of Mexico to Puget Sound, may well commend the consideration of this, the greatest ring America has ever known.

So it appears that the railroads are getting the chief portion of the profits of the British cattle companies. It also appears that these foreign investments have served the useful purpose of lessening the price of beef in this country, and such being the case no one here is disposed to find much fault. At the same time the occupancy of such an enormous area of lands by these capitalists is a constant source of irritation and adverse criticism on the part of our people; but if they don't make any more money for the next year than they did last, they may be willing to sell out cheap, for there is such a thing in this country as a man or a company becoming "land poor."

The kind of capital which is most beneficial to our people, however, is that which is seeking investment in the manufacturing and producing interests in the Eastern and Southern States. A large number of plants in the silk, wool, cotton, and iron business have recently been either removed to this country from England, or established here as new enterprises. As a general thing the owners of these enterprises accompany them and bring large numbers of their own workmen to run them. Such investments add to the permanent and material wealth and population of the country, and should be, in every proper way encouraged. Uncle Sam can, and is ready to take them all in and do for them as he would for his own native-born children.

THE Bear and Crow Indians, in the Yukon river region, Alaska, are at war.

Effects of Dehorning upon the Animal System.

Bulletin No. 1 of the Tennessee Experiment Station contains a description by Prof. C. S. Plumb of a series of dehornings, which were practiced on the animals at the station with the object of determining the condition of the horn and the wound, the presence or lack of suffering, the after condition of the animal, and, so far as possible, the general effects of dehorning on the animal system. We are indebted to the officers of the station for the privilege of reproducing the sectional drawings of the horns which were removed, and we shall accompany them by a compilation from the descriptive matter of the bulletin, which will, we trust, enable our readers to understand the nature of dehorning better than they have been able hitherto.

In all there were four animals operated upon. They were strong, healthy animals, ranging in weight from 1000 to 1200 pounds. All of them had horns of good size, at the base covered with more or less flesh. The following are the notes of the operations:

Steer No. 1—Bled slightly, and did not bellow. Were 20 minutes doing the entire operation, from time of taking from barn to return. Animal was unruly.

Steer No. 2—Bellowed some, and bled to a medium extent. Complete operation lasted 18 minutes. Animal unruly.

Steer No. 3—This animal bled badly, and bellowed loudly, as though in severe pain or fright.

Steer No. 4—Did not bleed very badly nor bellow. The entire operation, from first to last, occupied 10 minutes.

The operation was observed by a veterinary surgeon who made careful note of the action of the pulse before, during and after the operation. The animals were also weighed from time to time to note effect upon live weight, etc. The bulletin shows that there was a very decided increase in temperature and pulse beat, even after four days. The most striking case occurred with steer No. 3, who bled the most severely of all, and who evidently suffered the greatest pain of any of the four. The increase of temperature, though slightest, is noticeable. In the matter of weight, No. 1 fell off three pounds the day after the operation, but the next day resumed his weight of the second day, and from then made a continual gain to the end of the month. No. 2 neither gained nor lost in weight for one day, and thereafter made a steady gain. No. 3 shows a heavy loss on the first, a noticeable increase the next day, followed by another decrease on the second day after being dehorned, and thence after, a constant gain. No. 4 shows the most striking loss in weight between March 2d and 7th, of the four animals, dropping from 1156 to 1075 pounds.

All of the above animals received the same kind of grain food, but 1 and 2 were fed ensilage, while 3 and 4 were given wheat straw, and this may account for the change in weight. Further, the rough food had been changed but recently preceding dehorning, 1 and 2 having been changed from straw to ensilage, and 3 and 4 from ensilage to straw. Hence these figures must be taken with consideration, and may not mean that the animals lost flesh from having undergone dehorning.

None of the four had much appetite for either water or dry feed at 6 P. M. of March 23, the day of dehorning, and No. 3 seemed somewhat indisposed for several days after. As late as April 1st one horn of this animal gave off a slight translucent, mucilaginous substance. It was further noted that those animals who appeared to suffer most from dehorning handled the head carefully about the manger at first, and would shake it slightly at times during the three or four days succeeding the operation, as though it irritated them.

Prof. Plumb concludes that their experiment indicates that the amount of suffering from dehorning depends very much upon the age of the animal, and the character of the horn, as we will endeavor to show in the engravings here presented.

A represents the horns from a steer of 22 months. These horns were cut off and taken to a professional artist the same day and drawn in colors at once. The illustrations of the three sets are slightly reduced. In A, 1 is a thin, hard, oily-appearing covering that entirely surrounds the bone. Fig. 2 is a thick, fleshy substance that extends a slight distance up the horn, this being the material that makes so

many horns thick at the base; this layer is quite yielding to the touch. Fig. 3 represents the true bony tissue of the horn, with the cavity in the center; this tissue is very porous.

B represents a cross section of the horns of an animal four years of age. The outer layer is 1; the next or fleshy is 2; and 3 the inner bony tissue. B and C were drawn after the horns had been cut some days, so that the fleshy matter had shrunk some. However, in an animal four years of age, in our experience, the layer of flesh about the base of the horn is not so thick as that in a younger animal. Further, the animal that appeared to suffer most from dehorning was the steer 22 months old, whose horns are figured at A.

The horns shown at C are from a cow 10 years old, and present but two striking layers, viz: 1st, the outer, hard, bony shell of the horn proper, and 2d, the bony structure within. There was almost no flesh about the base of the horn. This animal appeared to suffer dehorn-

for they conclude: "It seems clear that there are circumstances in which it is better for certain animals to be without rather than with horns, but as to which ones no person is so capable of judging as the one having the care of the herd."

PERSONAL.—We had a call on Tuesday from the well known New York Merino grower W. G. Markham, and our California veteran agriculturist, John D. Patterson. It is 10 years since Mr. Markham made us his last call, and then he was on his way to Japan with a fine selection of American sheep. Now he visits California on his way to Australia to look into the sheep interest there. Recently there have been quite considerable shipments of American Merinos to Australia by way of London, and the desirability of American-bred sheep is well recognized there. If the Australian wool interest is to be advanced and the American destroyed by the free-trade movement, it will

CROSS SECTIONS OF HORNS REMOVED IN DEHORNING.

ing none at all. So far as our experience will enable us to judge, the three sets of horns, A, B, and C, represent distinct conditions of development, and that the operation of dehorning becomes less and less painful as we approach C from A. While there is liability of the wounds about the stump of the horn, in A, becoming sore, and maturing for some little time, as occurred in the case of a steer the same age as that of A, they rapidly heal where the amount of flesh is very slight, as occurred with C.

In no case was any substance placed over the part of the horns left on the head. As soon as the horns were removed the animals were returned to their stalls. The cavities in the stumps if left to themselves gradually fill up, first with blood and serum and later with bony tissue, and the hairs about the horns gradually cover the stumps.

Dr. Gallraith, the veterinary surgeon who attended the dehornings, gives the following as his formal decision on the practice:

As I am called upon to give my opinion as to dehorning cattle, I will say the operation of amputating the horns is very painful and not infrequently followed by evil results. It is surely a cruel practice, excepting for disease, fracture, faulty direction, deformity, and to diminish damages from vicious cattle.

Prof. Plumb and his associates of the Tennessee Agricultural Station seem to agree with Dr. Gallraith in his conclusions on dehorning,

make Australia the leading market for our finely bred sheep. We hope it will not come to that, for we should have use for our best animals within our own borders. It is, however, quite in accord with the American spirit of enterprise for Mr. Markham to go to the great island continent to inform himself of the condition and needs of the wool interest, and we trust he will have a pleasant voyage and safe return.

GLANDERS.—Though we have had quite a number of articles on glanders during the last few months, we are very glad to give place to the very interesting sketch of the disease by Dr. Buzard, which appears upon another page of this issue. Dr. Buzard in his practice in this country and in Great Britain has had opportunity to become exceptionally well informed on this dread disease, and his experience can be made of wide practical use in California, now that the malady seems to be cropping out anew or with increased violence in some counties. County boards of supervisors will do well to act promptly in the repression of glanders as provided by law. It should be resolutely stamped out just as soon as competent veterinarians determine the fact of its presence.

SIXTY sheep were frozen to death June 13th in the Sierras.

QUERIES AND REPLIES.

Silos and Ensilage.

EDITORS PRESS:—Will you or some one of your many correspondents have the kindness to give me some information in reference to putting up feed for stock in a "silo?" Would like some information in regard to the whole process of preservation. Is it necessary to add liquid to the feed after being put away? What kind of feed is best to put up? And at what stage of ripeness should it be cut? What is the best plan for making a receptacle for the ensilage?—ENQUIRER, Winters, Cal.

We have, during the last few years, given drawings and descriptions of different kinds of silos, generally those constructed in France or in the East, because very little has been done with the silo in California. J. R. Jewell of Petaluma has done more with ensilage than any other Californian, and his practice and appliances were described in the RURAL of June 19, 1886. His silo was made of stone cemented on the inside, with a cement floor and a stone drain to carry off any water which might collect beneath, as his silo was in a side hill. Recently at the East, silos of plank, wholly above ground have become popular, and they are most cheaply constructed. The essentials of construction are tight walls of whatever material and a well-weighted cover which sinks as the fodder shrinks and thus keeps it well compressed.

Concerning the value of the silo in California Mr. Jewell says: "In a climate like this, where hay can be made from grain and the grasses with so little risk of loss or damage through rains or exposure, I would not recommend the building of silos, but for those who possess low bottom lands, adapted to corn culture, could largely increase their supply of feed to advantage by the use of silos."

Our own judgement of the matter agrees with Mr. Jewell's and we would add to his statement the other consideration that the climate favors the growth of squash and beets, etc., and as the absence of frost does away with the need of housing them, there is less to gain from silos than in wintry lands where the growing season is short and the freezing season long. However, there may be use made of the silo even here.

No liquid is added to the material in the silo. To answer our correspondents queries further, we make use of a condensed statement from an Eastern exchange, reviewing the condition of ensilage up to date.

Silos may be made with any of the various building materials, and some very crudely and cheaply constructed have been found to do good service. Silos may be above ground or under ground, or partly both; they should be water-tight, and preferably air-tight and frost-proof, although these two points are not essential.

The situation and construction of the silo and the arrangements for filling, covering and emptying, should be largely governed by local conditions. Several small silos, independent or connecting, are better than one large one, and the depth should be considerably greater than the length, width or diameter.

A silo that will prove efficient may therefore be built at a cost varying from 25 cents to \$5 for every ton of ensilage it will hold. But, like an ice-house, a well-built structure, costing about \$2 per ton capacity, will probably prove in the end the most economical.

Silos may be filled slowly or quickly, in all weathers, the forage plants cut or pitted whole, and the cover may be heavily weighted or not weighted at all; the ensilage produced will vary in condition and quality, but these variations of management do not materially affect the result. If the silo is not air-tight on the sides, however, it must be well covered and heavily weighted.

Any plant or vegetable product good for cattle food when green or fresh may be preserved as ensilage, in an edible and succulent condition, throughout the year, or for several years.

As a rule, all horses, mules, neat cattle, sheep, swine and poultry are fond of ensilage, if its material is ever such as eaten by them. Most farm animals prefer it to the best dry forage.

The best time at which to cut any growing plant to make good ensilage is when the plant approaches maturity and has begun to decrease in the percentage of its water contents.

The cost of preserving a given crop as ensilage does not materially differ from curing the same crop by drying, in a suitable season; but crops can be siloed and preserved in seasons when they would be lost if drying was attempted.

All considered, Indian corn makes the most economical and satisfactory ensilage in most parts of the United States, and with a crop of 20 to 25 tons to the acre, when cut, which is a good average, the ensilage may be made, ready for use, at a total cost of \$2 per ton, and for less, under favorable circumstances. An acre of corn as ensilage will weigh four times as much as the same crop dried as fodder. An acre of corn, field cured, stored in the most compact manner possible, will occupy a space 8 or 10 times as great as if in the form of ensilage.

The chemistry of the silo is still somewhat in the dark. The contents of any one silo filled with crops from the same land, apparently managed in the same way year after year, will differ in condition and quality in different years. Knowledge of the subject is not yet accurate enough to prescribe with certainty the proceed-

ure which will insure the best ensilage. Yet any forage crop can be preserved in a moist, fresh form, substantially unimpaired as food, although there is generally a considerable loss in the carb-hydrate elements, and with sometimes a partially compensating gain in the percentage of protein and an increase in the digestibility of the material.

Red-Polled Cattle.

EDITORS PRESS:—I see in your paper of June 16th inquiry in regard to red-polled cattle. I have a red-polled bull that I imported. He is about 2½ years old. I bred him to 11 Devon cows when but 15 months old. Have 11 calves. They are all muleys but one. I am well satisfied with the calves. I am importing another bull and some cows and heifers. I expect that they will be at my place near Petaluma in about two months. H. MECHAM.

Petaluma, June 21st.

[All our stock-breeding readers should place their cards in our Breeders' Directory for the information of those who are seeking new and improved blood.—EDS. PRESS.]

Cuyama Valley and Carissa Plains.

EDITORS PRESS:—The Cuyama and Carissa plains are settling up very fast. It is not quite a year since the first settler on Government land erected his cabin there, and to-day one can count more than 20 from Mr. Stubblefield's house.

The Cuyama valley is situated in the north-eastern corner of Santa Barbara county, the Cuyama river being partly the divide between Santa Barbara and San Luis Obispo counties. The soil is very rich and seems to be very well adapted for growing wheat. This should, in our opinion, be sown very early—about in November—so as to allow it to take root sufficiently before the winter sets in. It is pretty cold in winter, which, at an elevation of nearly 2000 feet, is not to be wondered at.

There is an abundance of artesian water and good springs, although the latter are, I am sorrow to say, nearly all taken in by land-grabbers. In some spots we observed much alkali, especially where the land was much drenched with water. In these places alfalfa grows to perfection without irrigation. Carr & Haggin have a large area in alfalfa, which they cut four times a year for hay.

Peaches and grapes do well, the first being of Placer county flavor. So far, of course, very little has been done in fruit-raising or cultivation, and farming is hardly more than experimental.

In the lower end of the valley wood on the south slopes of the mountains is plenty, mountain oak being prevalent. The upper end, especially the north side hills and the Carissa plains, are entirely destitute of trees. If water could be obtained, the Carissa plains would be converted into the best of raisin vineyards. The soil consists of the reddish sediment which we found in the Redlands, near Los Angeles, and in Sonoma. We believe that artesian water will be found at a depth of 150 to 200 feet, as this plateau lies that much higher than the Cuyama and Bakersfield plains, both of which seem to get the water of the mountain ranges inclosing the Carissa. Well-water has been obtained, though further north in the valley, at a depth of 25 to 30 feet (solid adobe) in various places.

It would now, of course, be unprofitable to attempt grain-growing here on a large scale, the markets being too far distant and hard to reach—to Bakersfield, on a good road, 75 miles; to San Luis Obispo, and to Santa Maria, over a very bad one, 65 miles in the bed of the Santa Maria river. But it is only a question of time when we will hear the whistle of the engine in the Carissa and Cuyama; meanwhile the settler will have to try to raise cattle on his 160 acres, and whether this can possibly be done at a profit without water and large means we don't dare to decide. J. G. H.

Santa Barbara, June 16, 1888.

EL VERANO.—An advertisement in this issue announces the sale on Saturday, June 30th, of lots in the new town of El Verano in Sonoma valley. We call the attention of our readers to this offering in one of the oldest and best known fruit valleys of the State. It has the advantages of well-tested resources, and any one who will visit the valley can see exactly what a splendid horticultural region it is. The sale is in charge of Briggs, Ferguson & Co., who made such a success of the Merced sale, as described in our columns at the time. The title is assured by the Pacific Improvement Co., a well-known organization. Parties looking for a rural home should not overlook the opportunity at El Verano.

STOCK FOR JAPAN.—Col. Peter Saxe reports shipment to Sapporo, Japan, nearly 400 miles from Tokio of 25 Berkshire swine all registered; one Devon bull registered, and three Bronze turkeys, the gobblers weighing 50 pounds and hens 30 pounds at maturity. These were forwarded on order for the Japanese Government, the stock to be placed on Government premises, of which W. P. Brooks (of Boston) is superintendent. This shipment and others like it show the esteem in which California stock is held in Japan and how California breeders may be profited by supplying the Japanese thoroughly good animals.

HORTICULTURE.

Nevada County Fruit Notes.

EDITORS PRESS: I have had several inquiries already about my ability to solve the prune problem this season; I have the pleasure to state that I will very likely be able to tell with certainty this fall whether we will be able in California to grow the same sized prunes from the same variety (the D'Ente) as they do in that privileged prune district in France, the valley of the Lot. My own imported trees from that valley, and from the very choicest types grown there, have enough fruit on this year to satisfy me as to our ability to grow or not to grow such nice D'Ente prunes in California as they do in France. I have taken extra care of my trees so that if the result is not satisfactory I will be certain that it will not be due to bad care. So I expect this fall to give your readers a full account of my experiments with results, good or bad, as the case may be.

The outcome for a heavy crop of fruit of all kinds is good in this part of the State. Of course, the codlin moth is bothering us, and apples are first to suffer as usual. Some people had an idea that the cold spell of last winter had made quite a havoc among the insect pests of our gardens, and had cleaned out the codlin moth. That belief was substantiated by such foolish articles as the following one clipped from a local paper: "The codlin moth and other fruit pests are kicking harder than any animal's thing because of the cold weather. The cold is causing many of them to give their 'death kick.' No such thing did happen for the codlin moth larvae in its warm little silk cocoon hermetically closed, and under the rough bark of trees, laughed at the cold weather. Upon my own place, with the thermometer 8° above zero, the lowest I ever saw it here, I took several larvae of the codlin moth from under the bands that I had kept around some of my trees, to my office, at a temperature of 60°, and I assure you that they were not long to spin some kind of a cocoon in a corner of the box they had been unceremoniously dropped in. Before publishing such incorrect and misleading items, editors should investigate first. It is safe to say that we will have from now on as we have had in the past, to wage war on these pests of our orchards."

I noticed that fruit of all kinds and nuts, except almonds, had quite a tendency to drop off this year, as I never saw it before; and it was not due to late frosts either, for we had none whatever this spring. Was it caused by the intense cold weather of last winter? The almonds are doing splendidly. I have a large Princess or paper-shell tree which I had to prop up, so heavily loaded it is. The Laquedoc is certainly the hardiest of all, at least in our mountains. Chestnuts are right now in the middle of June out in bloom and full as can be. The intense cold of last winter, nearing to zero in this vicinity, has done no damage to fruit or nut trees except olives and figs, which were more or less hurt. Olives, I noticed, and figs too, stand the cold well enough down to 20° above zero; below that point the trees are liable to be badly injured if not killed down to the ground. FELIX GILLET.

PALM VALLEY!

TROPICAL WONDERLAND!

EARLIEST FRUIT LAND IN THE WORLD.

EARLIEST VEGETABLE LAND IN THE WORLD.

FINEST WINTER CLIMATE IN THE WORLD.

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?

DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?

DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?

DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND COMPANY

Has secured 2000 acres of this choice land; has subdivided it into 5 and 10-acre lots, which they are now selling at \$200 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. Two hundred acres have now been sold on this basis, starting at \$150 per acre. The price is now \$200 per acre.

The Company has a Stone-walled Irrigating Canal, over ten miles in length, completed.

They have completed a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the town site owned by the Company.

They are planting 160 acres to an orange grove, of Navel oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State.

No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

THERE IS NO FROST, NO FOG, NO HARD WINDS.

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

BRIGGS, FERGUSON & CO., 314 California St., S. F.

NOTE.—Excursion Tickets can be had at \$1 each if purchased at the office of Briggs, Ferguson & Co. prior to the day of sale.

EXCURSIONISTS FROM WAY STATIONS CAN OBTAIN EXCURSION TICKETS OF OUR AGENTS ON THE TRAIN.

FRUIT MARKETING.

Auction Sales of California Fruit.

The first auction of California fruit in Chicago, June 21st. Two cars were sold, one bringing \$1120 and the other \$1230. The cars were delayed in transit and the prices secured were considered satisfactory in view of the delay.

The second sale in New York occurred on Wednesday, June 20th, and consisted of a carload of plums and apricots. The telegram received is as follows:

The car was delayed nearly three hours, and consequently most of the buyers were unable to wait in the auction-room and prices did not come up to expectations. The plums were small and the apricots dead ripe. They seem to have struck East just in the heated spell, and having been too ripe when picked, could not stand the weather. When exposed in the auction-room they showed up very soft, and some cases were leaking juice. The apricots brought from \$1.85 to \$1.50 per crate. The plums ranged from \$1.95 to \$1.30 per crate. On Monday a carload of 950 boxes of peaches, sent here from Chicago, was sold at auction, realizing from \$1.25 to 90 cents per box. They were soft, and showed considerable decay.

Later sales are given in our market reports.

Auction Rules in Chicago.

The following circular letter was issued at Chicago on the 16th inst., by Richard M. Montgomery & Co., the auctioneers who sell the fruit of the Union:

Gentlemen: We beg to inform you that we have perfected arrangements with the California Fruit Union, through the Porter Bros. Co., their agents in Chicago, to sell by auction all the California fruit shipped to this market by the Union.

The fruits of the California Fruit Union, as a rule, are shipped from the best and largest orchards and vineyards in California, and packed by the most reliable and experienced shippers.

As about 75 to 85 per cent of the deciduous California fruits received in Chicago are shipped by the Fruit Union, our offerings at auction will be necessarily large and most attractive.

Auction sales will be held every week day, at 8:30 A. M., at the commodious depot of the Northwestern railroad, Galena Division, foot of State street, Chicago.

The fruit will arrive at the depot every morning at 6 50 o'clock, and will be promptly arranged and exhibited so that the buyers will have time to examine every box offered and bid intelligently at the time of sale.

The fruit when received will be thoroughly examined and graded by competent inspectors, and each grade will be sold separately.

All the sales will be positively without reserve, and every lot will be sold absolutely to the highest bidder. All bidders and buyers will have the same privileges, and will all bid and buy subject to the same terms, conditions and regulations.

The terms of sale will be net cash, and the fruit will be offered in sufficiently large lots to protect jobbing interests.

At any time we will be pleased to give any information we possess concerning the fruit to be offered for public sale, and both by our catalogues and bulletins posted in the depot and our office, the trade can learn at any date exactly what fruit will be sold in the next two or three subsequent sales.

By this system the trade will be kept thoroughly informed as to the positive arrivals and sales of fruit.

The fruit offered under this system will comprise a large and attractive assortment of pears, peaches, apricots, plums, nectarines, cherries and grapes in their season.

With the inducements and advantages we offer to the trade, every Chicago jobber, shipper and commission merchant will have every facility to organize, develop and extend a large and profitable out-of-town business.

We would particularly emphasize the fact that we, as auctioneers, have a commission interest only in the fruit we sell. We are thoroughly disinterested parties, and every bidder and buyer will be treated with strict impartiality.

The first sale of fruit will take place Thursday, June 21st, at 8:30 A. M., at which time we will offer an assortment of peaches, apricots and plums.

A catalogue of this sale will be mailed to you at the earliest possible date.

If you find it inconvenient or impossible to attend the sales personally, we trust you will make arrangements to have your interests represented by some one of the numerous reliable fruit houses in this city, who will undoubtedly be pleased to bid for you and execute any of your orders for a moderate compensation.

Recognizing the growing demand for attractive lots of California fruit, we believe that our auction sales will extend to every wholesale fruit dealer the best facilities to make desirable purchases, and that every buyer at our sales will add to his business interests by patronizing our system of distributing fruit. Very respectfully,

RICHARD M. MONTGOMERY & CO.

THE society to import song birds into Oregon has sent 1000 marks to Germany for the purpose. Much interest in this object has been developed and funds for the same purpose are being subscribed by many of the interior towns.

News in Brief.

SALT LAKE CITY is to have an industrial school.

THE monument to Francis Scott Key in Golden Gate Park will be unveiled on the 4th of July.

THE expense of constructing the Lick Observatory as reported by the trustees, was \$577,242.26.

THE Lick Observatory was formally transferred to the Regents of the University on Wednesday last.

A LIBERAL bonus has been offered the Moss Bay Iron and Steel Co., to locate their works in Ellensburg, W. T.

A WOOD PULP factory has been started at Gridley, Butte county. Hon. Marion Biggs is president of the company.

THE clay model from which the bronze statue of Marshall, the discoverer of gold, is to be made, has been completed.

A FIRE at Sierraville on Saturday caused a loss of \$40,000, the entire business portion of the town having been destroyed.

DR. SKETCHLEY is making extensive preparations for ostrich raising on a large scale on his 2000-acre Tehama county ranch.

STARKE'S mill at Wheatport, in Contra Costa county, has a capacity of 9000 barrels per day, and is the largest flour-mill in the world.

GOV. WATERMAN has announced that he will not interfere in the case of Alex. Goldenson, convicted of murder and sentenced to death.

LISLE LESTER, a newspaper and magazine writer formerly of this city, died in New York on Saturday, and by her last request her body will be cremated.

POSTOFFICES have been established at East Riverside, San Bernardino county, and at Sanger, Fresno county, and A. J. Ranker and Wm. B. Muller appointed postmasters of the respective offices.

THE Chesapeake & Ohio railroad and the Old Dominion line are cutting rates to Chicago, Cincinnati and San Francisco. Tickets on both roads are hawked about at extremely low figures.

A COMMITTEE of the French Chamber of Deputies has passed a resolution to enter into a perpetual treaty with the United States for settlement by arbitration of disputes that may arise between our country and France.

IN Wyoming carrier pigeons are rapidly being introduced. They are used in sending messages between Laramie and the big ranches. Homing pigeons will doubtless soon be put to the same use everywhere in the big cattle ranges of Idaho and Montana.

THE lobsters, which were recently brought to this coast from Massachusetts for propagation, were temporarily placed in fish cars at Monterey. They have recovered from the effects of their overland trip, and give evidence of possessing a good healthy appetite. They are waxing strong and fat on a daily diet of fish. One hundred and sixty, one-half the number have been placed in Monterey bay, near Point Pinos. The remaining lobsters, about 160 in number, will be placed in two places north of Point Reyes, where, it is believed they will multiply and spread up and down the coast.

Rural Health Retreat.

A recent visit to this rarely successful institution (situated on Howell mountain slope, 24 miles easterly from St. Helena,) shows it to be in a more flourishing condition than ever before. Although the number of rooms for guests and patients has been doubled during the past season, all are well filled with patients and guests, some of whom have come from distant parts of the Union.

Dr. J. S. Gibbs has been quite successful in his treatment of many patients cured, and others greatly benefited, at this institution during the past few years. He is now ably supported by Dr. Collville and a number of attentive male and female assistants.

Dr. Collville gave a lecture on health last Sunday evening, which proved very instructive and highly appreciated by a full audience. Reliable information of this institution can be obtained by any person upon sending their P. O. address to the Retreat.

In our business department appears an engraving and further mention of this worthy institution.

THE arrivals of coal at this port last week were 40,000 tons, and as there is much more on the way it is probable that the "coal corner" will be broken.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JUNE 19, 1888

384,682.—OBTAINING PRECIOUS METALS FROM SPEISS—L. W. Davis, Eureka, Nev.

384,742.—DISK CULTIVATOR AND SEEDER—B. C. Dorsey, Tulare, Cal.

384,755.—DANGER SIGNAL FOR BRIDGES—M. O. Godding, Monrovia, Cal.

384,631.—SHAWL STRAP AND FIRE ESCAPE—Lee & Acton, Dal es, Ogn.

384,706.—PUMP—J. A. Murry, Tucson, A. T.

384,707.—GAME COUNTER—F. G. Nash, S. F.

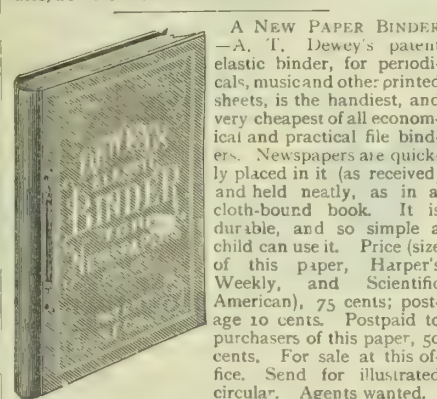

384,937.—FRED WATER HEATER—David Stark, S. F.

384,940.—PHOTOGRAPHIC CAMERA—H. Swain, S. F.

384,941.—STEAM GENERATOR—E. H. Thompson, Newark, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

A NEW PAPER BINDER—A. T. Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, and very cheapest of all economical and practical file binders. Newspapers are quickly placed in it (as received) and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price (size of this paper, Harper's Weekly, and Scientific American), 75 cents; postage 10 cents. Postpaid to purchasers of this paper, 50 cents. For sale at this office. Send for illustrated circular. Agents wanted.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

A 40-FOOT HARVESTER, believed to be the largest in the world, was lately shipped from the Benicia Agricultural Works to Visalia. It is to be driven by an engine of 40-horse power, which will be used to draw 24 twelve-inch plows, when harvest is over.

BERKSHIRE SALES.—Phil. M. Springer, secretary of the Berkshire Association, reports the transfer of Belle Roche Prince 11,955. Yamhill Maid 19 232, and Broadmead Duke 19 233, from Andrew Smith, Redwood City, Cal., to Ladd & Reed, Portland, Oregon.

WHOSE MONEY?—We received a letter from San Jose in which the writer sends several dollars in postage stamps to pay for subscription for the RURAL and for other publications of ours and does not sign his name to the letter. Who is it?

Carriages.

We are receiving 10 carloads of Carriages, Buggies and Wagons from the Briggs Carriage Company of Amesbury, Mass., which will be sold at prices that will be satisfactory, considering style and workmanship. Quality of material guaranteed the best.

M. A. BRIGGS & CO., 220 & 222 Mission St., San Francisco, Cal.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

GATHER SAMPLES OF GRAIN!

DURING HARVEST

AND OTHERWISE

PREPARE COUNTY EXHIBITS

—FOR THE—

STATE FAIR, 1888,

—AT—

SACRAMENTO, Sept. 3d to 15th.

\$2500 CASH PREMIUMS FOR COUNTY EXHIBITS,

IN ADDITION TO WHICH IS

\$1500 FOR INDIVIDUAL PREMIUMS

That may be competed for by the contributors to the County Collections. These exhibits are seen during the Fair by more than 50,000 different people, and are fully described by the press of the State, and written up in detail by the Committee of Awards, which report is printed in the Annual Report of the State Agricultural Society and distributed throughout the civilized world. In no other manner can the counties receive such a full, complete and comprehensive notice. The County Exhibits have proved the most effective means of advertising the resources, developments, and advantages of the different localities of the State, and should be made by authority and with the aid of the Board of Supervisors of each County. The State Agricultural Society will afford every facility for the exhibition of the products of the State, and would advise those intending to exhibit to WRITE FOR SPACE AT ONCE. The first come will be the first served. Premium Lists now ready. Address the Secretary for information.

S. H. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 27, 1888.

Warmer weather and clearer skies, with less dew at night, has caused fruits to ripen more quickly, and also creates a more cheerful feeling among orchardists who sun-dry. Harvesting is more general throughout the States, with crops being secured in good condition. Trading in farm products the past week was active, with good prices for the season very generally reported. The wheat markets abroad and at the East have been dull and lifeless. The following is to-day's cable:

LIVERPOOL, June 27.—Wheat—(Quiet, but steady, 6d; just shipped; 3s 6d; nearly due, 3s 6d; cargoes off coast, steady; on passage, quiet, but steady; French country markets, rather easier; wheat in Paris rather easier, flour steady.

California Produce at Chicago.

CHICAGO, June 23.—California fruits are selling moderately well, and bring good prices both in the stores and at auction sales. Peaches were in good supply. The demand was rather light, and even choice stock sold slowly.

Peaches in good order brought \$1.25@1.40 for 20-lb cases, and poor sell lower.

Plums continue plenty. They sold slowly and were easy. Plums and Royal Native plums brought \$2@2.50, with some extra higher.

Barlett pears bring \$2.50 per box. Apricots in 20-lb boxes sold at \$1.25@1.50. The supply of California is generally quite small and the inquiry is for small parcels. Trading continues at former prices and the market was quotably quiet and steady.

Apricots, sun-dried 1/2 lb., 8c@9c; do, bleached, prime 14c; do, bleached, choice, 15c; do, bleached, fancy, 15 1/2c; do, evaporated, choice to fancy, 14 1/2c@16c; peaches, sun-dried, 1/2 lb., 9c@10c; do, evaporated, 1/2 lb., 14c; do, evaporated, peeled, 1/2 lb., 16c@20c; plums unpeeled, 1/2 lb., 6c@7c; do, pitted, 10c@11c.

Raisins, loose Muscatels, 2-crown, 1/2 box, \$1.35@1.40; do, 3-crown, 1/2 box, \$1.45@1.50; do, London, 1/2 box, \$2@2.25.

Prunes, small, 1/2 lb., 6c; do, large 8 1/2c@9c.

The hop market is quotably firm. A very fair demand now exists. Choice hops are in light supply and the stock of ordinary grades is moderate. Pacific Coast, choice, 1/2 lb., 12@13c; do, common to prime, 8@11c.

Eastern Grain Markets.

The following shows the closing prices of wheat in New York:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	80	80	80	80	80
Friday	80	80	80	80	80
Saturday	79	79	79	79	79
Sunday	79	79	79	79	79
Monday	79	79	79	79	79
Tuesday	79	79	79	79	79

The closing prices for wheat have been as follows, at Chicago:

Day.	Cash.	June.	July.	Aug.	Sept.
Thursday	80	80	80	80	80
Friday	80	80	80	80	80
Saturday	79	79	79	79	79
Sunday	79	79	79	79	79
Monday	79	79	79	79	79
Tuesday	79	79	79	79	79

CHICAGO, June 27.—Wheat—88 1/2c for cash, 86 1/2c for July, 87 1/2c for August and 88 1/2c for Sept. Corn—49c for July.

NEW YORK, June 27.—Wheat—88 1/2c for cash, 86 1/2c for July, 87 1/2c for August and 88 1/2c for September.

California Fruit at New York.

NEW YORK, June 25.—Another lot of California fruit was sold to-day. It was all in good order. Peaches brought \$2.50@1.85; plums, \$2.95@1.45; apricots, \$1.75@1.55. A carload which was to have been sold on Saturday was held over and sold to-day. As was predicted the fruit was almost ruined by the intensely hot weather and prices were accordingly next to nothing. Bartlett pears sold for \$3.25; plums, \$2.10; apricots, 75c; peaches, 60c@55c. The apricots and peaches were melted, showing conclusively that no California fruit should arrive Saturdays.

Fruit Sold at Auction.

NEW YORK, June 26.—One carload of California fruit was auctioned to-day and the following prices were obtained: Bartlett pears, \$3.70; peach plums, \$3.25@3; peaches, \$1.62 1/2@1.50; apricots, \$1.50@1.12 1/2. This car arrived too late for yesterday's sale, and had to be held over. The weather is a little cooler and the fruit stood it well. Three carloads are announced for to-morrow.

Boston Wool Market.

BOSTON, June 22.—The state of the wool market in this city can be easily understood when it is stated that fully three-quarters of the trade left their offices to view a game of base ball between two nines made up from local traders. The week has been uneventful and was interrupted by the Bunker Hill celebration on Monday last. Transactions have been limited and values of all grades are nominally unchanged. Inquiries for delaine wool are reported, but stocks are small, and large lots are not available owing to the high prices asked. No demand of consequence is anticipated, as many New England mills are shutting down, and others are likely to join in the procession as soon as their orders are out. Their action is, of course, not unusual at this season, but the effect is felt more seriously on the demand for raw material because manufacturers are buying only as wanted. Transactions in this market are weak, aggregating 1,704,000 lbs. Receipts of the week have been 6633 bales of domestic and 334 foreign, against 17,767 bales domestic and 1563 bales foreign for the corresponding week in 1887.

Wool.

NEW YORK, June 24.—The Commercial Bulletin says of the wool market that the movement from the buying side is not a contributor of much strength to the market, the call running mainly in the old groove of handling merely enough for early wants and taking chances for the future. The mills have got along

very well for a year past by allowing supplies to remain in dealers' hands until wanted, and it is thought a reasonable policy to adhere to the system as much as possible. About the only movement of importance in wool at this point has been of Texas growth, and the prompt manner in which receivers part with it would seem to indicate that no great future in the early future is entertained. Indeed, holders generally meet the call as it develops without an effort to advance cost, and want more customers on the same basis. From primary points we learn that most of the fleeces are ready for market, with growers acting somewhat more conservatively. California is said to be fairly well sold up, and it is said that most of the wools coming eastward are to dealers, either on purchase or commission. Private cables from London sales report good Port Philip firm at 10 1/2d; cross-bred, 9 1/2d. English combing is stagnant, and carpet wools are unchanged.

Hops.

NEW YORK, June 24.—The new prices show a rather better outlook for hops. The top price for York State is 13c; for California 11c.

Local Markets.

BAGS—The forepart of this month a syndicate was perfected at the East to control jute bags in the United States. Since then the pool in this city has not only held stronger but asked an advance. Outside holders who sold for less money were cleaned up, and consequently prices have been advanced. It is said that several firms are still selling to their regular customers for less money than asked by the pool. The pool price for Calcuttas range from 7 1/2 to 7 3/4c.

BARLEY—The market is barely steady. Dealers are only buying in a hand-to-mouth way. Options have been exceedingly dull the past week. Prices have dropped so low that the bears do not care to hammer them still further. At to-day's Call the following are the reported sales:

Morning Session: Buyer 1888—100 tons, 91c; 100, 91c. Seller 1888, new—100 tons, 82c 1/2 c. Afternoon Session: Buyer 1888—300 tons, 91 1/2 c. 100, 91c.

BUTTER—Choice to fancy is scarcer and commands full figures. Poor stock sells slowly. There is more doing in pickled, as the warm weather causes distant buyers to take it in preference to fresh roll. Eastern continues to press the market.

CHEESE—The market is strong, under a good demand and moderate receipts.

EGGS—Throughout the week the market has been most remarkably steady.

FLOUR—The market is steady, with a good trade call ruling.

WHEAT—New No. 1 shipping sold the past week at \$1.32 1/2. Part Costa delivery. The tonnage load is steadily increasing. The market has been quiet the past week, with buyers trying to obtain concessions. Receipts at Port Costa are increasing under freer deliveries by farmers. In options trading on Call was light the past week, with prices lower yesterday. The following are to-day's reported sales:

Morning Session: Buyer 1888—200 tons, \$1.45; 200, \$1.45 1/2. December—100 tons, \$1.41 1/2 c. Afternoon Session: Buyer 1888—100 tons, \$1.45 1/2. 200, \$1.45 1/2; 100, \$1.45 1/2; 600, \$1.45 1/2. December—100 tons, \$1.41 1/2. 100, \$1.41 1/2 c.

[COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco, from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 '86 to June 25, '87	July 1, '87 to June 23, '88
Flour, qr. sks.	4,109,167	3,668,275
Wheat, cts.	13,135,239	8,347,079
Barley, cts.	2,263,697	2,305,742
Oats, cts.	135,189	159,869
Potatoes, sks.	864,015	1,133,248
Corn, sks.	133,868	245,186
Rye, sks.	28,184	18,850
Buckwheat, sks.	5,911	3,054
Beans, sks.	446,583	394,912
Bran, sks.	442,389	510,549
Hay, tons.	107,008	120,753
Salt, tons.	23,148	17,590
Wool, bales.	90,974	74,942
Hides, No.	110,377	106,715
Raisins, 20-lb boxes.	130,580	112,040
Quicksilver, flasks.	18,791	30,353
Hops, bales.	13,393	15,918

The receipts of certain articles of produce from Oregon, Washington Territory and other distant points, for the same period, compare as follows:

	July 1, '86 to June 25, '87	July 1, '87 to June 23, '88
Flour, sks.	257,760	433,116
Wheat, cts.	998,374	1,213,169
Barley, cts.	6,198	75
Oats, cts.	342,022	285,536
Corn, cts.	117,804	12,590
Wool, bales.	22,768	13,539
Bran, sks.	31,893	73,501
Hops, bales.	801	529
Hides, No.	37,703	33,330
Rye, cts.	5,827	5,827
Potatoes, sks.	144,834	82,365

Cereals.

At the end of May the cereal crops in the United Kingdom were backward, but as a rule were promising. There has been a lack of moisture in the soil, owing to the deficient rainfall during the last 15 months. The future of the crops will depend more upon the moisture that shall be supplied by the rain-falls and dew than to that stored in the soil. Such a year the deep-rooted plants, like wheat, thrive better than shallow-rooted plants.

The New York Produce Exchange Reporter says: According to the Bureau estimates the crop of winter wheat will amount to about 238,000,000 bu., and that of spring a little short of 162,000,000 bu., or a grand total of 400,000,000 bu., from which to deduct 60,000,000 bu. for seed and 285,000,000 bu. for consumption or an aggregate of 345,000,000 bu., leaving 55,000,000 bu. for exportable surplus, allowing the admittedly small quantity to be carried over this year to stand for reserves. In supposing, for sake of argument, that foreign countries will only need to import 55,000,000 bu. from the United States, is

putting it down to a very low notch, to say the least. Although exporters told us very seriously a year ago, that Europe was not going to require any appreciable quantity of wheat during the season of 1887-88 from this country, we have already cleared close to 80,000,000 bu. since September 1, and the total is likely to exceed 90,000,000 bu. before August closes. Hence if they took over 90,000,000 in a year, when we were told they "didn't want any," it is not unreasonable to venture the opinion they will take half or even three-quarters of that aggregate the ensuing season, even if they don't want any. Assuming that these deductions are anywhere near correct, we dare to hazard the opinion that at current prices, choice red wheat of hard spring cannot be regarded as fabulously dear. Of course, in what direction the option market may drift during the hot weather, is entirely problematical.

The test of the thrashing machine indicates that the wheat crop has been over-estimated fully one quarter in New Zealand. There was in January hot dry weather, when the wheat was in bloom, that caused great damage to the wheat crop. The quality and condition is good, but the yield per acre is the poorest for many years. Prices are ruinously low, and farmers find it difficult to make the ends meet. Lonnage is scarce. The farmers are being paid about 60@66c per bu.

H. Kains Jackson writes to the London Farmer as follows: Our exchanges are probably paying too little attention to the news from France. Our neighbor has not bought of American, Indian or Russian wheat very largely during the past few months, owing to her own large home yield; but with a deficient crop this summer France may easily require from two to three million quarters of wheat from all the three countries which are England's main sources of supply. The pressure of competition with France and Italy might send up prices very materially, and it is therefore important to note that the backwardness of the crops in France is becoming more and more apparent. At the end of May wheat is not in a more advanced position than it ordinarily occupies at the end of April, the situation is so much the more disquieting from the fact of the weather having been very unfavorable for the tillering of the plant, and consequently the fields are generally patchy, especially on the light soils. It is now accepted by farmers that even a fine June cannot prevent the crop of 1888 proving inferior to that of last year.

The closing sales on the San Francisco Call Board were as follows:

Date.	Buyer Season.	Buyer Year.
Thursday	81.36	81.36
Friday	81.46	81.46
Saturday	81.52	81.52
Monday	81.45	81.45
Tuesday	81.45	81.45

FEEDSTUFF.—The consumption of ground feed is increasing, but the market does not strengthen, owing to liberal supply—bran and midlings from Oregon, and ground barley from this State.

Under heavy receipts, considerably in excess of consumption, hay is weak, with a lower range of quotations reported. Very few dealers will carry large stocks at this season of the year, owing to the danger of fires and also to receipts being free, unsettling prices. The consumption continues large.

Hops.

The market for futures has a firmer tone, but then it is difficult to get quotations. Spot parcels of choice are hard to get. The consumption in this State so far this year has been very light owing to the cool weather. The Mark Lane Express, June 4th, reports the English crop prospects as follows: Although the bine has grown fairly well during the past week, it is still in a very backward condition for this time of the year; there is a great lack of cultivation, and the hop gardens are evidently quite out of heart, many not having been mowed for the past three years; but the most serious feature that we have to note is the appearance of a few fly in the Weald and Mid divisions of Kent, although this is by no means general yet. Two, three, four, and five fly have been found upon a leaf in the neighborhood of Laddock Wood; in the present weak and backward state of the plant, the aphid fly would do a great amount of damage, especially now that so few farmers can afford the outlay of washing. With regard to the market, it remains exceedingly firm, choice hops being scarcer than ever.

The local wheat market ruled dull and inactive throughout the past week, with no change of moment looked for until the character of the crops abroad and in the United States are more fully determined. All present indications point to a short crop not only in the United States but also in Europe, particularly in Austria-Hungary and in France. With the crop, taking all the wheat-growing countries as a whole, throughout the world, short, and the carry-over of old small, it seems next to an impossibility to keep values down any material length of time. The stock of choice old wheat on this coast is light while the crop is all of 100,000 tons less than in 1887 and the tonnage in sight to carry the surplus away is largely in excess of this time in 1887. The returns from harvesters in this State report the outturn spotted and decidedly irregular. While in some localities the yield is above an average in other localities they are barely an average while in others again it hardly paid to harvest the grain. Oregon advices do not report any material change since our last week's issue.

Barley has come in only fairly the past week, barely up to requirements, which necessitated drawing on warehouse stock. The supply of choice is light, but then the Call is light which keeps values from advancing, particularly with harvesting well under way. The yield and grade of barley, like wheat, is spotted and irregular. There is a growing impression that after farmers who are forced to sell dispose of their crop, or at any rate a part, and others have warehoused theirs, the market will advance for the crop of the coast is short and the consumption steadily increasing.

Free receipts of oats the past week weakened the market still more. To save expenses several consignments were sold on the wharf at concessions on current quotations. Crop advices are unchanged. Corn under freer receipts is easier, with some

shading in prices. Crop advices continue favorable.

The market is dull and weak for both rye and buckwheat. New rye sold at \$1.60.

At the end of the season, with harvesting underway and the midsummer holiday and vacations at hand, the market for all kind of cereals is hard to report correctly, and still more difficult to quote, for quotations are more or less nominal and governed from day to day by the urgency of the demand or selling.

Live-Stock.

The market for dressed meat is quotable as follows by slaughterers to butchers (to get the price of stock on foot, take off one-third of the price for stall and grain fed and one-half from the price of grass fed, that is, animals running at large.)

HOGS—On foot grain fed, 6 1/2@6 3/4c 1/2 lb.; dressed, 9 1/2@10c 1/2 lb.; soft, 5 1/2@6c 1/2 lb.; dressed, 8 1/2@9 1/2c 1/2 lb. Stock hogs, 4@5 1/2c 1/2 lb. BEEF—Stall fed, 8@8 1/2c 1/2 lb.; grass fed, extra, 7@7 1/2c 1/2 lb.; first quality, 6 1/2@6 3/4c 1/2 lb.; second quality, 6@6 1/2c 1/2 lb.; third quality, 5@5 1/2c 1/2 lb. VEAL—Choice 8@9c 1/2 lb.; fair to good, 6@7c 1/2 lb. MUTTON—Wethers, 6 1/2@7d 1/2 lb.; ewes, 6@6 1/2c 1/2 lb.; lamb, spring, 8@9c 1/2 lb.

Choice bullocks and mutton sheep continue scarce, with an advance in the latter, owing to the warmer weather being more favorable to their consumption. That is, butchers can sell them quicker, thereby not losing so much. Hogs are scarcer and higher. In horses there is nothing new to report. Last week's report covers this week's advices regarding the market.

Poultry held strong throughout the past week under light receipts and a good demand.

Honey continues slow with more or less of a deadlock reported.

Hides are improving at the East.

Wool has a stronger tone for the better and more desirable clips. Some dealers report they are able to get a slight advance on last week's prices. Common, dirty and undesirable wool drag.

Vegetables.

The demand for garden truck is not very good, owing to peas being, as a rule, too old for general use, tomatoes too high for canners, and cucumbers too high for picklers. Other vegetables are without much change. Canners are still buying beans at from 3/4c to 1 1/4c per lb.

The demand for potatoes having fallen off from the more distant points, stocks accumulate under freer receipts, necessitating lower prices to induce buying. The quality of this year's potatoes appears to be better than last year's.

Onions continued to strengthen the past week, although at the close a further advance appears to be checked, under freer receipts, and buyers not disposed to take hold so freely.

Fruits.

Orchardists should always keep three things in view in marketing fruits, viz.: First, canneries and also dealers pay the best prices for fruits not too ripe, well selected, and of as even size as possible. The finding of either small-sized or soft fruits below the first two or three layers condemns the entire shipment and causes buyers to bid down. Second, they should advise the firm to whom they ship a day in advance of a free shipment how much they intend to send, quality, size of boxes, etc., which will allow the merchant an opportunity to have buyers for the consignment. Third, it is impossible for any one to give correct quotations of the market, for the writer has known early received in the day fruits to command higher prices than those that come in later on in the day, and then I have seen the early received sell for less money than those received later on. Again some commission merchants will sacrifice one man's consignment for that of another who is a larger grower. Soft fruits are only taken by trucksters or canners, the former to peddle them and the latter to can pie fruits, and consequently there not being much competition, they sell low. The practice is failing to sell the entire crop either in the field or f. o. b. (free on board) of cars to either a dealer or canner, than to take chances in marketing the fruit from day to day.

Cherries are in lighter supply, but then prices do not show much improvement. Dealers are running chiefly on other fruits, and canners only buy certain varieties. Canners continue to pay prices heretofore given.

Apricots have a wide range. I saw some taken by canners which were too soft for fine canning at prices ranging from 1c per lb. up to 1 1/2c, and some better selected and firmer taken by the same canner at a range of 2c to 2 1/2c. The market for apricots of good size and firm is strong.

For peaches canners pay from 1 1/4 to 1 1/2c per lb. f. o. b. the cars, and the same for pears, although it is stated that 2c is paid for better selected. For plums, I do not at this writing hear prices named to canners. The light crop of fruits in France is helping our market for canned fruits. During the past ten days over 30,000 cases have been sold for shipment to England. The demand for canned fruits from the East is increasing, causing a better feeling and strengthening prices for all kinds of fruits. The shipment of fruits to the East are still on a large scale.

In currants canners are buying at \$1.75@2.25 per chest, and the trade at \$2@3, and at times slightly more. In other berries the market is without change. The advance in canned strawberries at the East causes a slightly more increased attention to be paid to the berry by canners here. The market from day to day is regulated by the demand and supply.

In dried fruits there is nothing doing. The warmer, clearer weather allows more sun-drying. It is thought that a good demand will rule for the new crop, particularly as the market is well cleaned up of old both here and at the East.

Raisins are cleaned up. The market is in good position for new crop both here and at the East.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

HORTON & KENNEDY'S

FAMOUS
ENTERPRISE
Self-Regulating
WINDMILL

Is recognized as the
BEST.

Always gives satisfaction. SIMPLE,
STRONG and DURABLE in all parts.
Solid Wrought iron Crank Shaft
with DOUBLE BEARINGS for the Crank
to work in, all turned and run in ad-
justable babitted boxes.

Positively Self-Regulating,

With no coil springs, or springs of any kind. No little
rods, joints, levers, or anything of the kind to get out of
order, as such things do. Mills in use 6 to 12 years in
good order now, that have never cost one cent for repairs.
All genuine Enterprise Mills for the Pacific Coast trade
come only through this agency, and none, whether of
the old or latest pattern, are genuine except those bearing
the "Enterprise Co." stamp. Look out for this, as
inferior mills are being offered with testimonials applied
to them which were given for ours. Prices to suit the
times. Full particulars free. Best Pumps, Feed Mills,
etc., kept in stock. Address,

Railroaders and Farmers use no other.

MERY'S IMPROVED PIONEER

BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

VALUABLE IMPROVEMENTS HAVE BEEN
ADDED THIS YEAR.

This Mill has been in use on this Coast for 7 years,
TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor,
there now being

Over 225 of them in use in California, Nevada & Oregon.
It is the most economical and durable Feed Mill in use. I am sole manu-
facturer of the Corrugated Roller Mill. The Mills are all ready to mount
on wagons.

CHICO, CAL., Feb. 1, 1887.

M. L. Mery, Esq.—DEAR SIR: The No. 14 Barley
Crusher bought of you and used in the California Mills,
gave entire satisfaction; have crushed 8000 pounds an
hour. I have also crushed as much or more on set 10x20
when working for General Bidwell, which set he is using
in his mill to-day. Yours truly,
GEO. SHAND.

ORLAND, CAL., August 5, 1887.

Mr. M. L. Mery—DEAR SIR: In reply to yours of
August 1, 1887, regarding the mill I bought of you, would
say that the No. 2 gives perfect satisfaction, and that I
can crush from 1000 to 1200 sacks of Barley per day. I
will recommend it to the public for good work and lots
of it. M. C. DILLMAN.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY, Chico Iron Works, Chico, Cal.

Booth's Sure Death Squirrel Poison

For Squirrels, Gophers, Birds, Mice, Etc.

Endorsed by the Grange and Farmers wherever used.

The Cheapest and Best.

Put up in 1-pound, 5-pound, and 5-gallon Tins.

Every Can Warranted.

This Poison has been on the market less than two years, yet in
this short time it has gained a reputation of "Sure Death,"
equaled by none. By its merits alone, with very little advertis-
ing, it is now used extensively all over the Pacific Coast, as well
as in Australia and New Zealand.

For the last 14 years the H. H. H. Horse

Liniment has been the leading remedy

among Farmers and Stockmen for the

cure of Sprains, Bruises, Stiff Joints,

Grains, Windgalls, Sore Shoulders, etc.

and for Family Use is without an equal.

For Rheumatism, Neuralgia, Aches, Pains,

Grains, Cuts and Sprains of all characters.

The H. H. H. Liniment has many imit-

ations, and we caution the Public to see

that the Trade Mark "H. H. H." is on

every Bottle before purchasing. Price

everywhere from 50 cents to \$1.00 per

Bottle.

For Sale by all Druggists.

The BUYERS' GUIDE is
issued March and Sept.,
each year. It is an ency-
clopedia of useful infor-
mation for all who pur-
chase the luxuries or the
necessities of life. We
can clothe you and furnish you with
all the necessary and unnecessary
appliances to ride, walk, dance, sleep,
eat, fish, hunt, work, go to church,
or stay at home, and in various sizes,
styles and quantities. Just figure out
what is required to do all these things
COMFORTABLY, and you can make a fair
estimate of the value of the BUYERS'
GUIDE, which will be sent upon
receipt of 10 cents to pay postage,

HAY PRESSES!

THE HURRICANE—Size A.

A mounted, horizontal double-ender. Size of bale,
when in the press, 17x22 1/2 inches. Average weight of
bale, 220 pounds. Capacity, from 16 to 25 tons per day.
Uses 4 men and works with 2 horses. Requires no
tramping. Puts 10 tons or over in a box car.

Price.....\$1000.

THE HURRICANE—Size B.

Size of bale in press, 22x24x46 inches. Average
weight of bale, 260 pounds. Capacity, from 20 to 35
tons per day. Uses 5 men and works with 1 or 2 horses,
at option of baler. Requires no tramping. Uses rope
or wire. Puts from 7 to 8 tons in a box car.

Price.....\$1000.

The SELF-TRAMPING JUNIOR MONARCH

Size of bale in press, 22x24x46 inches. Average
weight of bale, 260 pounds. Capacity, from 15 to 25
tons per day. Uses 3 or 4 men, at option of baler.
Works with 1 or 2 horses. Uses rope or wire. Does its
own tramping. Puts from 7 to 8 tons in a box car.

Price.....\$500.

THE MONARCH.

Same principle as Junior Monarch, only smaller and
heavier. Size of bale, when in press, 17x20x40 inches.
Average weight of bale, 220 pounds. Capacity, from 12
to 20 tons per day. Requires 3 men and 2 horses. Uses
wire only. Rope will not hold. Does its own tramping.
Puts 10 tons or over in a box car.

Price.....\$600

THE GENUINE PRICE PETALUMA.

Size of bale in press, 24x24x50 inches. Average
weight of bale, 250 pounds. Capacity, from 10 to 15
tons per day. Requires 4 men and 2 horses. Uses rope
or wire. Hay has to be tramped into the press. Puts
from 5 to 6 1/2 tons in a box car.

Price.....\$350.

THE IMPROVED EAGLE.

Size of bale in press, 26x26x60 inches. Average
weight of bale, 235 pounds. Capacity, from 10 to 15
tons per day. Requires 4 men and 2 horses. Uses rope
or wire. Hay must be tramped in the press. Puts from
4 1/2 to 5 1/2 tons in a box car.

Price.....\$250.

The above is the finest line of Baling Presses in the
United States. They are nearly double the capacity of
those of other makers.

For large, illustrated Catalogue of the same, ad-
